COMMITTEE ON AGRICULTURE.

HOUSE OF REPRESENTATIVES.

GILBERT N. HAUGEN, Iowa, *Chairman.*

JAMES C. McLAUGHLIN, Michigan.

GORDON LEE, Georgia.

SYDNEY ANDERSON, Minnesota.

EZEKIEL S. CANDLER, Mississippi.

WILLIAM W. WILSON, Illinois.

J. THOMAS HEFLIN, Alabama.

CHARLES B. WARD, New York.

THOMAS L. RUBEY, Missouri.

WILLIAM B. McKINLEY, Illinois.

JAMES YOUNG, Texas.

ELIJAH C. HUTCHINSON, New Jersey.

HENDERSON M. JACOWAY, Arkansas.

FRED S. PURNELL, Indiana.

JOHN V. LESHNER, Pennsylvania.

EDWARD VOIGT, Wisconsin.

JOHN W. RAINEY, Illinois.

MELVIN O. McLAUGHLIN, Nebraska.

EVAN J. JONES, Pennsylvania.

CARL W. RIDDICK, Montana.

J. N. TINCHER, Kansas.

J. KUHIO KALANIANA'OLE, Hawaii.

L. G. HAUGEN, *Clerk.*

AGRICULTURE APPROPRIATION BILL.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Tuesday, December 9, 1919.

The committee met at 10.30 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. The committee will come to order. I have called the committee together this morning to consider the estimates of appropriations for the Department of Agriculture required for the service of the fiscal year ending June 30, 1921, submitted by the Secretary. Full and open hearings will be held on the estimates during which we will have before the committee representatives and chiefs of the various bureaus of the department, as well as others interested in the various items who may wish to appear and be heard. The policy will be to scrutinize each item in the estimates most carefully with a view of practicing strictest economy, but of course allowing all just increases which will tend to promote agriculture.

We have with us this morning Mr. Harrison, assistant to the Secretary, from whom we will be pleased to hear first.

SUMMARY OF ESTIMATES.

STATEMENT OF MR. F. R. HARRISON, ASSISTANT TO THE SECRETARY, DEPARTMENT OF AGRICULTURE.

Mr. JONES. May I ask Mr. Harrison just what official position he has?

Mr. HARRISON. Assistant to the Secretary.

Mr. JONES. Of the Department of Agriculture?

Mr. HARRISON. Yes, sir.

Mr. JONES. What are the initials?

Mr. HARRISON. F. R.

Mr. TINCHER. What estimates are you going to discuss?

Mr. HARRISON. The regular annual estimates of the department. I will merely make a general statement to the committee about the estimates as a whole. The estimates for the fiscal year 1921, which you are about to consider, aggregate \$37,528,102, compared with \$33,899,761, the amount carried in the appropriation act for 1920; that is, the current fiscal year. They involve an apparent increase of \$3,628,341. Taking into account, however, the fact that \$121,229 is merely transferred from other acts (the sundry civil and the wheat-price guaranty acts), the net increase is only \$3,507,112. It should be pointed out, also, that the item of \$1,000,000 for fighting and preventing forest fires (an increase of \$850,000 over the present

appropriation), the item of \$1,000,000 for combating foot-and-mouth disease, and the item of \$240,000 for the eradication of the pink bollworm of cotton, are simply insurance funds and will be used only in case of necessity. The committee will be interested to know that, according to the best estimates I can secure—

Mr. JONES. Are these items increases over the last?

Mr. HARRISON. The last items to which I referred are not increases, except the appropriation for fighting and preventing of forest fires, which involves an increase of \$850,000.

Mr. JONES. Over your request for that same purpose last time?

Mr. HARRISON. Yes, sir. The committee will be interested to know that, according to the best estimates I can secure, the receipts from the various activities of the department, including timber sales, grazing privileges, water-power permits, and the like, will amount, during the fiscal year 1921, to approximately \$6,925,000, compared with \$6,885,000 during the current year.

The amount recommended by the bureaus totaled \$41,953,483, an increase of \$8,053,722 over the appropriation for 1920. After giving careful consideration to each and every item, and bearing in mind the financial situation of the Nation, the Secretary, as you will note, made reductions in the bureaus' estimates aggregating \$4,425,381. He is firmly convinced that the increases approved by him are reasonable, and that they are necessary for the effective prosecution of the work of the department during the next fiscal year.

I have prepared the usual statement summarizing the estimates, which, with your approval, I shall be glad to insert in the record.

The CHAIRMAN. Does that give the estimates in detail of the bureaus?

Mr. HARRISON. It gives the increases by the individual items. We inserted a similar statement last year, as well as in preceding years.

I might refer briefly to a few of the larger items. The Secretary is renewing the recommendation, which he made at the last session of Congress, that the name of the Office of Farm Management be changed to "Bureau of Farm Management and Farm Economics," that it be placed on the same basis as other bureaus in the department, and that an appropriation of approximately \$612,000 which represents an increase of about \$300,000 over last year, be provided for the conduct, on an adequate scale, of the enlarged program for studies in the field of farm management and farm economics, including the cost of producing agricultural products, as outlined by the reorganization committee.

A plan for the improvement and extension of the crop and live stock reporting service in the Bureau of Crop Estimates, calling for an increase of \$550,000, has been developed and is incorporated in these estimates.

We are asking for additional funds for administering and protecting the national forests, for investigating important forest problems—

Mr. McLAUGHLIN of Michigan. Before you leave the other matter: Has the plan been set out and the arguments in favor of it in the print?

Mr. HARRISON. It is set out in full in the estimates under the Bureau of Crop Estimates. As I was about to say, we are asking also for additional funds for protecting and administering the national

forests, for investigating important forest problems, and for aiding private owners in bringing about the practice of good forestry on their holdings—

Mr. JONES. Is that Mr. Graves's subject?

Mr. HARRISON. Yes, sir; we are also asking for additional funds for the market news and food products inspection services in the Bureau of Markets. In order to secure greater coordination in the publication and informational work of the department, we are proposing to transfer the office of information and the office of exhibits to the division of publications, consolidating all these services under the supervision of the chief of that bureau.

We are suggesting increases for the development of other important lines of work in the various bureaus. I think I ought to call the attention of the committee to the fact that, during the war, practically no provision was made for the extension of research activities other than those which had a direct bearing on war problems. Many of the increases which we have included in the estimates, therefore, contemplate merely the prosecution of work which should have been, and probably would have been, undertaken some time ago but for the unusual conditions growing out of the war. Other increases are made necessary by reason of the large advances which have occurred in the cost of labor, materials, supplies, transportation, and the like, and do not contemplate any increase in the work.

In view of the fact that a joint congressional commission is actively engaged upon the task of reclassifying the salaries of Government employees in the city of Washington and expects to make its report to Congress in the near future, it was decided to make no provision in these estimates for increases or readjustments in compensation. We have included some new places, however, and the usual transfers have been made from the lump funds to the statutory rolls. I may add that one of the most pressing problems we have before us now is that of securing and retaining an adequate, efficient, and contented personnel, but we are hopeful that some relief will come through the action of the joint commission. If it does not, we are certainly facing a further decided lowering of efficiency throughout the service.

If the committee has no objection, I would like to insert in the record a letter which the Secretary recently wrote to the Joint Commission on Reclassification of Salaries with reference, particularly, to the salaries of the chiefs of the bureaus in the department, emphasizing the fact that the present compensation is entirely out of proportion with the responsibilities involved. I think it would be interesting to the committee to have the Secretary's views about this matter.

The CHAIRMAN. Without objection, it is so ordered.

(The letter referred to follows):

OCTOBER 13, 1919.

HON. ANDRIEUS A. JONES,

Chairman Joint Commission on Reclassification of Salaries.

DEAR SENATOR JONES: In connection with the reclassification of salaries of Government employees, there is a matter which I imagine your commission has in mind but with reference to which I am taking the liberty of expressing my views. I refer to the status and compensation of such responsible officers of the department as the chiefs of the various bureaus. I shall not undertake to express any opinion at this time regarding the status and compensation of the rank and file of the employees of the Government.

I have been impressed for some time with the fact that democracy, if it is to succeed, must be willing to secure and retain in positions of marked governmental responsibility men of the highest ability, qualification, and experience. Many positions in the Government service involving the supervision of vast enterprises now have attached to them inadequate salaries. The Government is constantly losing men of the sort I have in mind and is compelled to satisfy itself with replacements of men who, in the judgment of executive officers, may not be thoroughly qualified for the tasks assigned to them. In this department I think the compensation attached to the position of chief of bureau should be increased. The minimum should not be lower than \$5,000 per annum and the maximum might well be placed at \$7,500, and should certainly not be less than \$6,500. At present the salaries of chiefs of bureaus, with one exception, range from \$3,500 to \$5,000 per annum. The latter figure is less than that now paid by many educational institutions to professors doing no administrative work or to deans of departments, including deans of departments in the agricultural colleges.

You realize, I am sure, what tremendous tasks such bureaus as those of Plant Industry, Animal Industry, Markets, Farm Management, Chemistry, Weather, Public Roads, the Forest Service, the Solicitor's Office, and others have in hand. When we consider the scope of their work and the responsibilities attaching to the position of chief, the present compensation seems singularly small. I shall simply give a few illustrations of the magnitude of the tasks involved. Take, for instance, the Forest Service. The chief of that service has under his jurisdiction all the national forests, embracing about 155,000,000 acres of land. The forests have in them one-fifth of the standing timber and involve timber sale operations on a great scale. They support approximately 11,000,000 animals grazing under special permit, giving rise to many important and difficult problems and touching the interests of many thousands of stockmen. Furthermore, the forests contain about 30 per cent of the water power of the Nation and 42 per cent of the water power of the West, and there is invested in water-power projects in or in connection with the forests something over \$300,000,000. There are also vast responsibilities involved in the various special uses that are made of the forests, as well as in fire protection and reforestation. All told, the Chief of the Forest Service has under his direction approximately 3,000 employees.

Similar facts obtain with reference to each of the other bureaus. The Bureau of Animal Industry, for example, is charged with the administration of many important laws, such as the meat-inspection act, the 28-hour act, and the animal quarantine acts, the direction of the forces engaged in eradicating such important animal diseases as hog cholera, Texas fever (cattle tick), scabies, tuberculosis, and the like, the promotion of better live-stock methods, and the betterment of the live-stock industry of the Nation as a whole. There are approximately 5,000 employees in this bureau.

The solicitor has many responsibilities. He now has under his direction about 45 lawyers and is the principal legal officer of the department in respect to the administration of about 35 important laws, including the Federal aid road act, the grain and cotton standards acts, the warehouse act, the food and drugs act, the meat-inspection act, the animal quarantine laws, the Weeks forestry act, and the laws relating to the national forests. He also advises administrative officers regarding all the rules and regulations of the department, prepares, for submission to the Department of Justice, cases arising under the various statutes intrusted to the department for administration, and cooperates with the United States attorneys in their prosecution.

I am also strongly of the opinion that the present limitation of \$4,500 on the compensation that may be paid to scientific and technical employees should be increased. We are called upon to secure the services of some of the most highly trained experts in the Nation, many of whom are sought by industrial enterprises, and it has become increasingly difficult to secure and retain men with the requisite qualifications whose services are necessary in order efficiently to do the Government's business. While I realize that the Government can not compete with industry in the matter of salaries, still I think that further leeway should be permitted.

I sincerely trust that this matter may receive the most earnest consideration of the commission. I recognize that the chiefs of bureaus in other departments are involved, but, as a matter of fact, some of them now receive larger compensation than similar officers in this department.

Very truly, yours,

D. F. HOUSTON, *Secretary*.

Mr. HARRISON. I have merely attempted to give the committee a general idea of the estimates and of what they contain. Of course, the chiefs of the bureaus and other officers of the department will appear before you and give the details. Prof. Marvin, Chief of the

Weather Bureau, is here, and, with your permission, will present the estimates of the Weather Bureau which appear on page 25. We will defer until later the estimates of the Office of Secretary and the Office of Farm Management.

I may add, in accordance with the suggestion of the chairman, that I have suggested to the chiefs of the bureaus and others of the department that they prepare brief statements setting forth just what they wish to say about the various items in the estimates, and I believe most of them have done so. We are hoping that they will be given the opportunity to make a connected statement about each item. That, also, is in accordance with the suggestion of the chairman.

Mr. RUBEY. Have the various departments made their annual reports?

Mr. HARRISON. Yes, sir. We have 25 complete sets here this morning, and also 25 copies of the Secretary's annual report. They are available here and can be secured by the members of the committee.

I would also like to insert in the record a brief summary of the estimates which I have had prepared.

(The statement referred to follows:)

Estimates, 1921, United States Department of Agriculture.

Appropriations.	Increase.	
	Apparent.	Actual.
Statutory salaries (not including \$1,673,540 transferred to new lump-fund item for salaries of forest supervisors, deputy supervisors, rangers, and guards).....	\$536,960	\$86,180
Lump-fund appropriations.....	3,091,381	3,542,161
Total.....	1 3,628,341	1 3,628,341

Appropriation, 1920.....	\$33,899,761
Estimates, 1921, as submitted by bureaus.....	41,953,483
Increase, 1921, as submitted by bureaus.....	8,053,722
Estimates, 1921, as approved by the Secretary.....	37,528,102
Increase, 1921, as approved by the Secretary.....	1 3,628,341

¹ As \$41,509 of the increase for rent in the District of Columbia is transferred from the sundry civil act, and the increase of \$79,720 for the enforcement of the cotton-futures act merely replaces, in part, certain funds available during the current fiscal year under the wheat price guaranty act, the net increase is \$3,507,112. Furthermore, the item of \$1,000,000 for fighting and preventing forest fires (an increase of \$850,000 over the present appropriation), the item of \$1,000,000 for combating the foot-and-mouth disease, and the item of \$240,000 for the eradication of the pink boll worm of cotton are merely insurance funds and will be used only in case of necessity.

It is estimated that the receipts from the various activities of the department, including timber sales, grazing privileges, water-power permits, and the like, will amount during the fiscal year 1921 to approximately \$6,925,000, compared with \$6,885,000 during the current fiscal year.

AGRICULTURE APPROPRIATION BILL.

Statement giving comparison between department estimates and bureau estimates for 1921 and appropriation act for 1920.

Bureau or office.	Appropriation in agricultural act, 1920.	Bureau or office estimates, 1921.	Increase (+) over or decrease (-) below agricultural act, 1920.	Department estimates, 1921. (19) Agricultural exhibits.....			100,000	100,000
Total.....	4,927,761	5,126,091	1,836,380	1,583,930
Net.....	3,091,381	3,542,161		

¹ Inasmuch as \$100,000 is made available from appropriations under the wheat-price guaranty act for expenditure during the fiscal year 1920 in carrying out the provisions of amendments to the cotton-futures act, and as only \$6,100 has been transferred to the statutory roll of the Bureau of Markets for the fiscal year 1921, this represents an actual decrease of \$20,280.

² Includes \$150,000 now provided in the item for fighting and preventing forest fires, under general expenses of the Forest Service.

³ \$50,000 transferred from this item to the Division of Publications.

CHANGES IN PHRASEOLOGY.

BUREAU OF FARM MANAGEMENT AND FARM ECONOMICS.

Name of bureau.—The name of the Office of Farm Management has been changed to Bureau of Farm Management and Farm Economics.

(31) *Farm management investigations.*—New language has been substituted for the present lump-fund item for farm-management investigations, as follows: "To investigate the cost of production of farm products; to study economic problems connected with farm financial relations, farm labor, land utilization, ownership and tenancy, and rural-life conditions; to compile and publish the Atlas of American Agriculture; and to encourage improved farm-organization and farm-management methods."

WEATHER BUREAU.

(57) *Establishment and maintenance of aerological stations.*—After the word "phenomena" has been inserted "and the issuing of weather forecasts, advices, and warnings," after "in aid of," the words "military, naval, and civil"; after "aeronautics," the words "and in the development of navigation of the air"; and before "other" the word "all."

(60) *Sale of Mount Weather.*—A new paragraph has been added authorizing the sale of Mount Weather, including land, together with buildings and other improvements, the net proceeds of the sale, after deducting the expenses incidental thereto, to be turned into the Treasury as miscellaneous receipts.

BUREAU OF ANIMAL INDUSTRY.

(61) *Tuberculosis investigation and eradication.*—After the amount the words “of which \$500,000 shall be set aside for administrative and operating expenses and \$1,000,000 for the payment of indemnities” have been omitted; also the words “within the limitations above provided” in the first proviso.

(69) *Meat inspection.*—The words “including the purchase of tags, labels, stamps, and certificates printed in course of manufacture” have been inserted before the amount; and the balance of the paragraph, relative to the inspection of equine meat has been eliminated. The provision authorizing payment for overtime work at meat-inspection establishments has also been omitted.

BUREAU OF PLANT INDUSTRY.

(93) *Cereal investigations.*—The words “leaf rust” have been inserted after the words “black rust.”

(99) *Dry land agriculture investigations.*—After the amount the following proviso has been added: “Provided, That the limitations in this act as to the cost of farm buildings shall not apply to this paragraph.”

(107) *Foreign seed and plant introduction.*—The following language, after the amount, has been omitted: “Of which sum the Secretary of Agriculture is authorized to expend \$50,000, or so much thereof as may be necessary, for the purchase of not to exceed fifty acres of suitable land near the city of Washington, District of Columbia, and the erection thereon of all necessary buildings and equipment, and for the establishment of a plant-inspection and detention station: *Provided*, That not to exceed \$10,000 of this sum shall be expended for the purchase of the land.” In place of the language eliminated the following new proviso has been inserted: “*Provided*, That the Secretary of Agriculture is hereafter authorized to acquire by gift, devise, or by purchase for a sum not to exceed \$1 for each site, the sites now occupied by field stations at Chico, California, consisting of about eighty acres and used for propagating, testing, and distributing new plant introductions; the site at Bellingham, Washington, consisting of about sixty acres and used as a bulb station and for propagating, testing, and distributing new crop plants, and the sites at Buena Vista, Florida, and Savannah, Georgia, consisting of about twenty-five acres, and about forty-six acres, respectively, and used for propagating, testing, and distributing new crop plants peculiarly adapted to the warmer parts of the United States.”

(108) *Purchase and distribution of new and rare seeds, and forage crop investigations.*—This paragraph has been split into two items, the forage crop work being segregated from the new and rare seed item without change in phraseology.

FOREST SERVICE.

(80) *Introductory paragraph, general expenses.*—The proviso relative to the erection of buildings on the national forests has been amended so as to raise the limitation on the cost of buildings from \$800 to \$1,500, and the words “or improved” have been inserted after the word “erected.”

(81) *Employment of forest supervisors, rangers, and guards.*—A new lump-fund item has been inserted providing for the salaries of forest supervisors, deputy supervisors, rangers, and guards, heretofore carried on the statutory roll, without increase in the total appropriation.

(82) *Use, maintenance, improvement, and protection of national forests.*—The words “of other employees” have been inserted after “salaries.”

(111) *Cœur d'Alene National Forest.*—The following proviso has been added after the amount: “*Provided*, That the Secretary of Agriculture is authorized to use, not to exceed \$500 of the funds herein appropriated for the Cœur d'Alene National Forest, for the marking of the graves in Wallace, Idaho, of thirteen men who lost their lives while fighting forest fires in the employ of the Forest Service on the Cœur d'Alene National Forest on August 10, 1910, including concrete curbing for the graves, and seeding, planting, and improving the plat.”

(118) *Custer National Forest.*—Before the amount the words “and South Dakota” have been added.

(159) *Minam National Forest.*—This item has been omitted, as it is proposed to consolidate this forest with the Whitman National Forest.

(165) *Monterey National Forest.*—This item has been omitted, as the Monterey National Forest has been consolidated with the Santa Barbara National Forest.

(198) *Sioux National Forest.*—It is proposed to consolidate this forest with the Custer National Forest. The item has therefore been omitted.

(240) *Land classification and entry surveys.*—After the words “authorized by law” the following new language has been added: “And for the survey thereof by metes and bounds or otherwise by employees of the Forest Service under the direction of the Commissioner of the General Land Office.”

(241) *Fighting and preventing forest fires.*—This item has been omitted and provision made for the work under the “Miscellaneous” section of the bill.

(246) *National forest planting.*—The proviso authorizing the purchase of land used as a forest nursery site for the Michigan National Forest has been omitted.

(250) *Improvement of the national forests.*—After the first proviso the following language has been inserted: “Provided further, That the Secretary of Agriculture is authorized to use not to exceed \$5,000 of the funds herein appropriated for the purchase of lands needed for ranger stations.” In the next proviso the word “hereafter” has been inserted after “that”; the words “any funds appropriated for the Forest Service” substituted for “the money herein appropriated”; the words “in and” and “this appropriation” eliminated, and the word “law” added. In the third proviso the word “hereafter” has been inserted to follow “that”; the words “this appropriation” eliminated; and the words “any funds appropriated for the Forest Service” substituted for “this appropriation.”

BUREAU OF ENTOMOLOGY.

(35) *Southern field crop insect investigations.*—After the amount have been added the words “of which sum \$25,000 shall be immediately available.”

BUREAU OF BIOLOGICAL SURVEY.

(30) *Sullys Hill National Park game preserve.*—This paragraph has been amended by inserting the words “and maintenance” after “improvement” and changing the word “preserves” to “preserve.”

DIVISION OF PUBLICATIONS.

(77) *Introductory paragraph, general expenses.*—Before the words “as follows,” at the end of the paragraph, the words “and information and exhibit work” have been inserted.

(81) *Photographic equipment and materials.*—In the first proviso, after “that,” the word “hereafter” has been inserted.

(85) *Agricultural exhibits.*—This paragraph has been amended by eliminating the clause relating to the National Dairy Show, and the clause limiting the amount that may be expended for any one fair to \$5,000, and by adding at the end of the item the words “including rent and employment of persons and means in the District of Columbia and elsewhere.”

(87) *Details to and from the Division of Publications.*—The following new paragraph has been inserted: “Hereafter employees of the Division of Publications may be detailed by the Secretary of Agriculture for publication, information, and related work in any of the bureaus or offices of the department, for duty in or out of the District of Columbia, and employees of the bureaus and offices may also be detailed to the Division of Publications for duty in or out of the District of Columbia, traveling expenses of employees so detailed, when necessary, to be paid from the appropriation of the bureau or office in connection with which such travel is performed.”

BUREAU OF CROP ESTIMATES.

(17-20) *Administrative expenses and field investigations.*—The two items “Administrative expenses” and “Field investigations” have been consolidated and the phraseology of the item amended to read as follows: “For all necessary expenses, including salaries and the employment of labor in the city of Washington and elsewhere, freight and express charges, official traveling expenses, office fixtures, supplies, calculating machines, and other equipment for collecting, compiling, abstracting, analyzing, summarizing, interpreting, and publishing data relating to agriculture, including field printing of special forms or schedules, and State crop reports; for making crop and live-stock estimates, including acreage, yield, number, and value, losses by diseases, insect pests, and adverse weather conditions, requirements, and consumption of seeds, fertilizers, insecticides, and fungicides, and marketable surpluses on farms, by counties, recognized producing districts, and States, independently or in cooperation with other Federal and State departments and agencies.”

MISCELLANEOUS EXPENSES.

Miscellaneous expenses, Department of Agriculture.—The following clause at the end of the item has been omitted: "Of which \$33,000 shall be for necessary repairs to the central heating plant of the department."

STATES RELATIONS SERVICE.

(41) *Insular experiment stations.*—The immediately available clauses in the Alaska and Guam subitems have been omitted, as has also the proviso granting leave of absence privileges to employees assigned to permanent duty in the Virgin Islands and allowing accumulative leave to employees of the insular experiment stations.

BUREAU OF PUBLIC ROADS.

(55) *Road material investigations.*—At the end of the paragraph new language has been added as follows: "For conducting laboratory and field experiments, and for studies and investigations in road design, independently or in cooperation with State highway departments and other agencies."

(59) *Rural engineering investigations.*—A clause has been inserted at the end of this paragraph making \$50,000 immediately available.

BUREAU OF MARKETS.

(95) *Enforcement of the cotton futures act.*—After "cotton futures act" the words "as amended March 4, 1919" have been inserted.

(96) *Enforcement of the grain standards act.*—The following proviso has been added at the end of the paragraph: "Provided, That section 6 of the said act is hereby amended, effective on and after the passage of this act, by striking out of the first sentence the words 'sold, offered for sale, or consigned for sale, or which has been shipped, or delivered for shipment in interstate or foreign commerce shall have been inspected,' and substituting therefor the words 'shall have been inspected by an inspector licensed under the act,' and by striking out of the last sentence the words 'made after the parties in interest have had opportunity to be heard.'"

(98) *Administration of the warehouse act.*—The paragraph amending sections 6 and 18 of the warehouse act has been omitted.

(99) *Authority to administer oaths, examine witnesses, etc.*—The paragraph empowering the Secretary of Agriculture to administer oaths, examine witnesses, and call for the production of books and papers, in connection with the performance of the duties required of the Bureau of Markets in the administration or enforcement of the provisions of the acts relating to the Department of Agriculture, has been eliminated.

FEDERAL HORTICULTURAL BOARD.

(22) *Plant quarantine in the District of Columbia.*—A new paragraph has been inserted, amending the plant quarantine act of August 20, 1912, so as to authorize the Secretary of Agriculture to regulate the movement of plants and plant products, including nursery stock, from and into the District of Columbia, and to control injurious plant diseases and insect pests within the District of Columbia.

MISCELLANEOUS.

(8) *Eradication of foot-and-mouth disease and other contagious diseases of animals.*—"Fiscal year 1919" has been changed to "fiscal year 1920" and "1920" to "1921."

(10) *Loan or exchange of American bison.*—This paragraph has been omitted.

(11) *Mileage rates for motor vehicles.*—The year "1920" has been changed to "1921."

(14) *Actual traveling expenses.*—The following new paragraph has been inserted: "Officers and employees of the Department of Agriculture during the fiscal year ending June 30, 1921, while traveling on official business away from their designated posts of duty may be allowed not to exceed \$7 per day for subsistence, but in no case shall they be reimbursed any sum in excess of expenses actually incurred by them."

(15) *Per diem traveling expenses.*—The following new paragraph has been inserted: "The Secretary of Agriculture, during the fiscal year ending June 30, 1921, is authorized to prescribe per diem rates of allowance not exceeding \$6 in lieu of subsistence to officers or employees of the Department of Agriculture engaged in field work or traveling on official business outside of the District of Columbia away from their designated posts of duty."

(16) *Leave of absence for field employees.*—The following new paragraph has been inserted: "The employees of the Department of Agriculture, outside of the District of Columbia, may hereafter, in the discretion of the Secretary of Agriculture, be granted leave of absence not to exceed thirty days in any one year, which leave may, in exceptional and meritorious cases, where such employee is ill, be extended in the discretion of the Secretary of Agriculture not to exceed thirty days additional in any one year."

(17) *Accumulative leave of absence for employees in Alaska, Hawaii, Porto Rico, Guam, and the Virgin Islands.*—The following new paragraph has been inserted: "Hereafter if any employee of the Department of Agriculture assigned to permanent duty in Alaska, Hawaii, Porto Rico, Guam, and the Virgin Islands shall elect to postpone taking any or all of the annual leave to which he may be entitled, he may, in the discretion of the Secretary of Agriculture, subject to the interests of the public service, be allowed to take at one time in any calendar year unused annual leave which may have accumulated within not to exceed four calendar years immediately preceding and be paid at the rates prevailing during the year such leave has accumulated."

(18) *Cooperation.*—This paragraph, restricting the use of funds contributed by agencies outside of the Federal Government for use in cooperative work, has been omitted.

(22) *Wrapped meats.*—This paragraph, making the word "package," where it occurs in the act amending section 8 of the food and drugs act, applicable to wrapped meats, has been omitted.

(23) *Leave of homesteaders.*—This paragraph, excusing homesteaders from residence on their lands because of serious drought conditions, so as to enable them to seek employment elsewhere in order to obtain the necessaries of life, has been omitted.

(24) *Protection of employees of the Forest Service and the Bureau of Biological Survey engaged in the enforcement of law.*—The following new paragraph has been inserted: "That section 62 of the act of March 4, 1909 (35 Stat. L., 100), entitled 'An act to codify, revise, and amend the penal laws of the United States,' is hereby amended by inserting after the name 'Bureau of Animal Industry' where it occurs in that section the following: 'of the Forest Service, or of the Bureau of Biological Survey,' so that the section will hereafter read as follows:

"SEC. 62. Whoever shall forcibly assault, resist, oppose, prevent, impede, or interfere with any officer or employee of the Bureau of Animal Industry, of the Forest Service, or of the Bureau of Biological Survey, of the Department of Agriculture, in the execution of his duties, or on account of the execution of his duties, shall be fined not more than \$1,000, or imprisoned not more than one year, or both; and whoever shall use any deadly or dangerous weapon in resisting any officer or employee of the Bureau of Animal Industry, of the Forest Service, or of the Bureau of Biological Survey, of the Department of Agriculture, in the execution of his duties, with intent to commit a bodily injury upon him or to deter or prevent him from discharging his duties, or on account of the performance of his duties, shall be fined not more than \$1,000, or imprisoned not more than five years, or both."

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVE,
Friday, December 19, 1919.

AFTER RECESS.

The committee met, pursuant to the taking of a recess, at 2 o'clock p. m., Hon. Gilbert N. Haugen (chairman) presiding.
Present: Members of the committee.

OFFICE OF THE SECRETARY.

The CHAIRMAN. The committee will come to order. We will proceed with the hearings. We will next consider the estimates for the office of the Secretary, page 9.

Mr. HARRISON. Mr. Reese, chief clerk of the department, is here, Mr. Chairman, and will explain those items.

STATEMENT OF MR. R. M. REESE, CHIEF CLERK, DEPARTMENT
OF AGRICULTURE.

The CHAIRMAN. Do you desire to make a general statement or do you desire to take up the estimates item by item?

Mr. REESE. I will be very brief, Mr. Chairman. The statutory roll of the office of the Secretary provides for no increases at all. The items in brackets—items 11, 13, and so on—indicate transfers to the statutory roll of the Division of Publications, in accordance with a plan to consolidate all of the publication, informational, and exhibit activities of the department.

Mr. HARRISON. This is a part of a plan to consolidate all the publication work into one division.

The CHAIRMAN. Under one head?

Mr. HARRISON. Yes, sir.

The CHAIRMAN. You propose to take it from under the office of the Secretary?

Mr. HARRISON. Yes; we propose to take the publication units now in the office of the Secretary and place them under the Division of Publications.

The CHAIRMAN. It is changing back?

Mr. HARRISON. No. The office of information and the office of exhibits, which heretofore have been directly under the Secretary's office, will be transferred to the Division of Publications. The work is now supervised by the chief of that division, and the purpose of

these changes is to effect the necessary adjustments in the appropriation bill.

The CHAIRMAN. As I understand it, you are putting the publication work all under one head?

Mr. HARRISON. Yes, sir.

The CHAIRMAN. And taking it from under the Secretary's office?

Mr. HARRISON. Of course, the work of the Division of Publications will continue to be done under the direction of the Secretary.

Mr. REESE. The other changes noted are unimportant. Item No. 34 is a change in the designation of one clerk in lieu of one auditor at the same salary; that is proposed simply to give greater flexibility in filling the place in case there should be a vacancy.

The CHAIRMAN. In order to give flexibility in filling the place. Is this in the Division of Publications?

Mr. REESE. No.

The CHAIRMAN. Item No. 13 is a transfer of one assistant at \$2,000 to the statutory roll of the Division of Publications?

Mr. REESE. Yes, sir.

The CHAIRMAN. And No. 11?

Mr. McLAUGHLIN of Michigan. No. 11 is one assistant in charge of information, \$3,000, to be transferred to the statutory roll, Division of Publications. Was that the salary paid in the other division?

Mr. REESE. Yes, sir.

Mr. McLAUGHLIN of Michigan. Was he on a statutory roll in the other division?

Mr. REESE. As you will see, he is now on the statutory roll of the office of the Secretary. We are proposing his transfer from that roll to the statutory roll of the Division of Publications.

Mr. McLAUGHLIN of Michigan. It is transferring him from one statutory roll to another?

Mr. REESE. Yes. All these cases are transferred from one statutory roll to another at the same salary.

The CHAIRMAN. My understanding is that a year or so ago these places were transferred from the Division of Publications to the Secretary's office. Are you now transferring them back?

Mr. HARRISON. Two or three years ago several editors on the rolls of the Division of Publications who were engaged in reading manuscript under the direction of the assistant in charge of manuscripts in the Secretary's office, and who had been doing that work for some time, were transferred in the bill to the latter office. Since that time we have worked out a plan for the consolidation of all the informational, exhibit, and motion-picture activities in the Division of Publications, and now we wish to transfer to that division these editors, together with all other employees in the Secretary's office engaged on informational, exhibit, or motion-picture work.

The CHAIRMAN. On what basis is the recommendation made?

Mr. HARRISON. The general plan, as I have said, is to bring together all our publication activities under the supervision of the Chief of the Division of Publications in order to promote efficiency and facilitate the handling of the work. The informational work is merely one phase of our publication activities. The same is true with regard to exhibits and motion pictures.

The CHAIRMAN. That was true in the past just as well as it is now; why are you making the changes now?

Mr. HARRISON. It is a better administrative arrangement, and is a great improvement over the present plan.

The CHAIRMAN. After trying the other?

Mr. HARRISON. We are convinced that the arrangement we are proposing is the best. As I say, the Chief of the Division of Publications, by administrative order, has been charged with the supervision of all the publication work, even though a part of it is in the Secretary's office; and the purpose of the changes suggested here is merely to effect the necessary adjustments in the appropriation bill.

The CHAIRMAN. What I wish to have explained is why you are switching them back and forth.

Mr. HARRISON. I explained a few moments ago that a few editors were transferred to the Secretary's office because they were detailed to and actually working in the Secretary's office, under the immediate direction of the assistant in charge of manuscripts in the Secretary's office. This assistant has since been made Chief of the Division of Publications, and we are now bringing all the publication work together under his supervision. The changes proposed here, including the transfer of the editors, are necessary in order to effect the consolidation. The places to be transferred to the Division of Publications are listed on page 14, and the Secretary's roll has been correspondingly reduced in each case. They are also shown within the heavy parentheses as you go through the statutory roll.

The CHAIRMAN. The trouble in that is that that will not appear in the record. My idea is to have it all in the record. Why do you change one auditor to a clerk?

Mr. REESE. That is to give greater flexibility in filling the place when it happens to become vacant. As a matter of fact, the auditor actually does some clerical work.

The CHAIRMAN. You have auditors in every division?

Mr. REESE. We have an auditor in each division. That is required by law. That is required by the Dockery Act of 1912.

The CHAIRMAN. The auditor does the auditing work?

Mr. HARRISON. The auditing work is done in the different branches of the department.

The CHAIRMAN. What is done under the Division of Accounts?

Mr. HARRISON. The Division of Accounts is the disbursing office of the department.

The CHAIRMAN. It has nothing to do with the auditing?

Mr. HARRISON. It does no auditing. However, it examines the accounts submitted to it for payment in order to determine whether they represent a legal charge against the appropriation and whether the extensions and totals are correct.

The CHAIRMAN. That is, it determines the legality?

Mr. HARRISON. The Division of Accounts, before it will pay an account, must necessarily determine whether or not, in its opinion, the account comes within the scope of the appropriation. The function of the auditor is to ascertain whether it complies with the administrative and fiscal regulations of the department and the accounting rules of the Treasury. The Dockery Act of 1912 requires that the administrative examination of accounts shall be made by the various bureaus. Formerly we had a centralized accounting system, but this was changed after the passage of that act.

The CHAIRMAN. How about the checking in the bureau?

Mr. HARRISON. I do not quite understand what you have in mind.

The CHAIRMAN. Does anybody check up the bureaus and pass on the expenditures and salaries?

Mr. HARRISON. The matter of salaries is an entirely different matter. Before any appointment can be made in the department the chief of the bureau must make an appropriate recommendation to the Secretary's office and the recommendation must be considered and approved by the Secretary before the man is placed on the rolls of the department.

The CHAIRMAN. How about the other expenditures?

Mr. HARRISON. The other expenditures are examined by the auditors in the various bureaus.

The CHAIRMAN. Is there one for every bureau?

Mr. HARRISON. There is one for each bureau, and he has such assistants as may be necessary to handle the accounts of that bureau.

The CHAIRMAN. But what does he determine?

Mr. HARRISON. The financial clerk of each bureau checks the expenditures of his bureau and determines whether they are administratively correct, whether they are in accordance with the comptroller's decisions and the fiscal regulations of the department and whether they comply with the instructions of the chief of the bureau. Then the chief of the bureau examines the accounts to ascertain whether they are reasonable and proper, and if he approves them they are forwarded to the Division of Accounts and Disbursements for payment. After payment has been made, and sometimes before, the accounts are transmitted to the Auditor for the State and Other Departments for examination.

The CHAIRMAN. Who is held responsible?

Mr. HARRISON. The disbursing clerk of the department and the chief of the bureau.

The CHAIRMAN. Who is responsible as to whether or not the expenditures are correctly made?

Mr. HARRISON. The chief of the bureau, in the first instance. The Chief of the Division of Accounts, of course, is the bonded disbursing officer of the department, and he is liable under his bond for any illegal expenditures. The secretary's office also, through its office of inspection, inspects and examines the accounting work of the various bureaus from time to time.

The CHAIRMAN. Is there any further checking up?

Mr. HARRISON. Not in the sense that we make a complete audit of expenditures at the close of the fiscal year. The chief of the bureau is administratively responsible under the terms of the Dockery Act of 1912.

The CHAIRMAN. The responsibility is there, but who ascertains whether it is properly done or not?

Mr. McLAUGHLIN of Michigan. I suppose the chief of the bureau is the man who is charged with carrying on the work properly in his bureau, and he makes recommendations to the secretary, and estimates are made as to the amount of money that will be necessary to carry on that kind of work and the men to be employed. The auditors you speak of simply determine whether or not the money is spent in accordance with the law, and the chief of the bureau keeps

track of the kind of work that is done, sees whether it is properly done, and whether there is sufficient funds to justify the expenditures.

Mr. HARRISON. Yes, sir.

The CHAIRMAN. That kind of a system is no good, or at least I hope no one will think it is.

Mr. McLAUGHLIN of Michigan. It depends on the man at the head of the bureau, whether he can be in touch with the work that is going on and is able to say whether the money is being expended wisely or not.

The CHAIRMAN. Suppose a chief of a bureau should decide to give a man a trip around the world and pay all of his expenses, which would cost, let us say, \$10,000. There is no one to question whether or not that money is rightly expended—no one except the chief of the bureau? Is that sufficient?

Mr. HARRISON. I did not intend to create any such impression.

The CHAIRMAN. What I am trying to get at is what kind of checking up is done?

Mr. HARRISON. Mr. Chairman, we have a volume of fiscal regulations which indicate and limit the authority of the chiefs of the bureaus in connection with expenditures. The auditors, of course, must see that these regulations are complied with and that the necessary authority was given before the expenditures were incurred.

The CHAIRMAN. That is what I am trying to get at.

Mr. HARRISON. Take the special case you mention. The chief of the bureau can not authorize, nor is there anyone in the department who can authorize, a trip around the world without securing the approval, in advance, of the secretary.

The CHAIRMAN. Limitations are one thing and checking is another—two entirely different things.

Mr. HARRISON. As I said, Mr. Chairman, no one in the Department of Agriculture, except the secretary or the acting secretary, can authorize a foreign trip.

The CHAIRMAN. I am not discussing the limitations when I am talking about checking. What assurance have we that this money is being properly expended? That is what I am trying to get at.

Mr. REESE. There are letters of authorization that are sent at the beginning of the fiscal year to the chiefs of the bureaus which direct them to conduct the work of their bureaus under the law and the fiscal regulations. After that has been done, all the expenditures of the department are reported to Congress in detail.

The CHAIRMAN. That is getting away from the question again. What I want to know is whether or not there is anyone who examines these expenditures with the view of determining how the money has been expended, and whether anyone knows whether it has been properly expended or not? That is what I am trying to get at.

Mr. HARRISON. I think we have an adequate number of checks in the Department of Agriculture to prevent unwise expenditures.

Mr. McLAUGHLIN of Michigan. As I see it, clerks and auditors are assigned to determine whether or not the money has been expended in any particular case in accordance with law. That isn't a difficult matter—that sort of checking. I suppose the head of the bureau, when he has to make disbursements of money, determines whether

or not the kind of work shall be done. If they have the money, they have a trained force for that work, and he employs men to do or directs men to do it. It is left to his judgment to decide whether it is properly done, whether the results he hoped to obtain have been accomplished, and whether, in his judgment, it ought to be continued, and if there is any change in plans he directs the change, and so on.

The CHAIRMAN. What I have reference to, to be perfectly candid, is this: If he wants to send a man out in a certain State on the pay roll to do political work, drawing a salary from the Public Treasury, who passes upon whether that is a proper expenditure of the money?

Mr. HARRISON. I may say that a chief of bureau can not begin a new project or a new line of work without the prior approval of the Secretary. He can not authorize purchases in excess of \$100 except in the case of the Forest Service and the Weather Bureau, where the limitation is \$500, without securing the Secretary's approval in advance. He can not make appointments without first obtaining the Secretary's consent, except under certain unusual conditions in the field, and even then all the facts must be presented to the Secretary for consideration. We require the fullest sort of information in each case, including the previous history, training, and experience of the person concerned, and determine, on the statement of the chief of the bureau, whether the person's services are necessary and whether the salary recommended is reasonable in all the circumstances.

No travel can be performed, except in certain limited areas, without the prior approval of the Secretary. Every day travel letters of authorization come in for the consideration of the Secretary, and he determines whether the travel is justified, whether the expenditure involved is warranted, etc., before he gives his approval. No one can attend meetings, except local gatherings in the field in line with work of the department, without submitting the matter to the Secretary. No foreign travel can be made without the previous approval of the Secretary. There are numerous other checks on expenditures prescribed by the administrative, property, and fiscal regulations of the department. The limitations in these regulations prevent chiefs of bureaus and other officers of the department from incurring any expenditures of consequence without securing the advance approval of the Secretary. They operate as very effective checks and the checks are made before it is too late, before the obligation has been incurred.

The CHAIRMAN. Too late? You could put a man in jail for that sort of a crime. That would be the remedy—to put him in jail.

Mr. HARRISON. That would be true in the case of illegal expenditures—

The CHAIRMAN (interposing). I am not criticizing any thing in the department. I merely want to find out about the checking.

Mr. LESHER. What system of checking is used?

Mr. HARRISON (continuing). A man can be put in jail, of course, where he acts illegally; but an unwise expenditure is a different thing. Perhaps I ought to say in this connection that the Secretary's office, in addition to the limitations and checks to which I have referred, is constantly calling for statements from the bureaus about expenditures of various sorts. These statements are examined carefully, and if it seems desirable, additional instructions regarding them are issued. We have a committee on finance and business methods, whose

duty, as its name implies, is to consider various financial and business problems arising throughout the department and to make appropriate recommendations to the Secretary for consideration and action.

As I have explained, Mr. Leshner, we have an auditor in each bureau, a financial clerk, who is charged with the duty of checking expenditures to see whether or not they are in accordance with the law, the fiscal regulations, and the comptroller's decisions. The chief of each bureau is administratively responsible for the expenditures in his bureau, but no expenditures of any consequence can be made without the prior approval of the Secretary, as I have already indicated. In this way there is a constant check on the propriety, as well as on the legality, of expenditures in the Department of Agriculture.

Going back to the question of auditing, the accounts, after being examined by the financial clerk and having received the administrative approval of the chief of the bureau, are transmitted to the Division of Accounts, where they are again examined to see whether the extensions and additions are correct and whether they are legal, because the chief of that division is the bonded disbursing officer of the department, and, if he makes an erroneous payment, he is responsible under his bond. The accounts go from the disbursing officer to the Auditor for State and Other Departments, where another examination is made and, in some cases, they may go to the comptroller. If the auditor disagrees with any payment made by the disbursing officer, he will make disallowances in his account, and, unless the disbursing officer can secure reimbursement from the person in the bureau who was responsible for the expenditure, the disbursing officer must make good the amount involved.

I shall be glad to submit to the committee for its information a copy of our fiscal regulations in order that it may see just how expenditures in the department are checked.

The CHAIRMAN. That is what I have been trying to get at, Mr. Harrison.

Mr. HARRISON. I am sorry that I did not understand at the beginning of the discussion just what you had in mind. I thought you were of the opinion that we ought to have a force of employees assigned especially to the task of checking up the wisdom of expenditures, say, at the close of each fiscal year.

The CHAIRMAN. The expenditures should be checked in some way. Any business concern would require that. It possibly is not being in all the departments of the Government, which may account for the extravagance and waste of expenditures.

Mr. HARRISON. Mr. Chairman, I would like to—

The CHAIRMAN (interposing). I am not referring to your department particularly.

Mr. HARRISON. I shall be glad at any time to lay all our records before the committee. So far as I know, we have nothing to conceal. Before any charge of waste or extravagance is made, it seems to me that the facts ought to be fully ascertained. Only in this way can the committee determine whether there has, in fact, been any extravagance or waste in the Department of Agriculture.

The CHAIRMAN. I am charging the various departments of the Government with waste; I am not referring specifically to your department.

Mr. HARRISON. That includes the Department of Agriculture.

The CHAIRMAN. If you will read the speeches on the floor of the House and the evidence produced before Congress, I think you will find all of that to be correct.

Mr. HARRISON. Of course, we can not accept any responsibility for what some other department is alleged to have done. I take it that, in any event, the Department of Agriculture can not be charged with waste or extravagance unless the facts justify it.

The CHAIRMAN. I am charging waste to the Government as a whole; I do not think that can be contradicted. All this committee can do is to find out about the one department, the department we are responsible for, what it is doing.

You may proceed, Mr. Reese.

Mr. REESE. The next is item 37, on page 10:

Eighteen clerks, class 2 (decrease of four by transfer to statutory roll, Division of Publications, and one new place, making a net decrease of three).

Four clerks of class 2 are transferred from the statutory roll of the office of the Secretary to the statutory roll of the Division of Publications. All the transfers from the Secretary's office to the Division of Publications are brought together in the table at the bottom of page 14.

Mr. ANDERSON. You are centralizing the exhibits and publications and informational work in the Division of Publications?

Mr. REESE. Yes, sir; as Mr. Harrison explained at some length, the idea is to bring all the publication and informational work together, so that it will come under the direction of the Chief of the Division of Publications. These transfers involve no increases in salary whatever.

Mr. ANDERSON. On page 12, item 59, you have—

Ten firemen, at \$1,080 each (by transfers from lump funds, one from meat inspection, Bureau of Animal Industry; one from black and stripe rust, one from blister rust control, and one from administrative expenses, Bureau of Plant Industry; two from food and drugs act, Bureau of Chemistry; one from deciduous fruit insects, Bureau of Entomology; one from farmers' cooperative demonstrations in North and West, States Relations Service; one from food supply investigations, and one from cotton futures act, Bureau of Markets).

Mr. REESE. Yes, sir.

Mr. ANDERSON. I would like to have an explanation in regard to that item.

Mr. REESE. I will give the history of that case. In August, 1918, the firemen were receiving a salary of \$720. Vacancies occurred which we could not fill at that price at that time. The matter was taken up with the Government Employment Bureau, in order to secure some men to fill the places, but it was impossible to obtain firemen for \$720. In fact, it was practically impossible to secure them at any figure. Then a committee of firemen waited on the mechanical superintendent and informed him that they could not exist on a salary of \$720 and presented what was in fact an ultimatum, that they would leave the service the next day if their pay was not increased. The work of the department has to go on; its power plant has to be operated; the department can not get along without it. Rather than see the power plant closed down and its operations practically hamstrung, we advanced these firemen to a

wage of \$3.35 a day, placing them upon the lump-sum rolls for that purpose. Their compensation was later changed to \$1,080 per annum.

We now propose in the estimates to transfer these firemen from the lump-sum rolls, on which they are now carried, to the statutory roll of the office of the Secretary, at a salary of \$1,080 per annum, and to reduce the lump-sum rolls correspondingly.

Mr. RUBEX. You have been paying these men out of the lump-sum rolls?

Mr. REESE. Yes, sir.

Mr. RUBEX. And your purpose is to place them on the statutory roll as indicated here?

Mr. REESE. Yes, sir. The expense was apportioned among the various bureaus in order not to deplete too heavily the funds of any one bureau.

Mr. TINCHER. The department, then, is really placing these men, who are now on the lump-sum rolls, on the statutory roll?

Mr. REESE. Yes, sir.

Mr. HUTCHINSON. What is the reason for this?

Mr. REESE. To carry out the established policy of transferring from lump-sum rolls to statutory rolls employees whose work is permanent and continuous. As already explained, it is proposed to transfer these firemen from the various lump-sum rolls from which they are now paid to the statutory roll of the Secretary's office, and to reduce the lump-sum rolls accordingly.

Mr. McLAUGHLIN of Michigan. These men are all employed in one place?

Mr. REESE. They are employed in the central power plant of the department and in the supplementary plant at the greenhouses.

Mr. RUBEX. One is paid from one roll, and another man is paid from another roll, one is paid from meat inspection, and another from black and stripe rust, and so on, and that has been done since last August.

Mr. REESE. August, 1918.

Mr. McLAUGHLIN of Michigan. They are all doing the same sort of work?

Mr. REESE. Yes, sir.

Mr. McLAUGHLIN of Michigan. And one man is paid from the funds of one bureau, and another is paid from the funds of another bureau?

Mr. REESE. Yes, sir.

Mr. McLAUGHLIN of Michigan. How long has that practice been going on?

Mr. REESE. Details may be made to and from the office of the Secretary under the law, and they have to be made in certain cases.

Mr. McLAUGHLIN of Michigan. I asked how long the practice had prevailed of having a number of men working together, doing exactly the same kind of work, at the same place, one being paid from the funds of one bureau and another paid from the funds of another bureau in the department.

Mr. HARRISON. All these firemen are now detailed to the office of the Secretary and the purpose of these changes is to bring them all together on the statutory roll of the Secretary's office.

Mr. ANDERSON. This is a recommendation to strike out 10 firemen who are on lump-sum rolls and to add 10 firemen to the statutory rolls?

Mr. REESE. Yes.

Mr. ANDERSON. You add 10 firemen here to the statutory roll by transfer from a number of lump-sum rolls, evidently to replace firemen who were previously on the statutory roll. Then, under item No. 61, you drop four firemen at \$720 each.

Mr. REESE. That is a decrease in the number of firemen at \$720. We have added some more firemen.

Mr. ANDERSON. That is what I wanted to know about.

Mr. REESE. The task of firing, as you doubtless realize, is a 24-hour-a-day proposition for 365 days in the year. Our firemen were required to be on duty practically all the time. They only had two days off a month. They did not get Sundays and holidays like the rest of us. We thought that was unfair to these men, and we increased the number of firemen so as to give each three days off a month.

Mr. ANDERSON. What is the increase?

Mr. REESE. Six men.

The CHAIRMAN. How big a power plant have you?

Mr. REESE. The central power plant with the small supplementary plant at the greenhouses for winter use aggregate 1,700 horsepower. There are eight boilers, and the plant furnishes heat for the department and generates electricity.

Mr. ANDERSON. You have one central heating plant?

Mr. REESE. We have one central heating plant and a small supplementary plant at the greenhouses used in winter.

Mr. ANDERSON. You have eight boilers. How many firemen all together?

Mr. REESE. Fifteen.

Mr. ANDERSON. How many tons of coal do you use in this plant?

Mr. REESE. Nine thousand tons.

The CHAIRMAN. How many firemen are you transferring from \$720 to \$1,080?

Mr. REESE. Ten.

The CHAIRMAN. This is a larger item—

Mr. ANDERSON. They didn't have that many.

The CHAIRMAN. How many did you transfer from the statutory roll to these lump-sum rolls?

Mr. REESE. Eight.

The CHAIRMAN. They were on the statutory roll at \$720?

Mr. REESE. Yes, sir.

The CHAIRMAN. Did you transfer them to the lump-sum rolls at \$1,080?

Mr. REESE. At \$3.36 a day and later (July, 1919) changed them to \$1,080 per annum.

The CHAIRMAN. And you now want to transfer them back to the statutory roll at \$1,080?

Mr. REESE. Yes, sir; exactly.

The CHAIRMAN. They are doing exactly the same work as they did before?

Mr. REESE. Yes, sir.

The CHAIRMAN. They have no additional responsibilities?

Mr. REESE. No, sir.

The CHAIRMAN. That is absolutely contrary to what we have been told here a number of times.

Mr. RUBEY. They have set out here, Mr. Chairman, what they have done; they have given us all the details, and have shown why it was necessary to take the course they did. This was an unusual case; there was nothing else for the department to do, and I think we ought to be fair about it.

The CHAIRMAN. But have they the authority?

Mr. RUBEY. We ought to be fair enough to the department not to say that this is contrary to what we have been told, when they are coming here and telling us what has been done.

The CHAIRMAN. They are telling us——

Mr. REESE. We had to have the firemen or close down the plant. These men came to us and said that they could not live on \$720 and were going to quit.

The CHAIRMAN. Mr. HARRISON, how do you explain that?

Mr. HARRISON. You may recall that last year, when I was before the subcommittee, I quoted the language of the law dealing with transfers to lump-sum fund rolls. Originally, the law prohibited absolutely the transfer of anyone from a statutory to a lump-sum roll at an increased salary unless there had been an increase in his duties and responsibilities. It was later amended by Congress so that it now contains this proviso:

Provided, That this section shall not apply to mechanics, artisans, their helpers and assistants, laborers, or any other employees whose duties are of similar character and required in carrying on the various manufacturing and constructing operations of the Government.

The comptroller has held that this proviso is applicable to laborers and mechanics employed in the Department of Agriculture. There is, therefore, no restriction on the transfer of the "mechanics, artisans, their helpers and assistants, laborers," etc., and such transfers can legally be made even though the duties of the employees involved are not changed in any way.

The statement has been made here repeatedly, in general terms, that the law prohibits transfers from statutory to lump-sum rolls at increased salaries unless there has been a change in the duties and responsibilities of the employees concerned, but, as I have indicated here to-day, and on several other occasions, Congress made a special exception in the cases of "mechanics, artisans, their helpers and assistants, laborers, or any other employees whose duties are of similar character and required in carrying on the various manufacturing and constructing operations of the Government."

The CHAIRMAN. The fact of it is that Congress has had nothing to say about the matter in this case.

Mr. HARRISON. Mr. Chairman, this is what happened: These men were transferred——

The CHAIRMAN (interposing). These men were on the statutory roll. They were transferred to the lump-sum rolls at an increased salary. Now you are transferring them back to the statutory roll from the lump-sum rolls. It appears that Congress has had nothing to say as to the salaries.

Mr. RUBEY. I want to make a statement in that connection. This is a clear case of where the Department of Agriculture had to have men to fire their boilers or shut down the plant, and, in order to

get the men, they had to pay them more money. Hence they took this course. Now, so far as I am concerned, I think they did the right thing. The matter is now before the committee and will be before the committee when we go into executive session to discuss what shall be done, and the committee can pass on it at that time. I think the department has been fair. They have told exactly what they did, and why they did it, and we have got the record before us, and the Congress and this committee have got all the information in a fair, square, open way.

Mr. HARRISON. I would like to say a word here. The department simply could not close down its plant and it therefore took the course described by Mr. Reese to retain its trained firemen. We could not secure the services of any sort of firemen at the statutory rates available, especially in view of the fact that the Potomac Electric Power Co. was paying \$5 a day. You can imagine what would happen if our power plant, the artery of the department, had been shut down. The damage would have been incalculable.

Mr. LESHER. What would have happened had you closed down the plant? Would the department have been compelled to lay off its clerks and paid them just the same?

Mr. HARRISON. It is difficult to indicate the disastrous effect which the closing down of our plant would have had on our work or what it would have cost the Government.

Mr. REESE. The operation of all of the elevators would have been paralyzed without the operation of the power plant, and no artificial light would have been available.

There are four places as firemen at \$720 each, which are dropped for the reason that we can not permanently fill the places.

Mr. RUBEY. These 4 are up here among the 10?

The CHAIRMAN. Why were they dropped?

Mr. REESE. We can't fill the places permanently at that salary.

The CHAIRMAN. Why not say they are dropped because they are employed at an increased salary?

Mr. REESE. These four places under item 61 are actually dropped.

The CHAIRMAN. You had four more than you needed?

Mr. REESE. At that salary. This note explains that we are dropping four places because it has been found impossible to fill them at this low salary, \$720. At the time these estimates were made up the places were vacant; they have since been temporarily filled by men appointed "pending certification," who will be dropped if these estimates are approved.

The CHAIRMAN. You are going to employ others at increased salaries?

Mr. REESE. Not necessarily.

The CHAIRMAN. An increase in salary is provided under item 59?

Mr. REESE. Yes, sir.

The CHAIRMAN. You propose to drop four of them at \$720 and to add six at \$1,080?

Mr. REESE. The 10 places at \$1,080 are added by transfer from the lump-sum rolls. The men are being carried this year on these lump-sum rolls. Now we are simply asking to have them transferred to the statutory roll at the salaries they are now receiving. The action suggested here does not involve any increases in salaries.

The CHAIRMAN. You mean to say that you have four men more than you need, whom you are going to drop?

Mr. REESE. We have four places at \$720 more than we need.

The CHAIRMAN. You are proposing to replace them?

Mr. REESE. We are dropping those places because we can not get the men permanently at that salary.

The CHAIRMAN. Is it not a fact that you are going to drop those four men at \$720 and employ others at \$1,080?

Mr. REESE. No.

The CHAIRMAN. You are adding six at \$1,080. Why do that if you have four at \$720 that you do not need?

Mr. REESE. We wish to drop four places at \$720.

The CHAIRMAN. Those vacant places have been filled at \$1,080, have they not. Your note states that four firemen are dropped at \$720, and you are employing other firemen at \$1,080?

Mr. REESE. I will endeavor to clear up this situation as to the firemen. At the present time we have the following firemen:

10 firemen at.....	\$1,080
1 fireman at.....	1,080
1 fireman at.....	840
8 firemen at.....	720

The one temporary fireman at \$1,080 will be dropped at the close of the heating season.

Of the eight places at \$720 per annum four will be dropped if the estimates are approved. Meanwhile they are filled by men "pending certification," as we can not secure permanent men at this salary. The four men occupying those places will be dropped. At present they are employed as coal passers and for relief at the greenhouse power plant. If the estimates are approved the department will have in the next fiscal year the following firemen:

10 firemen at.....	\$1,080
1 fireman at.....	840
4 firemen at.....	720

A total of 15. This number is the minimum at which the power houses can be successfully operated.

The CHAIRMAN. Under item 101 you have one carriage driver at \$600, changed to one messenger or laborer, \$600. You state in the note that the position of carriage driver is now vacant and that it has not been possible to fill it at the salary provided. The services of an additional laborer, however, are needed, and the change in title suggested will permit the use of the place for that purpose. What does he do?

Mr. REESE. We desire to change that place from one carriage driver to one messenger or laborer at the same salary.

The CHAIRMAN. You are going to dispense with the carriage driver?

Mr. REESE. Yes, sir.

The CHAIRMAN. He is not to be employed at all?

Mr. REESE. Not in that capacity.

The CHAIRMAN. Will he do the same work?

Mr. REESE. There isn't anybody in that place.

The CHAIRMAN. What do you propose to do?

¹ Temporary.

Mr. REESE. Our purpose is to change the designation from carriage driver to messenger or laborer.

The CHAIRMAN. And pay him how much?

Mr. REESE. \$600.

The CHAIRMAN. Who takes this place as driver?

Mr. REESE. No one.

The CHAIRMAN. There is to be no driver from now on?

Mr. REESE. Not in that place. We have other carriage drivers, carried at different places on the roll.

The CHAIRMAN. What are you going to pay them?

Mr. REESE. There is another carriage driver under the item for skilled laborers at \$960.

The CHAIRMAN. You are increasing the salary from \$600 to \$960?

Mr. REESE. No, sir; it is not the same place. This \$960 place is for another driver.

The CHAIRMAN. Is he doing the same work that he has done heretofore?

Mr. REESE. Yes, sir.

The CHAIRMAN. Then you are increasing his salary \$360?

Mr. REESE. No, sir; there is no increase in this man's pay. This \$600 place is merely a change in title.

The CHAIRMAN. You say you are going to continue the services of the \$600 man?

Mr. REESE. Not in that place; not that man.

The CHAIRMAN. Not the man; but the job.

Mr. REESE. We have a carriage driver's place at \$600 which was vacant when these estimates were prepared.

The CHAIRMAN. It is vacant?

Mr. HARRISON. I understand that we now have a laborer in that place. The Civil Service Commission gave us permission to employ a laborer until we could get the title changed. We are, therefore, recommending that the title be changed to "messenger or laborer."

The CHAIRMAN. Is this the situation: You had a carriage driver at \$600?

Mr. REESE. Yes, sir.

The CHAIRMAN. You had to dispense with his services because you could not fill the place at that salary, and you are now employing another carriage driver at \$960 on some other roll or under some other designation? You find it necessary to do that, nobody finds fault with it, but we should have the facts—are those the facts?

Mr. REESE. No, sir. We have had two carriage drivers, not counting this man at \$600. One is paid \$960 and is carried under item 95 as a skilled laborer. Another carriage driver is paid \$840. In addition to these two, we had this third place, under item 101, which we could not fill with a carriage driver at \$600. But, as Mr. Harrison has explained to you, the Civil Service Commission gave us authority to fill the place with a laborer at \$600, with the understanding that the department would recommend in the estimates that the title of the place be changed, and this we are now proposing. I am trying my best to explain it, Mr. Chairman, and Mr. Harrison has explained that the Civil Service Commission gave us permission to employ a laborer at \$600.

Mr. ANDERSON. You have here now one carriage driver at \$960?

Mr. REESE. Yes, sir.

Mr. ANDERSON. You have another at \$840?

Mr. REESE. Yes, sir.

Mr. ANDERSON. Another at what?

Mr. REESE. Another place at \$600, which we have filled with a laborer, not being able to get a carriage driver.

Mr. ANDERSON. There is no driver in that place, and you can employ a laborer at \$600 to drive the carriage?

Mr. REESE. No, sir; we want a change in designation.

Mr. HARRISON. He will not drive the carriage except possibly as a relief.

The CHAIRMAN. How much are you paying the laborer?

Mr. REESE. \$600.

Mr. ANDERSON. And he is working as a carriage driver?

Mr. HARRISON. He is working and will continue to work as a laborer, although at times he may relieve the carriage drivers. The Civil Service Commission suggested that we change the designation of this place to that of laborer.

Mr. McLAUGHLIN of Michigan. How many carriages have you for which you provide drivers?

Mr. REESE. We have four carriages, but not four drivers.

Mr. McLAUGHLIN of Michigan. For whose use are they?

Mr. REESE. For the use of the Secretary and of the disbursing officer when he goes up to the Treasury to draw money to pay the employees, and for other official business.

Mr. McLAUGHLIN of Michigan. Has the Secretary's Office any automobiles?

Mr. HARRISON. No, sir; it has not.

Mr. LESHNER. Could it save time if it had any?

Mr. HARRISON. Unquestionably.

Mr. McLAUGHLIN of Michigan. How many horses do you keep for that particular service?

Mr. REESE. Six.

Mr. RUBEY. I had supposed that the Secretary used a carriage because he preferred to drive horses rather than use an automobile, as I notice that some of the other Secretaries do. The Postmaster General likes to ride around in a carriage, and I have noticed two other Cabinet officers riding in carriages, and I supposed that the Secretary of Agriculture preferred them.

Mr. HARRISON. As a matter of fact, he does, Gov. Rubey. At the same time he recognizes full well that automobiles are great time savers, especially in covering considerable distances—for instance, in going from one section of the city to another.

Mr. RUBEY. Is it really cheaper to maintain automobiles than it is to maintain carriages and horses?

Mr. HARRISON. I imagine that is true. As a matter of fact, the department has a real need for some machines here in Washington. You know that the department is located away from the center of the city and away from the other branches of the Government. It is an exceedingly difficult place to get to, and the time consumed annually by the officers of the department in going to the other places is

enormous in the aggregate. The car line does not render very satisfactory service. Altogether it would be a real saving to provide a few machines to be used solely for official business.

Mr. McLAUGHLIN of Nebraska. Do you suppose it would be possible to get a few of these Army cars that are rusting away?

Mr. HARRISON. Under the provisions of section 7 of the Post Office appropriation act of February 28, 1919, some cars have been turned over to the department for use in connection with road-building operations under the provisions of the Federal aid road act. Most of these cars have been distributed to the States, but, in accordance with the law, a small percentage of them have been retained by the department for the use of the district and field engineers of the Bureau of Public Roads in connection with road-building operations. A few are assigned to district No. 10, the headquarters of which are located here, but the machines are used in inspecting road projects in the States covered by the district—Maryland, Pennsylvania, Virginia, and other States.

The CHAIRMAN. In the maintenance of these automobiles you have not authority to repair them nor to buy gasoline, but you have authority to hire machines.

Mr. HARRISON. A law passed in 1914 prohibits us from purchasing or maintaining motor-propelled passenger-carrying vehicles without specific authority from Congress. We can not buy any passenger-carrying machines for use in the District of Columbia, but this is not so with reference to trucks.

The CHAIRMAN. New legislation will be required to take care of that?

Mr. HARRISON. New legislation will be required before we can purchase any passenger-carrying machines.

The CHAIRMAN. And maintain them.

Mr. HARRISON. And maintain them either.

The CHAIRMAN. I am told that you can hire a car, but that you can not buy gasoline with which to operate it.

Mr. HARRISON. Yes; we can hire machines. We have requested Congress to give us authority to maintain the cars which we have secured from the War Department under section 7 of the Post Office appropriation act of February 28, 1919. A provision carrying this authority has been inserted in the Kahn bill, which has been favorably reported by the Committee on Military Affairs.

The CHAIRMAN. The Reavis bill is a substitute for the Kahn bill; I believe no legislation will be added to that.

Mr. HARRISON. We would like very much then to have inserted in the Agricultural appropriation bill a provision giving us authority to maintain the machines secured from the War Department.

The CHAIRMAN. Will you submit a suggestion?

Mr. HARRISON. I shall be very glad to do so and I hope that some legislation will be enacted to take care of the situation.

The CHAIRMAN. How many Assistant Secretaries have you?

Mr. HARRISON. We have one and one vacancy.

The CHAIRMAN. The law provides two.

Mr. RUBEY. It provides for two, but one is not filled.

Mr. ANDERSON. You are having some difficulty in keeping them.

Mr. HARRISON. You will recall that the men who occupied the

positions created during the war were borrowed from the States and they came here to serve merely during the existence of the emergency. After the emergency was over they returned to their former duties. I refer to Mr. Pearson, Mr. Ousley, and Mr. Christie. It was necessary for Mr. Pearson to return to Iowa before the expiration of the war. We had three Assistant Secretaries during the war. One was provided for in the regular appropriation bill, and the other two in the food production act. In the appropriation bill for the current year Congress made provision for two Assistant Secretaries regularly. At the present time we have one Assistant Secretary and there is one vacancy which has not been filled because of the difficulty of getting the right sort of man for the place at the compensation available.

The CHAIRMAN. Is there anything more, Mr. Reese?

Mr. REESE. I have nothing to add, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. Reese.

(The committee thereupon proceeded to consider the estimates of the Bureau of Entomology.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Friday, December 19, 1919.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. Mr. Harrison, whom do you desire to have heard first?

Mr. HARRISON. Mr. Chairman, Dr. H. C. Taylor, Chief of the Office of Farm Management, is here, and if it is agreeable to the committee he will present the estimates of that office.

BUREAU OF FARM MANAGEMENT AND FARM ECONOMICS.

The CHAIRMAN. I might say to the committee I have a communication here from the Secretary in reference to the Office of Farm Management which, without objection, will be inserted in the record. (The letter referred to follows:)

WASHINGTON, D. C., *December 12, 1919.*

Hon. GILBERT N. HAUGEN,
*Chairman Committee on Agriculture,
House of Representatives.*

DEAR MR. HAUGEN: In considering the estimates for the Office of Farm Management for the fiscal year 1921 I would like to suggest that \$50,000 be made available for expenditure immediately upon the passage of the appropriation bill. As you will readily understand, it would be highly desirable to begin the cost-of-production studies contemplated by the estimates with the opening of the crop season. If funds were available, therefore, for expanding the studies by the 1st of March or the 1st of April, it would be possible to do a large amount of effective work during the coming season. On the other hand, if the increased funds recommended are not provided until July 1 of next year it would be necessary to defer much of the work until the following spring.

I have asked Dr. H. C. Taylor, Chief of the Office of Farm Management, to discuss this matter in detail when he appears before the committee.

Very truly, yours,

D. F. HOUSTON, *Secretary.*

The CHAIRMAN (continuing). We will be glad to hear from you, Dr. Taylor.

STATEMENT OF DR. H. C. TAYLOR, CHIEF OF THE OFFICE OF
FARM MANAGEMENT, DEPARTMENT OF AGRICULTURE.

Dr. TAYLOR. I have put in your hands a brief of what I wish to present. On the first page is an outline of the different lines of work to be undertaken by the Office of Farm Management, as outlined by the special committee called by the Secretary last January and February to draw up a plan for the reorganization of the Office

of Farm Management. You will see that it includes the cost of production, farm organization, farm finance, farm labor, agricultural history and geography, land economics, and farm-life studies.

I wish to give special attention to the subject of cost of production. Preliminary work has been started in this field. Necessarily it had to be on a rather small scale, but cost of production studies have been made in the cost of producing cotton, wheat, tobacco, and sugar, and special, detailed studies have been undertaken in those regions where the agriculture is of a mixed character, such as in the Corn Belt, where you can not find the cost of producing one specific product without getting detailed records from the whole farm. In a number of States special work has been organized to give detailed results. This work is going on in Ohio, Indiana, Iowa, Missouri, Kansas, and Montana.

I wish to give you some notion of the kind of results that can be gotten from the cost studies.

Mr. TINCHER. Let me understand you: Is this [referring to Dr. Taylor's detailed outline of work] to go in as part of the hearings?

Dr. TAYLOR. If you like. I have prepared this statement especially in order to get the matter before you, and thought the simplest way would be to put it in your hands and then to discuss the points involved.

Mr. TINCHER. Do you think it ought to go into the hearings, Mr. Chairman?

The CHAIRMAN. All of it?

Mr. TINCHER. Yes.

The CHAIRMAN. It occurred to me that we might print the first page here. That gives in detail the projects. I take it you will cover most of it in your statement. I am not sure that the charts can be printed without special authority from the House.

Mr. HARRISON. Mr. Chairman, we can eliminate the charts. I think it would be very helpful to the committee to have the statement available in the hearings. It will cover only five or six printed pages.

The CHAIRMAN. Do you expect to cover this fully in your remarks?

Mr. TAYLOR. I only expect to refer to it and to discuss this chart which can not well be printed.

The CHAIRMAN. Then I believe it had better go in.

Mr. RUBEY. Yes; it had better go in.

(The statement referred to follows, the charts being omitted:)

STATEMENT OF THE CHIEF OF THE OFFICE OF FARM MANAGEMENT IN SUPPORT OF THE ESTIMATES FOR THE BUREAU OF FARM MANAGEMENT AND FARM ECONOMICS FOR THE FISCAL YEAR 1921.

THE IMPORTANCE OF EXPANDING THE WORK IN FARM MANAGEMENT AND FARM ECONOMICS.

Farm management and farm economics is an important branch of agricultural research that has not yet received adequate attention in the Department of Agriculture.

The problems which relate to the improvement of varieties of plants, the introduction of new plants from foreign countries, the improvement of cultural methods and practices, the control of plant diseases, insect and animal pests, the problems of soil fertility, the improvement of breeds of farm animals and

in methods of feeding and handling them, and the control of animal diseases—in short the problems which relate to the growing of particular crops or kinds of animals—have long received more adequate attention than have those which bear upon the effective organization of the farm.

It is the function of the Bureau of Farm Management and Farm Economics to study the problem of combining all these individual lines of production into balanced systems of farming that will make for more efficient use of land, labor, and equipment, and the more intelligent combination of crops and livestock enterprises, to the end that costs may be reduced, profits increased, and agriculture as a business put on a more satisfactory basis. Until recent years little attention has been given to this problem. Marketing, with its numerous economic questions, is now beginning to get attention in some measure commensurate with the importance of the problems involved. The next important step contemplated by the Department of Agriculture is the expansion of the work in farm management and farm economics in order that this important line of activity may be developed to the point where the demands for information in this field may be adequately met.

OUTLINE OF RESEARCH WORK IN FARM MANAGEMENT AND FARM ECONOMICS AS RECOMMENDED BY SPECIAL COMMITTEES ON THE REORGANIZATION OF THE OFFICE OF FARM MANAGEMENT.

- I. Cost of production :
 1. Final records.
 2. Enterprise records.
 3. Complete cost records.
 4. Price relations.
 5. Basic unit factors of cost.
- II. Farm organization :
 1. Types of farming.
 - a. Determination of enterprises.
 - b. Plan or combination of enterprises.
 2. Size of business.
 3. Farm plan or layout.
 4. Effective use of labor and equipment.
 5. Intensity of production.
 6. Business methods.
- III. Farm finance :
 1. Methods of financing.
 2. Insurance.
 3. Taxation.
 4. Other financial relations.
- IV. Farm labor :
 1. Supply and movement.
 2. Trend of population.
 3. Living and housing problems.
 4. Creating new productive enterprises for farm labor.
 5. Standards of supervision and compensation for farm labor.
- V. Agricultural history and geography :
 1. Trend of agricultural development.
 2. Shifts of agricultural production.
 3. Relation of American to foreign agriculture.
 4. Supervision of Atlas.
- VI. Land economics :
 1. Land resources.
 2. Land values.
 3. Land ownership and tenancy.
 4. Land settlement and colonization.
 5. Land policies.
- VII. Farm life studies :
 1. Rural home life.
 2. Opportunities for social contacts in typical rural communities.
 3. Rural organization.
 4. The relation of educational and religious institutions to farm-life problems.

VII. Farm life studies—Continued.

5. The relation of health and the various forms of disability to rural welfare.
6. Social effects of the various types of farm labor, tenancy and landlordism.

COST OF PRODUCTION AND FARM ORGANIZATION.

Cotton-cost studies have been made during 1919 in 10 areas in South Carolina, Georgia, Alabama, and Texas. When completed these studies will show the basic elements of the cost of producing cotton on 830 farms. Wheat-cost data are being obtained in Kansas, Missouri, Nebraska, Minnesota, North Dakota, and South Dakota on approximately 650 farms. The study of the cost of producing sugar beets has been continued, cost data for about 260 farms having been obtained this year. These farms represent five areas in Utah and Idaho. The cost of producing tobacco is being studied on 150 representative tobacco farms in Kentucky in cooperation with the State experiment station. In cooperation with the experiment stations in Indiana, Illinois, Iowa, Missouri, and Nebraska, accounts are being kept this winter on 25 farms in each State with a view to determining the cost of fattening cattle and the place of cattle feeding in the organization of the farm.

In addition to these special studies, complete detailed accounts are being kept on about 150 farms in cooperation with the State colleges and experiment stations in Ohio, Kansas, Minnesota, and Montana. Such accounts are especially valuable in studying the problems of farm organization, and they contribute material information regarding the basic elements of cost. Farm-business analysis surveys have been continued in Georgia, Florida, North Carolina, West Virginia, New Hampshire, Ohio, Indiana, Iowa, and Wisconsin. Cooperative work in this line has been started in Maryland, New Jersey, Washington, and Idaho. In the application of the accounting method to the study of cost of production much of the work can be carried on most effectively in conjunction with studies in farm organization. This is especially true where more than one crop is produced on the same farm, as is generally the case.

It is recognized that in cost studies many times the number of farms covered thus far should be studied to insure results that may be considered as authoritative. With the limited funds available for this year the aim has been to develop practical methods of investigation which will yield the results desired when carried out on the more extensive scale contemplated in the present budget.

There is an insistent demand for a study of the cost of the different kinds of farm power. In this day, when so much attention is being given to the introduction of mechanical power, it is a matter of great consequence that cost data should be available which will give the farmer a basis of deciding which kinds of power or which combination of the different kinds of power will enable him to farm most effectively. Plans are being made for the starting of this work so soon as funds are available.

EXAMPLES OF COST PRODUCTION DATA—COST OF PRODUCING COTTON IN 1913 AND 1918, SUMTER COUNTY, GA.

In Table I is shown the number of farms producing cotton at various costs for the two years 1913 and 1918. For 1913 the costs are shown for 534 farms, 268 of which are white-owner operated farms, 49 white tenant, 31 colored owner, and 186 colored-tenant operated farms. In 1918 there were 550 farms, 280 of which were white owner, 56 white tenant, 48 colored owner, and 166 colored-tenant operated farms.

These figures show a wide range in the cost of production on different farms for each year. In 1913 six farms produced cotton below 7 cents per pound, while three had costs above 30 cents per pound. In 1918 only two farms had costs of less than 13 cents per pound, while on 10 farms the costs were above 50 cents per pound. Seventeen per cent of the farms, producing 17 per cent of the cotton in 1913, had costs below 10 cents per pound, while 19 per cent of the farms, producing only 9 per cent of the cotton, had costs of 16 cents or more per pound. In 1918, 16 per cent of the farms, producing 25 per cent of the cotton, had costs under 20 cents per pound, while 16 per cent of the farms, producing only 7 per cent of the cotton, had costs of 35 cents or more per

pound. The chart shows that in 1913 over 50 per cent of the farms produced cotton within a range of 10 to 14 cents per pound, and in 1918, 50 per cent of the farms produced within a range of 20 to 30 cents per pound.

TABLE II.—*Distribution of cost of producing cotton on farms operated by white owners, Sumter County, Ga.*

[1913—268 farms; 1918—280 farms.]

Item of cost.	1913			1918		
	Cost per acre.	Per cent of total cost.	Cost per pound of lint.	Cost per acre.	Per cent of total cost.	Cost per pound of lint.
Labor.....	\$16.52	42	\$0.051	\$34.46	45	\$0.108
Fertilizer.....	6.11	16	.019	9.23	12	.029
Ginning.....	.93	2	.003	1.76	2	.005
Use of land and overhead.....	10.44	26	.033	21.37	28	.067
Other costs.....	5.28	14	.016	9.64	13	.030
Total.....	39.28122	76.46239

Table II shows the items that go to make up the cost of producing cotton, divided into five groups: Labor, fertilizer, ginning, use of land, and "other costs."

Labor was the largest single cost connected with the growing of cotton. The labor cost in 1913 was \$16.52 per acre, or 5.15 cents per pound of lint, and \$34.46 per acre, or 10.79 cents per pound of lint, in 1918. The expense for the use of cotton land, including real estate overhead expense, was second in importance. This cost in 1913 was \$10.44 per acre, or 3.26 cents per pound of lint, and \$21.37 per acre, or 6.9 cents per pound of lint, in 1918. The cost of fertilizer was \$6.11 per acre, or 1.9 cents per pound of lint, in 1913, and \$9.23 per acre, or 2.89 cents per pound of lint, in 1918. Ginning amounted to 93 cents per acre, or 0.3 cent per pound of lint, in 1913, and \$1.76 per acre, or 0.5 cent per pound of lint, in 1918. "Other costs," including interest, shelter, and depreciation on machinery and mules, and minor items, amounted to \$5.28 per acre, or 1.65 cents per pound of lint, for 1913, and \$9.64 per acre, or 3 cents per pound of lint, in 1918. The total cost on these farms was \$39.28 per acre, or 12.25 cents per pound of lint, in 1913, and \$76.46 per acre, or 23.9 cents per pound of lint, in 1918. A comparison of the figures for the two years shows a marked increase in cost, but a striking similarity between the two sets of figures showing per cent of total cost.

TABLE III.—*Basic requirements in producing an acre of cotton.*

.....	3.46	6.72	
.....	7.37	12.79

a Lowest and highest, 6 farms reporting.

Table III shows the nature of the cost data that are being collected for various farm products. The elements or items of cost are expressed, wherever possible, in terms of quantity requirements. Not only averages of cost items but arrays and ranges of costs are calculated in order to bring out the wide variations that exist in crop-production costs. In this illustration (Table III) the data represent the results of a cost of cotton study on 85 farms in Laurens County, Ga. The range is shown by presenting as extremes the average of the 10 farms showing the lowest requirements for each item, and of the 10 farms showing the highest requirements. An important consideration in any comprehensive expression of cost, in which many individuals are concerned, is that of the variations that exist, which are usually lost sight of in a general average. This is well shown by the differences in the various elements of cost between the two groups of farms illustrating range.

To calculate the money cost per acre or per pound of lint cotton from the data shown in this illustration it is necessary to place current prices on the labor, fertilizer, manure, and seed items in order to express the quantity elements in dollars and cents. In the final determination of the cost per acre or per pound of lint, it is important to have in mind the type of cotton production—that is, whether the crop is produced on owned farms by the owners, under the cash-rent system, or under the cotton-rent plan—inasmuch as there is a wide variation on farms in the three tenure groups in the item of land rental, as well as on farms within each group. This is illustrated in the accompanying example under the item "use of land."

FARM FINANCIAL RELATIONS.

During the past year attention in this field has been confined to agricultural insurance—loss by fire, windstorm, and tornado, loss of live stock by death, and loss of crops by hail. Especial attention has been given to the introduction of approved systems of accounts for the use of cooperative insurance companies; the improvement of their management through suggestions as to the most successful and equitable means of raising funds for payment of losses; and the prevention of losses by thorough systems of inspection of risks.

In addition to insurance investigations the budget contemplates the study of a number of economic problems directly affecting the welfare of the farmer. Improvement in the methods of financing and maintaining efficient rural telephone service operated on a cooperative basis demands attention. Effectiveness of our present credit system in aiding landless farmers to become the owners of the land they till, together with the degree of efficiency with which needy farmers are able to secure season-to-season operating capital, are matters worthy of deep consideration. Matters of rural taxation are important. There is a question of double taxation in those cases in which the farmer pays a tax on the full value of his land, half the value of which is covered by a mortgage, and who at the same time is compelled to pay an increased interest charge to cover the tax on this mortgage. The relation of the personal property tax to the improvement of agriculture deserves careful consideration. The general problem of taxation in its relation to the problems of land ownership and tenancy should receive attention. It is proposed that facts be compiled which will aid the correct solution of these rural financial problems.

FARM LABOR.

The farm-labor problem is becoming increasingly serious in the United States. It is especially important that studies be made which will point to the maintenance of an adequate supply of efficient help on the farms if American agriculture is to meet the demands made upon it. It is desired to collect the facts relating to the supply and movement of farm labor in the different parts of the United States and to ascertain the trend of agricultural population in its relation to the future labor supply. Living and housing conditions essential to a contented life for the hired man on the farm, the provision of continuous employment, and the adjustment of the question of compensation for farm labor demand special attention. Continuous employment and satisfactory compensation are closely connected with the problems of farm organization and the introduction of new productive enterprises which will provide a more even demand for labor throughout the year and yield a return which will justify its employment. No funds being available no special work is being done on these subjects during the present year.

AGRICULTURAL HISTORY AND GEOGRAPHY.

The work in this section consists in bringing together the historical and geographical facts which lead to a better understanding of agricultural conditions.

Especial attention is given to the history of agricultural development as influenced by geographic and economic forces. Studies of this kind are now being made of sheep, wheat, cattle, and dairying. The purpose of these historical studies is to show the effect of change in prices on production and to show which conditions are temporary and which are permanent in order to interpret present facts and forecast future developments.

The geographic studies show the relation of climate, soils, topography, markets, the character and density of the population, and other geographic facts, to the utilization of land, farm practices, size of farms, and to the kinds of crops and live stock which can be grown with best results in each part of the United States. This work contributes to the solution of problems in farm organization, land economics, and various other lines of research by supplying facts which give breadth of view and balance to judgment.

The responsibility of preparing the Atlas of American Agriculture is assigned to this section of the office, though much of the work is done in other bureaus of the Department of Agriculture. Much information has been accumulated in different bureaus as a result of the investigation of special problems. In the Atlas it is attempted to bring together and organize the best information available regarding the history and present condition of agriculture in every section of the United States.

LAND ECONOMICS.

The relationship of the farmer to the land is becoming a more and more serious problem. Tenancy is increasing rapidly in the best of our agricultural regions. Land values have increased to such levels that it is becoming more and more difficult for the landless man to acquire the ownership of a farm. In fact, speculation in land has pushed values so high in many sections of the country that an ordinary farmer can not earn enough profit on the value of the land to pay interest on the investment in it. Frequently it does not pay to buy land for the purpose of farming it. A recent investigation made by the Division of Land Economics showed that nearly one-half of the large increase in the price of lands in certain sections of the Corn Belt during the past year has gone into the pockets of people who are not farming the land—a large number of them city speculators. Enormous areas of our best farming lands are controlled by absentee owners instead of by the farmer who tills them. The condition is all the more unsatisfactory because the relations between landlords and tenants have for the most part not been adjusted satisfactorily with a view to stimulating good methods of agriculture and the conservation of the soil.

In the semiarid regions of the West is an area of land in extent as great as the original Thirteen Colonies where the conditions under which the land is held are such that there is little effective control over the use of the range. In the Southwest alone losses of livestock aggregating millions of dollars have occurred during the last two years because the relation of the ranchmen to the land precluded any effective conservation of the range in anticipation of drouth. There are considerable areas which are on the border line between farming land and grazing land. No land policy has yet been devised which is sufficiently elastic to provide properly for these alternative uses. In certain sections thousands of farmers have experienced tragic failure during the past few years because they have been induced to settle lands that were unsuitable for successful farming.

In the great areas of cut-over lands and swamp lands no careful studies have been made to determine what classes of land can be economically used for farming and what classes should be reserved for other purposes. Little progress has been made to determine what methods of improvement and utilization will prove most economical. Such questions as those relating to the cost of rendering the land available for use, the present tenure and prices of the land, what agricultural enterprises would prove most profitable, minimum size of farm required to support a family in comfort, kinds of equipment needed and methods of improvement to be employed, sources of credit, marketing arrangements, and conditions of transportation remain largely unsolved. At the present

time settlement of these lands is being promoted by methods which result in an enormous number of failures, so that many sections that are capable of developing a prosperous agriculture have been given an evil reputation which retards their development.

During the past year, with the limited funds available beginnings have been made in the investigation of the following subjects:

- (1) Methods of renting farms in dairy, wheat, and cotton regions with a view of determining what kinds of lease contracts would result in improved methods of farming and a fair division of returns.
- (2) Land values and land speculation in the Corn Belt.
- (3) Relationship of land tenure to use of land in the western ranges.
- (4) Methods of land settlement in the cut-over lands of the Great Lakes region.
- (5) Causes and effects of the increase of tenancy in certain regions—especially in the Cotton Belt.
- (6) Methods by which tenant farmers acquire land.
- (7) Classification of land resources and economical methods of land utilization in the cut-over lands of the Great Lakes region.

Because of the limited funds available the scope of these studies has been greatly restricted. The proposed budget contemplates an increase in the extent and scope of these studies in order that the information may be obtained necessary for the development of land policies that will remedy the serious and increasing maladjustment in the relation of the farmer to the land which he tills.

FARM LIFE STUDIES.

In every effort to improve agriculture, one important question repeatedly comes to the front. How is the life side of farming to be developed and enriched so as to keep step with the upward trend of the economic side of farming? This is by no means a question to be answered lightly, nor is it one to be solved by any single, simple remedy. Prosperity alone on any particular farm, for example, will not solve the life question for the family on that farm. This is true because the satisfactions of life are so largely a matter of community life, community activities, community institutions, and community ideals, all of which are developed slowly and not purchasable with money. In fact, many a successful and high-spirited farmer, on attaining a competence, has left the farming enterprise and farming community for residence in town or city in order to obtain the satisfactions of life which he has earned with his industry and thrift, but which he has failed to find in the country community. His place on the farm is altogether too often filled by a less efficient farmer with a family whose attainments and ideals are undeveloped. Such a turn of affairs just at the time when economic prosperity has been achieved on the farm, is a distinct loss to agriculture as a whole and to the country community in particular.

The deficiencies in country living conditions are many. Moreover the community ailments of our farm populations are in danger of becoming more or less chronic. There are altogether too many sections of the United States, it is to be feared, where the farmer is badly handicapped in his attempt to maintain a thorough-going American standard of living for his family. The serious deficiency seems to be primarily one of institutions—institutions of a nature, moreover, which in town and city have become commonplace. How to furnish our farm population with the adequate social instruments of a full American life is an important matter for inquiry.

In the unstable conditions of family life on the farm, scientific agriculture finds a peculiar impediment to its rapid advance. If the well-known tendency of progressive and successful farmers to leave farming on becoming prosperous should long continue, a still more serious hindrance to modern methods of agriculture would present itself, for tradition and custom rather than up-to-date methods would then quite likely have right of way in farm practice, and business inferiority would menace our rural citizenship. This condition of general rural social instability should be carefully investigated.

Farm-life studies have been designed to inquire into the deficiencies of country living conditions. It has been demonstrated that rural life is susceptible of scientific investigation. There are no lines of research more worthy of Federal support than the scientific study of farm life and the discovery of methods of giving to farm life permanent satisfaction.

Only a small beginning has been made in this important field. Preliminary studies have been worked out on community centers, rural organizations, the social effects of tenancy, and the essential educational basis of a sound country life.

DEMONSTRATION ACTIVITIES.

The end in view in the work of the Bureau of Farm Management and Farm Economics is better farming and better living. It is essential, therefore, that the results of investigation be carried to the farmers. It is also essential that the educational work done through publications be supplemented by demonstration work carried on in cooperation with the States Relations Service.

Farm management demonstration work is now being conducted in 26 States. The demonstrators are maintained jointly by the United States Department of Agriculture and the agricultural colleges.

The farm management demonstrators constitute a trained force available for giving immediate attention to economic problems. The duties of the farm management demonstrators are:

1. To work with county agents and other agencies in bringing to the attention of farmers, in terms of their own farm operations, the principles of farm management.
2. To demonstrate to farmers a practical method of recording, summarizing, and analyzing the farm business to serve as a basis for modifications designed to increase the effectiveness of their work.
3. To demonstrate to farmers the importance of efficient organization and administration of the farm business.
4. To furnish farmers with standards of excellence in farming taken from farms in their own vicinity that will enable each of them to see by comparison the weakness of his own farm organization and the improvements required to secure desired results.

APPROPRIATIONS REQUESTED OF CONGRESS FOR THE FISCAL YEAR ENDING JUNE 30, 1921.

For the prosecution of the work of the Bureau of Farm Management and Farm Economics as outlined above the Congress is asked to appropriate the sum of \$611,990.

It is proposed to use approximately one-half of this amount in ascertaining the cost of producing the staple farm products. About one-fourth will be devoted to the study of land tenure and other land problems. The remainder will be used in carrying on work in farm organization, farm financial relations, farm labor, agricultural history and geography, and farm-life studies.

In asking for this limited sum of money, which is less than 10 cents per farm in the United States, it is recognized that it is not commensurate with the importance of the farm economic problems to be dealt with. It is planned to develop the work gradually on sound lines. In fixing upon the amount asked for expanding the work this year the number of men with proper training who can be secured at this time has been given primary consideration. With the funds requested it is believed that results can be secured such as will lead the Congress to desire further expansion as rapidly as men properly trained for doing satisfactory work in this field are available, to the end that in the course of a few years the Bureau of Farm Management and Farm Economics will be able to meet in an adequate way the demand for farm economic facts.

Dr. TAYLOR. I have brought down this morning a number of copies of the reports of the special committee on reorganization of the Office of Farm Management, so that in case members of this committee are interested they may have copies.

I would like to call your attention especially to the chart in the brief which I have distributed. You have here the figures on the cost of producing lint cotton, and I present this simply as a sample. You see, for the farms covered by the study, the cost of producing cotton in 1913 and in 1918. In the left-hand column you have the cents per pound of lint cotton, and in the right-hand column you will find the number of farmers who produced at these different

costs. For instance, you find in 1913 two of the farms studied produced at a cost of 5 cents a pound, four at 6 cents, but the great numbers were producing at 10, 11, 12, and up to 16 and 17 cents. In 1918 you will find that the costs were generally higher. There was one man producing at 11, one at 12, and seven or eight at 13; but when you get to 20 cents, between 20 and 30 cents, you find more than half of the cotton produced.

I bring this before you to show the wide range in costs and to call your attention to the fact that the average is perhaps not the important thing in cost studies, but getting the range of costs.

In the table at the bottom of this chart you will note the percentage of the cotton raised on the farms covered by the study that was produced below different costs. For instance, in 1913, 91 per cent was produced at 16 cents or below; 77 per cent was produced at 14 cents or below; 56 per cent was produced at 12 cents or below, and only 17 per cent of it produced at 10 cents or below, whereas in 1918 81 per cent of it was produced at 30 cents or below.

In the application of cost figures to the problem of a necessary price, these ranges need to be taken into account, and consideration needs to be given to the question of how high the price needs to be in order to secure the bulk of this product. Obviously, if the price equaled the average cost, all producing at a cost above the average would be producing at a loss; those producing below the average would be making a profit.

Mr. VOIGT. You do not show the average cost of production here, do you?

Dr. TAYLOR. I do not on this statement. In Table II are figures that show the averages. The real purpose, however, is to show the distribution of costs as between labor, fertilizer, ginning, use of land, overhead, etc. And there you see the average was 12.25 cents for 1913 and 23.9 cents for 1918. It is our opinion that the emphasis should not be upon the average but upon the range, and of course it is not to be expected that a price should be high enough to cover the costs of those men who are producing at an exceedingly high cost.

There is another very important use, of course, of figures of this kind, and the matter of first importance is that of farm organization. The men who are producing at high costs need to know the methods that are being used by the men producing at the lower costs. In other words, the cost of production statistics give the starting point for the study of better farm organization and better management of farms.

Mr. ANDERSON. Have you discussed, Dr. Taylor, the method pursued in arriving at these costs and figures?

Dr. TAYLOR. I have not. That can be discussed at this time if you desire to have me do so.

Mr. ANDERSON. Whenever you think best.

Dr. TAYLOR. The method we use when we have a single crop is a less expensive method than where we have a number of crops combined. It has not been the object in getting cost figures in cotton to get all of the information with regard to every activity on that farm, for the simple reason that it costs too much to get the material.

In 1913, over 80 per cent of the income on the farms studied came from cotton and so we concentrated upon getting the information for cotton by what is called the survey method. Each of the farms was visited and the man who was making the survey, with his blanks before him, asked questions and got together all the information with regard to the receipts and expenditures (the total receipts and expenditures) on that farm. Special studies of cotton are being made which will show the amount of labor that was put in on cotton, but it is not attempted to find out what the man was doing all the rest of his time; merely the time he spent on his cotton. A few of the elements, of course are looked into—the labor costs, the fertilizer costs, the ginning costs, and charges for use of the land.

MR. ANDERSON. May I ask you a question there without interfering with your plan of procedure?

DR. TAYLOR. Yes, at any time.

MR. ANDERSON. I take it from what you say that these figures are not arrived at from accounts kept by those people concurrently with the doing of the work, or the incurring of the expense?

DR. TAYLOR. No elaborate records. These are based upon the survey method. There are several methods that can be used in getting costs. We have found the cost of securing the figures on a farm vary greatly according to the method we use. What we want to do is to use a method that is sufficiently accurate for the particular subject involved. Now when we make a cost-accounting study in a region where there is a great diversity in the farm business, and there are three or four important, separate, enterprises, then we give more attention to detailed reports of the labor, so that we get a report of exactly what was done by each worker each day in the year, in order that the labor costs may be distributed to the different enterprises. Where, however, the major part of the labor is put upon one enterprise, we distribute the entire costs of the labor according to the receipts. In this particular case, I should explain that these figures for 1913 were dug up out of surveys that were made in Sumter County, Ga., for the year 1913 and the materials in the office were reworked with a view to getting them in this form. And they are based upon the survey method, which is not as accurate in every detail as the detailed cost-accounting method, which is in use at the present time on about 150 farms, more largely in the regions where farming is diversified.

MR. HUTCHINSON. Do you consider the production in your cost system at all? In other words, suppose I raised a bale of cotton to the acre in 1918 and in 1913 I only raised half a bale to the acre.

DR. TAYLOR. Yes. The variation in yield is one of the principal occasions of variation in cost per pound of lint.

MR. HUTCHINSON. That is what I supposed.

DR. TAYLOR. Yes. So that when you get the costs for one year on one farm you do not have what is necessarily the cost for the next year on that farm. There is not only a wide range from farm to farm but a wide range on a given farm from year to year.

MR. HUTCHINSON. You raised a great deal less cotton in 1918 than you did in 1913?

DR. TAYLOR. Mr. Peck, what are the comparative yields?

MR. PECK. It was slightly less on these farms for 1918 than for 1913—on the farms pictured here.

Mr. HUTCHINSON. Then you add your cost of fertilizer and labor to the cost of producing that cotton, do you not?

Dr. TAYLOR. The cost for fertilizer per unit of cotton would be greater in 1918 if they used as much fertilizer.

Mr. HUTCHINSON. I understand.

Dr. TAYLOR. But I think they did not use as much fertilizer.

Mr. HUTCHINSON. That is the reason for this lower production?

Dr. TAYLOR. It was, perhaps, one factor.

Mr. HUTCHINSON. It really depends on production how much you get for costs?

Dr. TAYLOR. Yes.

Mr. HUTCHINSON. My experience is that you will find one farmer is very successful and another one is not, and you must add that to the cost of production.

Dr. TAYLOR. Our effort is to portray the facts as they are, and that is what we are trying to do. We are not trying to find—we doubt if there is such a thing as the one cost of producing cotton. What we want to do is to portray the facts which will show there is a great diversity in costs of producing cotton and, taking that as a starting point, there are two or three important things to consider.

The one of first importance is farm organization, with a view to bringing up those farms with such high costs. And that is one of the major functions, as we look upon our work. Table I is a detailed table of these costs distributed on the basis of whether or not they were white owners or white renters, colored owners or colored renters, and you find the range of costs in both instances very similar.

In Table III we attempt to present what we call the basic requirements in producing cotton.

In studying the costs for 1918 on over 800 farms in 10 different areas in the Cotton Belt, the results of which are not yet available, we got at the number of man hours required, the number of horse hours required, the amount of fertilizer, manure, seed, sacks required, the charge for ginning, insurance, taxes, machinery, overhead, and the use of land. Having gotten those elements of costs, we are now getting the production for 1919. We got the acreage last spring and now we are getting the production per acre on those same farms. As soon as we get that material in we are able, on the basis of those facts, to figure the cost of this year's crop on those farms. Once we get this work started the amount of work each year is very much less.

Mr. ANDERSON. I dislike to interrupt you, but I would like to inquire while I have these things in my mind, if it does not disturb you—

Dr. TAYLOR. It does not disturb me at all.

Mr. ANDERSON. Do these studies indicate anything with reference to the relation of management to cost? I mean the relation of management to cost in its relation to production?

Dr. TAYLOR. There are certain things very clearly indicated in this Sumter County study, in comparing management in 1913 and 1918. One important change is that the percentage of the total income from cotton fell more than 10; that is, it was above 80 and it fell down to 70, or below 70. In the meantime, the velvet bean had come in and they were producing more hogs and better hogs. In other words, the educational campaign which had been going

on there for a more diversified type of farming was becoming effective, and that was clearly pictured in the comparison.

A study of this would, of course, take in specific cases. You take the farmers that have the high cost and those with low cost and you will find part of the difference is due to yield. Then the explanation of the difference in yield in part goes back to nature and in part to the character of the operations, the way in which the farming is carried on; for instance, a type of farming that keeps the soil in good condition as against the type of farming that reduces the soil and results in low yields.

Mr. ANDERSON. What I am getting at is whether these cost figures are sufficiently indicative to point out deficiencies of management which would, if corrected, result in greater production with smaller cost?

Dr. TAYLOR. That is exactly the thing they are intended to do. And as these reports are analyzed more and more carefully from year to year, the skill with which we are able to point out the deficiencies in the management and make suggestions with regard to better management is ever increasing. Of course, when we go into a given county and make a survey and find certain conditions, we feel we must be rather conservative about giving advice until we have studied the matter long enough to understand the whole situation.

Mr. ANDERSON. Then let me ask you this question: I take it from what you have said that there is at present no cost system developed which will give you exact data upon which you can determine the deficiencies of management and so forth. What you are seeking to do primarily, at first, is really to work out a system of cost accounting?

Dr. TAYLOR. That is the first and fundamental thing and the work this year has been in samples by different methods with a view to finding the methods that apply to particular types of farming. We do not expect when the best systems have been developed that the same system will be used for all types of farming.

We have just this fall started studies in the cost of fattening beef cattle. We have these started in five States. The method here is to go into a community and take a general farm survey of 100 farms which give the general view of the agriculture of that region. While taking that survey, we get detailed information regarding those farms. From this number 25 are picked out, on which they are going to feed two carloads of cattle or more, and, of course, keep hogs, during the winter; that is 25 farms are selected and a man is employed to make it his entire job to continually visit those 25 farms to keep the detailed facts up to date, so we will know exactly what has been fed to those cattle and the labor requirements on the cattle and all of the cost facts relating to the fattening of those cattle from the time the cattle are put in the feed lot and what they weighed when put in the feed lot, until they go on the scales and are sold.

Mr. LESHER. Have not some of the State colleges been doing that work?

Dr. TAYLOR. Yes.

Mr. LESHER. For years?

Dr. TAYLOR. Cornell, Minnesota, Wisconsin, and Illinois have been doing work of that kind for several years. Mr. Peck, who is

here this morning, who was at the University of Minnesota, and who for several years had charge of the detailed cost-accounting work there, and has published a very considerable amount of work—the best work, I think, that has been issued from any agricultural college on costs—has been brought to Washington to take charge of all these cost studies.

Mr. LESHER. Don't you think it can be studied better at these colleges than it can on the farm?

Dr. TAYLOR. You mean on the college farm?

Mr. LESHER. They can keep the costs, prices, and everything that enters into it?

Dr. TAYLOR. Of course, the costs at college farms are very abnormal for various reasons, because experimental work is in the foreground rather than production for profit. But that leads me to call your attention to the fact that in these cost studies, in accordance with the recommendations that were made to the Secretary last spring, the effort is to cooperate with the colleges as far as possible. And these beef-cost studies that are being carried on at the present time are in cooperation with the colleges on a 50-50 basis, so that the man who is doing the detail work is constantly in close touch and under the direction more or less of the man in charge of the farm-management work at the colleges. Thus there is no duplication of work, but a harmonious relationship between the Department of Agriculture and the colleges in carrying on this work.

We have exactly the same beef-cattle feeding project carried on in five States at the present time, which also involves the hog feeding, so that the results in those five States can be put together. The difficulty is, with the funds available we were not able to start this on an adequate scale, but we decided we would start in with a quality of work that would be satisfactory, with the hope that we would be able to expand it the second year. Furthermore, we feel it will be necessary to carry these beef studies through a period of five years in order to get adequate results.

Mr. TINCHER. Suppose you had had sufficient funds and had been able to know the exact cost of production of all meat products, say, for 1918—I wish you would put in the record just what advantage that would be; how you would use that information to advantage?

Dr. TAYLOR. That material would have great value from at least two points of view. From the standpoint of the general public, if we had adequate and satisfactory figures of cost, it is believed that there would be greater willingness for the farmer to receive a fair price for his product; from the standpoint of the farmer, that he would be more likely to get a fair price. And if he gets a fair price, he is happy to continue regularly in the business. So that from the standpoint of the farmer and consumer, it will run more evenly from year to year.

Mr. TINCHER. If you had had the exact cost of production of those products in 1917 and the public had had the full information, or had had it in 1918 even, and the public had been fully informed of the costs of producing all those articles, would not that have had a tendency to cause dissatisfaction with the farmer in 1919?

Dr. TAYLOR. On the ground that—

Mr. TINCHER. That the increased cost has been so much?

Dr. TAYLOR. Of course, the costs to the farmer have increased rapidly during the war period. Wages followed the prices up. The cost of raw material of various kinds followed up. So that the costs have been rising all of the time. Since you ask that question, I want to proceed to say, however, these cost studies have value not only from the standpoint of the relation of cost to price but also from the standpoint of the better organization of the farm, and each individual who is producing at a cost that classifies entirely too high has his attention at once called to the fact and it awakens him to the necessity of reducing his costs. And that is the starting point for the work of reorganization which is fundamental in the work of the Office of Farm Management.

Mr. McLAUGHLIN of Michigan. How is this called to their attention?

Dr. TAYLOR. In the case of the specific farms where the records are kept of course he gets the information for his farms of exactly what his costs are, and by having these records published he sees what other people's costs are.

Mr. McLAUGHLIN of Michigan. How long after they are taken is it before they are published?

Dr. TAYLOR. That depends upon a variety of circumstances.

Mr. McLAUGHLIN of Michigan. How long after they are taken are they published, I ask?

Dr. TAYLOR. I will say this, that the materials regarding the crop for 1919 are not all in in the office as yet. The basic factors of cotton costs are in the office, so that as soon as we get the yields on each of those farms we will have the material. Then, the amount of time that is required for tabulating means a few months, and I should say that by the 1st of March—is that too early, Mr. Peck?

Mr. PECK. No.

Dr. TAYLOR. By the 1st of March the cost statements for those 800 cotton farms will be ready for publication?

Mr. PECK. Yes, sir.

Dr. TAYLOR. That will be about the time he starts in on the production of his next year's crop.

Mr. ANDERSON. How many cost of production studies are being followed now; I mean what particular lines do you follow? You referred to cotton?

Dr. TAYLOR. Yes.

Mr. ANDERSON. And to beef production. Is there anything else?

Dr. TAYLOR. Sugar in Utah and Idaho; the cost figures on sugar. Then I mentioned the beef-cattle studies, and tobacco is one project which is in cooperation with the State of Kentucky, or about 150 farms. That is being carried on by the more detailed method, where a man continually visits those farms.

Mr. ANDERSON. You expect to extend those studies this coming year to other projects?

Dr. TAYLOR. The expectation is first to expand to an adequate basis the work that is already started. For instance, these beef studies we want to expand those to three units in each State, so that instead of 125 farms in five States we will have three times that many; that is, instead of 25 farms in each State, we will have 75 farms in each State. And the wheat studies are entirely inadequate at the present

time; we were unable to get records from more than 600 farms this year, which is entirely inadequate.

In addition to the expansion of the work that is started, the additional thing we want to do, one of the special things we want to do, is to get some new material on the cost of farm power. At the present time, as you know, there is a very great demand on the part of the farmers to know the relative costs of horse power and tractor power, and projects are being planned and the States are glad to cooperate in carrying on studies along that line.

Mr. ANDERSON. I would like to ask where the wheat studies are being conducted or will be conducted?

Dr. TAYLOR. The wheat studies are just in progress now for the 1919 crop. Can you name the States, Mr. Peck?

Mr. PECK. In the winter-wheat area, Kansas, Nebraska, and Missouri; in the spring-wheat area, Minnesota, North and South Dakota.

Mr. ANDERSON. What part of Minnesota?

Mr. PECK. I believe Clay and Traverse were the two counties.

Mr. McLAUGHLIN of Michigan. These units are 25 farms each in the beef studies?

Dr. TAYLOR. In the beef-cost studies, one man is looking after 25 farms.

Mr. McLAUGHLIN of Michigan. And you have a man for each unit?

Dr. TAYLOR. Yes; we have a man for each unit and we have just one unit in the State at the present time, and we would like to have three locations of that kind in each of those States.

Mr. McLAUGHLIN of Michigan. You were speaking of the cost of production of sugar.

Dr. TAYLOR. Yes.

Mr. McLAUGHLIN of Michigan. You are working in Utah and Idaho?

Dr. TAYLOR. Utah and Idaho this year.

Mr. McLAUGHLIN of Michigan. I presume the sugar manufacturers all operate in about the same way. They make a contract with the farmer to deliver his beets at so much a ton?

Dr. TAYLOR. Yes.

Mr. McLAUGHLIN of Michigan. Regardless of the cost of production to the farmer, beets cost the manufacturer of sugar just so much?

Dr. TAYLOR. Yes.

Mr. McLAUGHLIN of Michigan. And he must keep a very accurate account of the cost of production of sugar from the point of the purchase of the beets. What can you do in that line?

Dr. TAYLOR. What we do is to study the cost of production on the farm, so that the farmer may have some basis for determining whether or not he can produce beets at a price which the factory will offer.

Mr. McLAUGHLIN of Michigan. Can he not tell at the end of the year when he gets the money from the manufacturer whether he has made any money or not?

Dr. TAYLOR. If he is producing beets and nothing else, it is a relatively easy matter for him to know whether he has made any money or not; but if he is producing beets as one crop in combination with a large number of other crops he can not tell whether he has made or lost money on any one particular enterprise without the cost studies.

Mr. McLAUGHLIN of Michigan. What are the manufacturers paying the farmers in Utah for their beets?

Dr. TAYLOR. I believe \$10.50 was the basic price. I have not seen their contracts. They probably get \$1 a ton for every cent sugar sells for above 9 cents. That is the way the contracts are drawn in Wisconsin; so that the price varies with the price the factory gets for the sugar.

The CHAIRMAN. How are those prices arrived at?

Dr. TAYLOR. The price was offered by the factory.

The CHAIRMAN. Is it some agency of the Government in Washington?

Mr. McLAUGHLIN of Michigan. It is a matter of contract?

Dr. TAYLOR. It is a matter of contract.

The CHAIRMAN. The Government does not exercise any authority over the matter?

Dr. TAYLOR. Not as I understand it.

The CHAIRMAN. It has not for the current year?

Dr. TAYLOR. As I understand, there is no control over that; it is simply a private contract.

The CHAIRMAN. Do you know what the increase in price made to the farmers for beets has been during a series of years?

Dr. TAYLOR. Beets were produced in Wisconsin for \$4.50 a ton before the war.

The CHAIRMAN. The contract price between the farmers and the manufacturers has not been as low as that for a long time.

Dr. TAYLOR. It has gone from \$4.50 up to \$6, and then it jumped to \$10.

The CHAIRMAN. How long ago was it \$4.50?

Dr. TAYLOR. That is 10 years or so ago. I grew a crop of beets in 1917 and I got \$6 a ton that year. The crop was grown by a share man on my farm this year—

The CHAIRMAN. Was that on the basis of the sugar content?

Dr. TAYLOR. Without regard to the sugar content. The factory furnished the seed and charged for it, of course, so that they, in a way, controlled the kind of beets that were being grown, and it was without regard to the sugar content.

The CHAIRMAN. Were all contracts the same as that?

Dr. TAYLOR. Probably not.

The CHAIRMAN. I supposed there was an increased price paid to the farmer depending on the percentage of sugar in the beets?

Dr. TAYLOR. That was tried in Wisconsin, and the farmers found a great deal of difficulty in getting a satisfactory test as to the sugar content of the individual crops. And so in that case they went back to paying on the basis of the net weight per ton without regard to the sugar content.

The CHAIRMAN. And then an increase of so much per ton as the price of sugar in the market increases?

Dr. TAYLOR. Yes; that is in the contract for this year.

Mr. VOIGT. When you find a farmer whose cost is excessive in producing cotton, wheat, or some other crop do you go back to him and try to show him what the cause is?

Dr. TAYLOR. That is exactly the idea, through the farm management and demonstration work, through the States relation service which is cooperating with the office of farm management. The man

who is in charge of farm management demonstrators has his office on the same floor with mine and is closely connected with the Office of Farm Management, makes it his business to keep in close touch through the county agents and with the farmers throughout the country and to get them to keep accounts themselves. Ultimately this job will be completed when every farmer has been taught to keep his own accounts and see where his difficulties are, but that will take a very great deal of time.

Mr. VOIGT. Do you go back to the individual farmers on whose farms you have kept account of the cost of producing a given crop?

Dr. TAYLOR. We send the result of his figures back to him. The research workers do not make it a special business to go back and talk with each one of those men. That is the demonstration phase of the work.

Mr. VOIGT. Have you any knowledge whether the individual farmers who produce at too high a cost are visited or written to by someone and the cause pointed out to them why the cost is too high?

Dr. TAYLOR. The analysis of these results is sent back to each one of those farmers. But when it comes to visiting each one of those farms, our attempt is to get back to them through the farm-management demonstrators and the county agents, who are the personal contact men. And I wish to say that the special work of the farm-management demonstrators is to stimulate, at the present time and has been for several years, accounting on the part of the farmers so that they may know what they are doing and in each case to point out to them the way in which they are falling down. It is obvious, however, with several million farmers in the United States, it is only individuals here and there who can be touched by people in the Washington office. But through cooperation with the State organizations and the county agents, it is possible to touch more and more of the head men who, in turn, touch their neighbors.

Mr. VOIGT. Say, for instance, in 1918 you found that there were a number of farmers whom it costs 30 cents a pound to produce cotton.

Dr. TAYLOR. Yes, sir.

Mr. VOIGT. Do those men who produced that 30-cents-a-pound cotton find out through you, or from you, that you have figured out that it cost them 30 cents, and do you tell them where the difficulty is?

Dr. TAYLOR. That is our effort; yes. Of course, I have been with the office only since the 1st of April so I do not know what was done with regard to these particular men. I wish to say we reworked the material that was in the office, went back to the original records that were taken, in order to get the material in this form. I think it was figured on terms of average in the first instance, instead of showing the range in costs by individuals.

Mr. HEFLIN. I know a farmer in my county who produced 50 bales of cotton in 1918; this year the same farmer produced 35 bales. It cost him more to produce 35 bales this year than it did to produce 50 bales last year.

Dr. TAYLOR. Very probably. Now, with the materials we have collected—

Mr. HEFLIN. The boll weevil is in this section I am talking about.

Dr. TAYLOR. Yes. That is a factor in the cost per unit of production.

Mr. PECK. I just want to state that, when a study like this is completed, each farmer receives a detailed statement of his own business, with a letter pointing out certain factors that appear to make that cost higher than the cost that his neighbors have.

Mr. VOIGT. That is what I am trying to get at.

Mr. PECK. Yes; each man gets a statement.

Dr. TAYLOR. He gets it—not simply him own, but the ranges of the others also.

Mr. PECK. The comparison of his farm business with the others.

The CHAIRMAN. And the variation is due to the elements, the cotton boll weevil—

Dr. TAYLOR. Yes; the cotton boll weevil.

The CHAIRMAN. Not altogether to the man himself?

Dr. TAYLOR. No.

The CHAIRMAN. Would you be able to give advice for overcoming difficulties caused by the elements?

Dr. TAYLOR. Advice with regard to the whole problem of growing cotton, of course, is not attempted by the Office of Farm Management.

The CHAIRMAN. In line with the case cited by Mr. Heflin, in my section of the country last year we produced about 20 bushels of wheat to the acre; this year probably 8 to 10, less than half of what we produced last year. It cost practically as much to produce 8 bushels as it did to produce the 20, and we got just as much for the 8 bushels, per bushel, as we did for the 20 last year. Hence the cost this year is much more than it was a year ago. The cotton-boll weevil and all elements enter into it.

Dr. TAYLOR. Yes. Now, the purpose of getting cost figures is to get all the facts of cost and to lay them clearly before our minds in order that we may better judge what to do.

The CHAIRMAN. I am sorry to add that we have had such attacks for 40 years in my section of the country. We have had the black rust. The object is to know how to deal with it.

Dr. TAYLOR. The Office of Farm Management does not deal with those phases of the problems. Those questions of plant pathology and entomology, etc., are dealt with by the various bureaus having charge of those specific problems. Our problems relate primarily to the questions of farm organization and farm finance and the economic problems of organization. Even in a given year, with given conditions to meet, some farmers do very much better than others.

The CHAIRMAN. Under the same conditions?

Dr. TAYLOR. Under the same conditions. And the hope is to bring those who are lagging behind up to a higher level and then to enable those who are in the lead to see more clearly how to adjust themselves to market conditions, labor conditions, and all sorts of conditions in order to produce at a lower cost and get a larger margin of profit.

Mr. McLAUGHLIN of Michigan. How many people are employed in the field—the entire number—in this line of work?

Dr. TAYLOR. I will ask Mr. Peck to answer that question; that is a line of work of which he is in immediate charge.

Mr. PECK. Counting the cooperative work of the States where the States contribute 50 per cent of the cost of conducting the investigations, this past year, roughly—

Mr. McLAUGHLIN of Michigan. Have you not the exact number?

Mr. PECK. Our maximum has been 30; that is, there were different numbers employed at different times. This work was started in the spring. At one time we had 11 scientific men on the cotton study, and four went from there to the wheat study. There may be three or four weeks on one of those studies where the State men have come out and helped us to take the records; so it is rather hard to say the exact number carried through the season. I would say 30 would be the greatest number at one time employed on all the cost studies we are making.

Mr. McLAUGHLIN of Michigan. How many are employed in Washington?

Mr. PECK. The total number of the whole force in the cost of production and farm organization section is 58. That counts the scientific men, clerks, and stenographers that are on these particular projects.

Mr. McLAUGHLIN of Michigan. It takes 58, then, to tabulate the work done by 11 or 30?

Mr. PECK. No; the 58 includes all the people who have been employed in these sections. That counts in the scientific men, it counts in these men I have given you as 30 at various times. We have 17 straight clerks and typists, and we have a man in charge of the crop work, a man in charge of the live-stock work, and a man in charge of the farm-power investigations. We have 17 straight clerks who do nothing else but tabulate the field records, and then there are certain times of the year when the men in the field do part of the tabulating and summarizing and preparing the data for publication.

Mr. McLAUGHLIN of Michigan. It takes 58 employees, officers, and so on, in Washington to tabulate the work of 30 in the field?

Mr. RUBEX. I understood him to say those 30 were included in the 58.

Mr. PECK. Yes.

Mr. McLAUGHLIN of Michigan. I did not get that—

Mr. RUBEX. Let us see whether he means that or not?

Mr. PECK. Part of these 30, the 30 employed here the year round, whose whole salaries are paid out of our funds, are included in the 58. They are only in the field part of the time; we do not have men in the field the year round.

Mr. TINCHER. How many do you have that do not go in the field, who stay here?

Mr. PECK. These include the 17 clerks who do not go in the field, and there are perhaps only two or three besides those who do not go in the field.

Mr. TINCHER. Out of the 58 there would be 20 that do not go in the field?

Mr. PECK. Yes; I would say that. I believe the number is tabulated in the printed report.

The CHAIRMAN. You are asking for an increase of appropriation. The appropriation for last year was \$302,590 and this year you estimate \$611,990.

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. An increase of \$309,400. How many people will be employed next year?

Dr. TAYLOR. The major part of that is for extension of the cost of production and farm organization work.

The CHAIRMAN. Will you state just the number to be employed next year while you are on that?

Dr. TAYLOR. I have in my hand the way in which it is planned to distribute these funds next year. To live stock cost studies, which will include the beef cattle in the Corn Belt, that is the fattening of cattle, some studies on the range, and the sheep and wool studies, \$50,000; cotton cost studies, \$20,000; wheat cost studies, \$20,000; milk cost studies, \$25,000; sugar costs, \$10,000; fruit costs, \$15,000; tobacco costs, \$5,000; farm power studies, \$50,000. And the detailed cost studies which will be made in this region—

The CHAIRMAN. How much for farm power?

Dr. TAYLOR. \$50,000. And for the detailed cost accounting, where the farm is of a mixed nature and we can not get at the cost of one separate thing so well, the work we have called detail cost studies, \$50,000. That accounts for \$245,000 to be expended in these cost studies.

Mr. ANDERSON. Are you now engaged upon studies on this milk proposition?

Dr. TAYLOR. We have no studies in milk, excepting some cooperative studies just being started.

Mr. ANDERSON. How about fruit?

Dr. TAYLOR. The cost of fruit in New York has been studied to some extent this last year.

Mr. ANDERSON. Have you started the farm-power project?

Dr. TAYLOR. The farm-power project has not been started; it is just planned. There was a conference held in Chicago in the fall, and it was urged by all classes interested in the farm-power question that cost studies be made as a basis of comparing relative profitability of using different forms of power.

Mr. ANDERSON. These detailed cost projects are now under way?

Dr. TAYLOR. They are now under way in three States in cooperation with the colleges. About 150 farms are being covered by that method at the present time. Those are usually on a 50-50 basis.

Mr. RUBEY. Do you expect to take up each one of these projects and tell us what you are going to do under each?

Dr. TAYLOR. I am glad to have questions.

Mr. RUBEY. I would like very much to have you tell us what you expect to do under the farm-power proposition, whether or not, in connection with that, you are going to take up the question of water power on the farm or just simply motor power?

Dr. TAYLOR. The major problem is the pulling of machinery—that is, the major thing is to know this, to what extent is it going to pay the farmer to dispose of his horses and get a tractor. That is a thing that millions of dollars are being expended for at the present time, and we want to give the information that will enable this new move to be taken along intelligent lines.

Mr. McLAUGHLIN of Michigan. Where you are carrying on these different lines of work in the States, you have experts in each line, do you?

Dr. TAYLOR. Yes. Of course the same man may be working on one line of costs a part of the time and on another line part of the

time; that is, the detail man. We have one man, for instance, who specializes on the cost of producing these crops which are special crops, like cotton, sugar beets, and so forth, where a method can be used that requires less detail than where you have to get all of the information from the whole farm. And now on the farm power studies the aim will be this, to get enough records from specific farms to show the kind of power that is needed at different times of the year, what percentage of the power is used in drawing wagons, what percentage in harrowing, cultivating corn, plowing, or disking, and at what time of the year is this demanded. Then our aim is to see how much of this can be undertaken by a tractor, for instance, rather than by horses; which it is physically possible to do. Some of this work can be done by horses and not well by tractors; other parts of the work can be done by tractors. Then if we find, for instance, a part of the work can be done by tractors a certain part of the year and all of the horses have to be kept in order to provide power at another time of the year, so that the farmer can not reduce the number of horses by keeping a tractor, it is obvious the total cost of power on the farm would be increased by getting a tractor.

The object is to make such a study as will show how the power required on the farm can be secured at a reduced cost.

Mr. TINCHER. Have you had any appropriation before for the farm power project?

Dr. TAYLOR. There has been no appropriation for farm power.

Mr. TINCHER. Don't you think a good safe way would be for the Department of Agriculture to simply issue a statement to the farmers that the best power so far, the most reliable and durable power, is the mule, and then let the machine companies that are pushing tractors advance their interests (and they will do that quick enough, or too quick in most instances); for us just to stand for the mule and save this \$50,000 until there have been further developments?

Dr. TAYLOR. Is it not entirely probable that by saving that \$50,000 we are asking for farm power studies you will leave it entirely to the manufacturers of tractors who have but one interest (and that is to sell their tractors), to give the information to the farmer, instead of the department providing it for the farmer?

Mr. TINCHER. My idea was to take a definite stand, without spending \$50,000, and to advise the farmer to stick to the mule and just save \$50,000; say to him "You stick to your mule," and then let them press their claim. We can do that without spending any money.

Dr. TAYLOR. Then, in turn, the manufacturers will say we have made the statement without any investigation whatever, and they will be in a position—

Mr. TINCHER. You tell them you have made an investigation, that you talked to one of the members of the Committee on Agriculture who knew something about it, and he was willing to take the responsibility of advising them to stick to the mule and save money. [Laughter.]

Mr. RUBEY. You might state, in that connection, that the gentleman had talked with Mr. Tincher of Kansas. [Laughter.]

Dr. TAYLOR. I have no doubt but that the gentleman knows exactly what to do on his own farm—

Mr. RUBEY. We from Missouri, of course, are with the mule. At the same time we realize that a great deal of this work can be done better by tractor power in that State than it can be done by the mule.

Mr. McLAUGHLIN of Michigan. In how many cases do you use the same man for different kinds of work? You have a wheat investigation and a feeding investigation, and a beef investigation——

Dr. TAYLOR. I will ask Mr. Peck to answer that question, since he is in immediate charge.

Mr. PECK. We are attempting to build up a corps of experts who can meet various problems. I do not care to have a man just on wheat and one on cotton and one on cattle and one on hogs, because it is not conducive to efficiency. The same man may be the cotton man this year, and then part of the time he may be on wheat and also on sugar beets.

Mr. McLAUGHLIN of Michigan. Those sections of the country where those three products are raised are widely separated.

Mr. PECK. Yes.

Mr. McLAUGHLIN of Michigan. A man can not be doing all those things at the same time.

Mr. PECK. Exactly.

Mr. McLAUGHLIN of Michigan. But in a beet-producing State, a wheat-growing State, and a corn-growing State those activities are all carried on at the same time by the same farmer.

Mr. PECK. In the survey method we have to visit the farm immediately after the end of the year to take the previous year's record; that is under the survey method. In the detailed accounting method we have to have a man in the State all the time to visit those farms regularly. That is the difference. But one can make a wheat study by the survey method and spend two or three months making that study.

Mr. McLAUGHLIN of Michigan. Is that man while engaged those two or three months doing anything else?

Mr. PECK. No; he gets the cost of growing wheat and its relation to the whole farm business on the wheat farm; that is all he does.

Mr. McLAUGHLIN of Michigan. And somebody else gets the data on the same farm for the production of beets?

Mr. PECK. No; on the special crops we pick out farms that are specializing on that product. On the big wheat farms we do not study beef, for example.

Mr. McLAUGHLIN of Michigan. Beef, however, is produced in connected with the corn farms?

Mr. PECK. Yes; perhaps as a secondary consideration to the corn production. That is another proposition. If we were to study corn, we probably could combine the studies very well; that is, the man who visited the farm right along on the beef could get the facts as to corn. But these special crops like sugar beets, cotton, and wheat are studied on farms that specialize; that have a larger percentage of their receipts from that crop than any other enterprise.

Mr. LESHER. You get the data from the farmer—the man on that farm?

Mr. PECK. Yes. We take the same man, as I say, who makes the cotton study during three months of the period and send him immediately from cotton to wheat to take the wheat records from the wheat farmers.

Mr. McLAUGHLIN of Michigan. There are many farms, in the aggregate a very large number, that are specializing in wheat?

Mr. PECK. Yes.

Mr. McLAUGHLIN of Michigan. But, unfortunately, a larger number are engaged in general farming, growing wheat, growing corn, fattening stock, and engaged to a more or less extent in producing milk.

Mr. PECK. Yes.

Mr. McLAUGHLIN of Michigan. Do you have different men for those different lines of study?

Mr. PECK. For the mixed types of farming you mention, that is, where we establish our cost-accounting studies, or cost-accounting routes, in cooperation with the State, we have a man who lives entirely with the farmers for the entire year and keeps the detail records on all the various products. That is the distinction to be made between the survey and the detailed cost-accounting method of investigation. Detailed cost accounting is where we have the reports kept by the farmer and the statistician, or route man, the year round.

Mr. McLAUGHLIN of Michigan. I am very glad you have found a man who can do two things. The difficulty hitherto has been that we have had to have an expert for each particular line of work.

Mr. PECK. That would be a mistake in our line of investigational work.

Mr. JACOWAY. Have you men in the department who are experts on the growing and culture of wheat and beets and on cotton also?

Mr. PECK. Yes; in the separate bureaus we have men on the cultural growing of those crops.

Mr. JACOWAY. Does any one man in your department understand all of those different items?

Mr. PECK. I would not want to say—

Mr. McLAUGHLIN of Michigan. This man does not instruct as to how to best grow those crops; he just takes the actual cost of production, regardless of how the work was done; he ascertains how much it costs.

Mr. PECK. Ours is just the accounting work.

Mr. McLAUGHLIN of Michigan. Then they have another man to teach the farmer how to grow corn, and another man to teach him how to grow potatoes, and another man to teach him how to grow wheat; but no one of your men can do two kinds of work?

The CHAIRMAN. Have you in mind investigating and ascertaining the relative merit of every make of tractor so as to advise what tractor to buy by testing out each make?

Dr. TAYLOR. Our idea is not to make a special study with regard to each tractor, but to study the power demands of the farm at the different times of the year for different kinds of work, to see to what extent a tractor that operates successfully could displace horse labor. And then the next question is to find how much more or less it costs to perform that work by the tractor or by the additional horses that would have to be kept. That is the specific advantages that we see in order that we may answer the question under what conditions will it pay a farmer to get a tractor, if he can get a good one and knows how to operate it.

The CHAIRMAN. But, in your opinion, is there not as much variation in the value of the tractor as there is in the value of the crop?

Dr. TAYLOR. Exactly.

The CHAIRMAN. One type may last 30 days and another may last for a season?

Dr. TAYLOR. It is not our intention to make a study of the different types of construction of tractors.

The CHAIRMAN. What value will the information be unless you can advise as to what tractors will do?

Dr. TAYLOR. There are other sections of the Department of Agriculture that deal with the tractor from the standpoint of construction.

The CHAIRMAN. I am afraid we would be charged with duplicating this line of work. What I want to get at is the line of study you pursue.

Dr. TAYLOR. It is the cost aspect of it, the way it fits in to the whole farm organization, that we expect to deal with. What we propose to do under this project will not duplicate in any way the work of any other branch of the department.

The CHAIRMAN. Have you made any investigation as to the advisability of substituting tractors for the mule, as suggested by Mr. Tincher?

Dr. TAYLOR. The Department of Agriculture has not carried on any investigations in that line.

The CHAIRMAN. I understood investigations were made and reports issued.

Dr. TAYLOR. From the detail cost studies that have been made in Wisconsin, Illinois, and Iowa through a series of years past (a few detail cost accounts have been kept on a few farms), it is possible at the present time to analyze the labor demands, because they kept the demand for horse labor each day in the year right through and showed what those horses were doing, and then we are able to answer the question, "Can that work be done by a tractor?" And by studying those reports we got a notion of the general way in which the matter can be studied if we had the up-to-date facts. But none of those studies at the present time, the ones that were made in the past, answer the question, nor were they intended to answer the question, with regard to the relative cost of power by the tractor and by the horse.

Mr. TINCHER. Seriously speaking, do you not think it would be a safe policy for the Department of Agriculture to advise against the purchase of tractors? Don't you think there are 10 tractors purchased where there ought to be 1, and don't you know and realize that the trouble the farmer is having now is paying his tractor bills? That is the situation not only in one section of the country, but in all the United States.

Dr. TAYLOR. Our desire is to be open-minded on this question and to make it our business to get the facts and lay them before the public rather than to go into the investigation with our conclusions already drawn.

The CHAIRMAN. Is it not a settled fact that the tractor is impracticable on the small farm, although it may be practicable to use it on the larger farm?

Dr. TAYLOR. I think such statements have been issued by different agricultural colleges that would indicate that the farm must have magnitude enough to give scope for the tractor.

The CHAIRMAN. There can be no question about that.

Dr. TAYLOR. Yes; there can be no question about that.

The CHAIRMAN. You can not farm with a tractor alone. You must have horses with the tractor; and if one has a small farm that can be operated with two or four horses, it would be useless to go to the expense of buying a tractor and allowing the horses to remain idle, would it not?

Dr. TAYLOR. Yes.

Mr. JACOWAY. Doctor, does your statement show how many acres were planted in cotton in the South last year?

Dr. TAYLOR. The Office of Farm Management collects no material on that point, and that is not presented here.

Mr. JACOWAY. You can get that, can you not?

Dr. TAYLOR. From the Bureau of Crop Estimates; yes.

Mr. JACOWAY. If I remember correctly, it was about 50,000,000 acres. Does your testimony show how many bales of cotton were raised from 50,000,000 acres?

Dr. TAYLOR. No, sir.

Mr. HARRISON. Information of that sort will come from the Bureau of Crop Estimates.

Mr. CANDLER. This division does not do that kind of work.

Mr. JACOWAY. Where a farmer has four children who help him to raise his cotton, do you take into consideration the labor of the children and the wife in estimating the overhead to produce a pound of cotton?

Dr. TAYLOR. Oh, yes; and we enter it in at what it would have cost to have hired that labor done.

Mr. JACOWAY. Do you put in the living expenses?

Dr. TAYLOR. Whatever this labor would have cost if it had been hired, which would include living expenses.

The CHAIRMAN. Your investigation is carried along on the same lines as it was carried on in Dane County, with, I believe, 60 farmers?

Dr. TAYLOR. Yes.

The CHAIRMAN. Was that work in Wisconsin carried on by you?

Dr. TAYLOR. Yes; that was under my direction.

The CHAIRMAN. It was conducted along the same line?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. You propose to continue along the same line?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. How much of this variation of cost is due to poor management and the things that you hope to overcome or advise against?

Dr. TAYLOR. That is a question it is impossible to answer. But when you have in a given community given conditions—that is, the weather conditions are the same and the animal pests and the plant diseases are the same on both farms—and you find a wide difference of cost, I would be disposed to credit most of the difference in cost to the difference in the man, not all due to the management of the particular year but through a series of years. Good farming is

cumulative. A good farmer is ever bringing his farm to a higher standard of culture, so that his crops are ever better and his live stock is ever better, so that he is gradually coming to this higher plane. A man who is on the lower plane can not jump at once to the higher plane, but we can point him the direction to take in order to gradually rise to that higher plane.

The CHAIRMAN. I think it would be of great service to furnish advice as to the methods of farming; but, of course, as to these other matters, as to the elements, that would be impossible.

Dr. TAYLOR. We would not attempt to give advice as to that.

The CHAIRMAN. Do you make a study of the soil?

Dr. TAYLOR. No, sir.

The CHAIRMAN. Would you make suggestions as to how to treat the soil?

Dr. TAYLOR. No, sir; we would leave that to the specialists on the problems of the soil. Our special problem is that of adjusting the farm organization and farm management in such a manner as to reduce costs and increase profits.

The CHAIRMAN. You would suggest the use of fertilizer, would you not?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. The amount to be used, the heavy spread or the light spread, and what kind to use?

Dr. TAYLOR. In the first instance, I would say that that is a study for the specialist on soils rather than the Office of Farm Management, although where men are using fertilizer in different ways we get at the difference in cost per unit of product resulting from those frequent applications of fertilizer, but any special study as to the relative amount of fertilizer, etc., is primarily a question for the Bureau of Plant Industry and the Bureau of Soils to make.

Mr. CANDLER. The object of your work, as I understand it, is to determine the cost of management on the farm, to find where the difficulty is and where the losses occur and advise the farmer in reference to that, so as to remove as far as possible all the difficulties and get him as near perfection as possible in the management of the farm in order that he may secure the greatest results from the work he does.

Dr. TAYLOR. Exactly. In the first place, what crops to grow and the proportions between the different crops. If, for instance, you have corn, oats, and clover, in order that you may have a continuous demand for labor—

The CHAIRMAN. You can give the results for one year, but next year it may depend upon the elements. Suppose you should find that an oat crop was more profitable than corn this year, you would not advise the farmer to plant oats next year just on the strength of that?

Dr. TAYLOR. Three crops like corn, oats, and clover fit together and require labor at different times of the year. You can start in with seeding oats and put in your oat crop, and then put in your corn crop and cultivate it, harvest your oats, and then comes the corn harvest, so that you have work throughout the year. Even if your oats are not as profitable as your corn, the thing you want to know is whether or not there is anything you can put in the place of oats that will pay better.

In the State of Wisconsin we have the choice between oats, barley, and spring wheat, and we want to know which of those three to grow. What we have found out practically is that one year and another we practically eliminate wheat, but we do not eliminate oats or barley. We put oats on our lighter land and barley on our richer land, because oats go down so badly on the richer land, and in that way the barley pays better on the richer land and oats pays better on the poorer land, so we combine the two and produce about the same acreage of the two as we would of either one if one paid better than the other.

In other words, it is a problem to get those facts which enable us to fit the parts of a farm work together in right balance.

The CHAIRMAN. But the price of barley changes. Barley may be worth \$2 one year and \$1 the next year. I have often sold barley for less than 50 cents.

Dr. TAYLOR. That is entirely true, that in any given year we lay our plans for the year on the basis of what we think will probably be the price.

The CHAIRMAN. But it is based on the yield and does not take into consideration the fluctuation in price?

Dr. TAYLOR. What the probable price will be, and keeping in mind what the probable yield will be as a basis for comparing the relative profit on oats and barley, for instance. On one particular piece of land I have in mind, for instance, I could not hope for more than 25 or 30 bushels of barley to the acre, whereas I might hope for twice the production in bushels of oats. On that particular piece I put in oats with the price in mind that I will probably get. On the other piece of land, if I put it in oats I would expect the oats to go down and not expect it to fill. I would have a great deal of difficulty in harvesting it, and my operating expense would run high, and my yield would be down, whereas with barley, the expense would be down and the yield higher, and at the price barley would probably pay better.

Mr. HUTCHINSON. Do you work with the farm agent? Is that a part of the farm agent's work or activity?

Dr. TAYLOR. The county agent, yes; and also our office man in charge of farm management demonstrators, through whom we keep in touch with the farm management demonstrator, who is in touch with the county agents, which is one of the routes through which we attempt to get the results of this research work out to the farmer.

The CHAIRMAN. I take it they could assist you in research work also, as far as the bookkeeping and some of the other things. Some things could be done by the county agent, could they not?

Dr. TAYLOR. They stimulate the farmers in keeping records, but, of course, they are very busy men. Through that method all farmers are stimulated in keeping records, and this helps the research men to get specific results when they go out for them.

The CHAIRMAN. It is largely a matter of bookkeeping, is it not?

Dr. TAYLOR. Largely a matter of keeping the records of what is done, and what it costs to do it.

The CHAIRMAN. What would you say to the dairyman that would be of value to him?

Dr. TAYLOR. On a dairy farm the farmer is probably producing his feeds largely, is he not, and where detailed records are kept on a

dairy farm, we keep the records of the cost of different kinds of feeds, so he knows whether it pays better to produce his concentrates or buy his concentrates, which is one thing he wants to know.

Another thing is in regard to the method of handling his cows, whether he should handle them in the barn the year around, or run them on pasture a part of the year and in the barn a part of the year. Of course, the amount of labor involved in keeping cattle in the barn the year around and feeding them silage and hay is very much greater than to keep them on the pasture. The yields may be higher, taking the summer through, but his costs are greater. What we want to do is to get at those elements of cost, so he can figure on these two different methods of work and know how much more his profit is going to be if he uses one method or the other, so he can decide what to do.

Accounting is of value as it points toward what to do in the future.

The CHAIRMAN. You speak of labor. You have reference to milking machines in the dairies?

Dr. TAYLOR. I have reference to the human labor, the power required in the fields, the horsepower, etc., and also the question, of course, of the relative cost of getting this work done by power methods and by hand methods, and, of course, the problem of the—

Mr. HUTCHINSON. It is not your intention to keep a man on the place all the time? Your officer is going to depend largely on the farmer?

Dr. TAYLOR. We will depend largely on the farmer. We will have one man who will look after, say, 25 farms, and he will continually visit these farms and help them to keep these records up in detail so that they can be tabulated, and we will get the results from them.

Mr. TINCHER. Would it be practical to get the records from the different county agents?

Dr. TAYLOR. No; because these county agents are so busy doing various other work that they have not the time to do it.

Mr. TINCHER. That is the very point we are getting at. I talked with several county agents while I was away, and they were not overbusy, most of them. A great many of them would be glad to furnish the reports, if you went to them.

Dr. TAYLOR. We can give plenty of work to any of them who are not busy and would be glad to get their cooperation.

May I just give a few words regarding the remainder of my statement on this question of farm financial relations?

The CHAIRMAN. Would you prefer to finish your statement and have questions asked later?

Dr. TAYLOR. If that is satisfactory; it is all the same to me. With regard to farm financial relations, the work that is being done this year relates primarily to insurance, farmers' insurance companies. There is one man and two or three clerks who have been working on that during the year. The supervision of this work was transferred to the office of Farm Management from the Bureau of Markets by the Secretary at the beginning of the fiscal year. In addition to that, the financial problem of farmers, telephone companies and the financial problem of farm credit has come up, and it is desired to give special attention to the question of the forms of farm credit, and especially personal credit.

You will remember when that matter came before the Congressional committee last year, the question was raised as to whether or not this work should be done by the Federal Farm Loan Board instead of the Department of Agriculture, and no appropriations were made for the current year for the study of forms of credit. As a matter of fact, however, the Federal Farm Loan Board does not contemplate investigations in this field, and for that reason we would like to devote some attention to farm credit in our studies during the coming year.

Farm credit is especially closely connected with problems of farm organization on the one hand and the problem of farm tenure on the other.

Anticipating the probable raising of the question of whether or not the Farm Loan Board wished to do work in this field, the Secretary, at my suggestion, addressed a letter to Mr. Norris, and received the following reply:

TREASURY DEPARTMENT,
FEDERAL FARM LOAN BUREAU,
Washington, November 29, 1919.

HON. D. F. HOUSTON,
Secretary of Agriculture.

MY DEAR MR. SECRETARY: I beg to acknowledge the receipt of your letter of the 25th instant in reference to the investigation of the general subject of rural credits. I have discussed the matter with my colleagues, and we are unanimously of the opinion that studies on this subject should be conducted by the Department of Agriculture rather than by this board. We have no appropriation available for the purpose, and if we were to undertake the work it would be necessary for us to build up an organization of experts which would, in a measure, duplicate the work of the Office of Farm Management.

I presume that with this expression of opinion from this board you will include in your estimates for the fiscal year 1921 the provision of funds for the prosecution of the farm finance project and will be in a position to assure a congressional committee that this appropriation will not duplicate any work which is being done or is to be done by this board. If you think it desirable, however, that there should be any further conference between us, I need not assure you that we are at your service at any time. I am,

Very truly, yours,

GEO. W. NORRIS,
Farm Loan Commissioner.

MR. JACOWAY. Have you made any investigation as to whether or not the individual farmer is satisfied with the Farm Loan Board system of getting money from the Federal Government?

DR. TAYLOR. I have not.

MR. JACOWAY. I understand that they are complaining of the red tape they have got to go through with. They state that they have to answer 266 questions, first, last, and all the time, from the time they make application up until they get the money. Have you had any discussion of that with the farmers in your investigations?

DR. TAYLOR. As I say, we have had no funds for investigating the credit question this year, but we wish especially to investigate the farm credit question from the standpoint of getting credit suited to the needs of the farmer.

MR. ANDERSON. What is the character of the work which you do on cooperative insurance?

DR. TAYLOR. In cooperative insurance a study of the different forms of farmers' cooperative insurance companies has been made. Some of the insurance companies represent very small areas; others

represent larger areas, and Mr. Valgren, who is in charge of this work, has through a series of years been making a very careful study of the success of the different types of cooperative insurance companies, and he has also studied their methods of keeping records and the type of organization, so he is in position at the present moment to give valuable advice to the companies.

Mr. McLAUGHLIN of Michigan. Advice to the companies?

Dr. TAYLOR. Yes; the cooperative companies, these farmers' companies. Sometimes they are county organizations, sometimes they are just township organizations, and sometimes two or three townships in a mutual fire insurance company, for instance, and he is able to give them advice that is very helpful in getting them organized on the proper basis. Only a small amount of the fund has been put into that, but the letters we have received from the different parts of the country with regard to the value of the service that has been rendered in connection with improving these cooperative insurance companies are very reassuring.

On the question of farm labor—

Mr. HUTCHISON. Before you leave the banks, I understood you to say you wanted to investigate the matter of loan credits to the farmers?

Dr. TAYLOR. Yes.

Mr. HUTCHISON. Do you think the department here in Washington can tell better than the local bankers or local people around whether a man is entitled to credit or not?

Dr. TAYLOR. No. I wish to state that we believe the local people are the ones who can answer that question, but let us take a specific example. Let us take a little town down in Texas at Red Springs. Each one of the individual farmers around there, as an individual, perhaps was not worthy of credit, and the bankers up at the county seat would have found it entirely too expensive to have looked up each one of those farmers and to have arranged to give him credit, but when the farmers at Red Springs organized into a group in a credit association, with all the resources behind any particular loan they made, all the bank had to do was to look up the credit of this whole group and then loan the money in a large amount at a time to this association, which in turn did the loaning of this money to the individuals. In other words, a local cooperative credit association was what was needed as the go-between between these little individual farmers, some of whom wanted to borrow \$50, let us say, and the bank at the county seat which had the money to lend.

Prior to this time it had been done in this way: The banker had made the loan to the storekeeper who, in turn, had made advances or sold on time to these farmers at prices which corresponded to time prices, of course. Instead of lending him the money under the new organization, the money goes to the association, and the association members are able then to buy for cash and buy to so much better advantage. The bank has the same work in either case, lending the same amount of money, let us say, and the farmers are very much better off as a result of the cooperative credit association.

In North Carolina credit associations of this kind have been developed. There is a great need of improving this aspect of farm credit. It is not a matter of taking business away from the banks.

It is a matter of better organizing the farmers for getting what they need from the banks.

Mr. ANDERSON. What did you have to do, or what did your organization have to do, with the creation of these credit associations?

Dr. TAYLOR. In this particular Red Springs case it happened that I was personally acquainted with the man who was partly on pay of the Department of Agriculture, and partly from the State of Texas, in connection with the extension work. He was the man who helped these people organize and showed them how to do it. Organizations of this kind are not new. They exist in many countries.

Our first work is to study the different ways in which the farmers may organize to get this credit, to see how these different forms are adapted to different regions with different kinds of farming, the amount of credit that is needed in the different districts, and the form of credit needed is very different in the dairy district from that needed in the cotton district, for instance, and we propose to study the needs from the standpoint of better farming, that is what are the needs and just how the farmers can organize to get in touch with the bank and the credit system that exists.

It is not expected that an entirely new credit system for the United States shall be organized to take care of the farmers. It is a question of how the farmers can articulate with the credit system that exists in such a way as to get funds when they need them, in order to increase the effectiveness of agriculture.

Referring again to the brief I have put into your hands I wish to call your attention to the studies in history and geography, the purpose of which is to bring together the evidence from the long time point of view, and from the broader territorial point of view, that gives a better balance to our judgments in regard to the proper types of farming. Here you will find some maps that illustrate what I have in mind. For instance, the shift in the wheat production, and if you will look at the charts you will find where wheat was produced in 1840, and just below you will find where wheat was produced in 1870. You find that by 1870 the wheat production in the Middle West had developed to very considerably proportions. On the other hand, by 1910, the area in Wisconsin, northern Illinois, and Iowa that was important in 1870 had ceased to be a producing area.

In other words, these changes in production are going on. In any one year we do not know about it, but all those who are studying these aspects from the standpoint of the economic changes that bring them to pass, can give very important additional advice that can not be gotten by the cost-study method. We are making the study not only from the standpoint of what is going on now, but what has been going on through a series of years, for instance, what changes have taken place in the State of Wisconsin, which used to be a wheat country. Now it is a dairy country. What are the forces that have brought that about? We contemplate in that particular case a study in detail. There was a special bulletin published in Wisconsin on that particular point.

On the other page of these charts is given the price of wheat through a long series of years, from 1825 up to the present time. Notice the shifting from year to year in the wheat price. Notice the very high price after the Civil War, and then note the gradual

fall in the wheat price during the series of years after the war, until you get to the low level of 1895. Then, in connection with that, note the great expansion in wheat production, and notice that Kansas, Nebraska, and the Dakotas, and all of western Minnesota came in and threw their great quantity of wheat into the market, and how that tended to sag the price.

The point I wish to make is simply that by studies of this kind we can better understand what the trends are, and understanding the trend, we are in a better position to give advice with regard to readjustment in farming to fit new conditions.

In regard to the subject of land economics, that is a question of land tenure.

The CHAIRMAN. In regard to this shifting, that was due last year to the Government advising people in our section, and other sections, to grow wheat, much to our regret. It cost the farmers millions of dollars, and it decreased the food supply, instead of increasing it.

Dr. TAYLOR. You could have produced more of the crops which your experience, through a series of years, had shown you paid best on your farm?

The CHAIRMAN. Yes; we would have produced more oats, barley, and corn, more than enough to make up the supply of wheat; but that has nothing to do with your work.

Dr. TAYLOR. The next subject that we wish to give special attention to is that of land tenure, that is the question of land ownership and tenancy. What is the trend? Are more and more farms going into the hands of tenants? What are the methods that can be used to make it easier for tenants to become owners, and then, to the extent that they do remain tenants, that is for a series of years, at least, while they are getting enough money with which to make the first payment on a farm, how can the relations between the landlord and tenant be adjusted in such a way as to guarantee better farming and fairness between the landlord and tenant? Those are questions that are receiving some attention at the present time.

Then there is also the question of land settlement. In a number of States where new land is being settled there are various methods of settlement, some of which are very much more satisfactory than others, and those are being studied with a view to improving the methods of getting farms. This goes right along with the problem of showing the young man how he can hope through the years to become an independent farmer, owning the farm which he operates, which we believe is very essential if he is to be contented as a farmer.

Mr. ANDERSON. Before you leave this land economics business, I notice in the estimate here that you have five subdivisions, the first of which is land resources. What are you going to do about that?

Dr. TAYLOR. Land resources is the question of studying the resources of the country from the standpoint of economic utilization. All of the land in the United States is not in farms, and it should not all be in farms. Of the land that is not in farms, which should be brought in and which should not is a very important question from the economic point of view.

Mr. ANDERSON. That is going to regulate itself under ordinary economic processes. You can not regulate that by governmental regulation.

Dr. TAYLOR. What we want to do is to study the matter and clarify thought on that subject in such a way that action may be more intelligent.

Mr. ANDERSON. How are you going to get this information in the first instance, beginning at the beginning?

Dr. TAYLOR. Information in regard to land?

Mr. ANDERSON. Yes.

Dr. TAYLOR. A very great deal of information is available at different points in the various services at the present time.

Mr. ANDERSON. There may be a whole lot of it made available after this next census is taken.

Dr. TAYLOR. Yes.

Mr. ANDERSON. Why not postpone this proposition until we get that information?

Dr. TAYLOR. The idea is this: The census does not show much about what is going on on land not in farms. Let us take the example of what has happened on lands that are now in farms and some people believe should not be in farms. Take the so-called wheat lands of eastern Montana. Just a few years ago, as you will remember, the real estate agents made a big move toward selling lands, which were good grazing lands, to people who knew nothing about those lands, as wheat lands. Their method was to advise them they could buy the land and sell it at a higher price, and they unloaded it on a great number of people. As you know, people started out in that country and tried to grow wheat on that land. It was grazing land, but they plowed it up and put it in wheat, and, as you know, for three years the crops have been a failure.

A very great deal of damage has been done to the people of the United States, not only to individuals who went out and lost all they had, but also to the people of the country, from the standpoint of the price of beef, because a large part of the land which would be good grazing land is not producing anything because production was misdirected. The idea is that the different forces in the Government service are gathering various materials which should be correlated and appraised from an economic standpoint in order that this movement toward new land may be more intelligently carried on. That, however, is only one of the aspects of the land economic studies.

Mr. ANDERSON. If you are going to chase up all these land speculators and tell the people that what we are trying to sell them as wheat land is not good land for wheat, you have got a considerable job on your hands.

Dr. TAYLOR. We will perhaps not chase the speculators, but look up the land and publish information and try to get it in the hands of the people who otherwise would be misled by the speculator.

Mr. ANDERSON. Now, tell us what you are going to do about land values. Preliminary to this question I want to say this: A good deal of this work is new. The ultimate cost of this thing is going to depend very largely upon its scope at the beginning. We are up against what I conceive to be a period of economy in Government expenditures, and consequently we must exercise such care as we are able to with a view to see that we do not enter upon activities that are going to cost a great deal of money and which are not going to result in economic advantages corresponding to the cost. Consequently it is very important that the committee should understand

as nearly as possible the scope of these various activities which you are proposing. That is the reason that I am making these inquiries.

Dr. TAYLOR. So far as the land economic studies are concerned, the major attention will be given to the problems of the relations between landlord and tenant, and the problems relating to the acquisition of land on the part of young men who perhaps start in as hired men, and become tenant farmers with the hope of becoming owners. If they can look ahead to being owners, they may be happy to go through these preliminary stages while they are earning money to make a part payment on a farm.

If the outlook is not promising, they will probably look to some other line of activity; so I say that is the thing that is especially important in maintaining upon the land the right class of people.

Turning back to the question of variation in cost, the cost of producing farm products in the future is going to depend more largely upon the quality of the men upon the farms than any other one thing, and I should say that the hope of owning a farm is the thing that is outstanding in connection with the young man who is figuring on remaining on a farm. It is one, at least, of the outstanding things.

With regard to the question of land values, this last summer, when the land boom came on in the heart of Corn Belt, we at once proceeded to gather information in regard to what had actually happened there. That information will be ready for publication in a few weeks now.

If you are interested, the information that we got covering that matter was of two forms. First, we visited a large number of counties and got over 1,000 cases of land transfers, that is each farm is a case, whether transferred once, twice, or eight times, and then we wanted to know how much these farms increased in price between spring and fall, and we found it running up into very large sums, up to \$125 and more an acre, and then we wanted to know who got the money as between the price that these farms there sold for at first, and the price later, and found that about half of it went to outside speculators, men who were stimulating land transfers, and we found that in most cases these transfers were made on a very narrow margin. When a speculator comes in and buys a farm he pays only \$1,000 down, in the first place, and then before March 1 transfers it to another and another, each one taking a margin out of it, and some farmer holds it at the end at a price appreciably above the price of land last spring, and if it is held with the idea of farming and paying interest on the new high valuation, he has a burden much larger than he would have had the year before.

What we tried to do then at the same time was to get the facts. It happened that the Iowa College of Agriculture had surveyed a large number of farms in 1914, so that they knew just what was happening on these farms in 1914. We arranged in cooperation with the college to go back to these same farms and find what had happened in 1918, in comparison with 1914; that is, how much more was the earning power of these farms in 1918, as a basis of increased land values, and the increase will show how much interest these farmers could pay on the new price and still get wages for themselves, and I can assure you in advance that the rate of interest they

can pay upon these high prices of this last summer will be a very low rate.

Mr. ANDERSON. That is all very interesting, but just what are you going to do with it? What economic advantage is coming from the gathering of this information?

Dr. TAYLOR. We expect these facts to be published so that if a land boom starts next spring we will have the facts in regard to the situation that can be put in the hands of the people so that they can act intelligently, and we believe it is very unwise for a young man, who is a tenant, to buy at the very extraordinary high prices which are based on the high price of hogs, and the high price of corn, with the expectation of paying that debt through a long series of years, when the danger is, whether we like it or not, that the price levels will be lowered, and the burden will be more than he can carry, and he will go to the wall, and bring on an agricultural depression.

In other words, it is closely related to the whole problem of land ownership on the part of men who till the soil.

Mr. JACOWAY. I think the statistics to-day show that there are more tenants in the United States than there are farm owners?

Dr. TAYLOR. The statistics for 1910 are the last statistics we have.

Mr. JACOWAY. Do you know anything about it? Is that true?

Dr. TAYLOR. About 37 per cent of the farmers were tenants in 1910, and about 62 per cent of the farmers owned land; about 52 per cent owned all of the land they cultivated, and then there was approximately 10 per cent that owned a part of the land they cultivated and rented some land from a neighbor, and then there was about 1 per cent of managers.

Mr. JACOWAY. The information I got is that there were 51 per cent tenants and 41 per cent land owners. That is erroneous, is it?

Dr. TAYLOR. That may be perfectly correct for some districts or some county or some particular State. In Illinois the percentage of tenancy runs above 50 in certain counties. In certain other regions in the southern part of the United States the percentage of tenancy runs very high. On the other hand, in States like Wisconsin, the percentage of tenancy is only about 14, but that does not mean that is true for the whole State. In the southern part of the State it is 39 or 40 per cent in some counties, and in the northern part of the State, where there is cheap land, little or no tenancy at all.

Mr. JACOWAY. In my judgment that is one of the most lamentable things in this country—the way the tenant class is increasing.

Dr. TAYLOR. That is one of the problems we want to give very special attention to, and our study of land values has a very close relation to the same subject.

Mr. ANDERSON. What is contemplated now under your fifth subdivision—land policies?

Dr. TAYLOR. Under land policies the idea is to furnish such information as will form the basis of better land policies in regard to land settlement, let us say, in regard to the utilization of new land. We want to furnish the basis. We do not want to be advocating or promoting the introduction of new legislation, but you take in the State of Illinois at the present time, the question of land policy is before the legislature, or was before the legislature last winter, and there was a commission appointed for the purpose of getting together

information which will be the basis of intelligent action in that State, where tenancy has come to be such a dominant factor and where everybody believes it is a menace to the agriculture of the State.

Our notion is that we should be able to gather the facts that will form the basis of intelligent action in regard to what to do in order to improve that situation. The State will establish some policy in this regard.

Mr. McLAUGHLIN of Michigan. The more prosperous the section of the country, the more tenants; is not that true?

Dr. TAYLOR. In the sections of high land values there is more tenancy at the present time, as a rule, than on cheap land.

Mr. McLAUGHLIN of Michigan. The farmer who has become very prosperous does not want to continue to follow the plow and do the work, and he does not have to, and he can rent and live in ease and comfort. It is a pretty hard question to handle, it would seem to me.

Mr. TINCHER. A lot of the tenants on those farms are sons of the owners.

Dr. TAYLOR. With regard to the farm-life studies, the purpose there is to get at the basic facts which enable us to understand what are the various reasons for farmers leaving the farm, instead of looking upon country life and farming as a satisfactory life throughout their lives. Studies have been made of a careful scientific character on this subject, which tend to show that in the country, as a rule, many of those conveniences and those forms of organized social life do not exist which would, if present, tend to make the farmer look ahead with satisfaction to spending his whole life in the country.

Mr. JACOWAY. Do you not think the building of good roads, a comprehensive marketing system, and cheap money will make farm life attractive? Do you not think that is the solution, in the main, for making farm life attractive?

Dr. TAYLOR. The country-life side of it is a very important side—transportation, etc.; and, in addition to that, it is desirable and necessary that the farmer have his contacts. In country life the individual is isolated and needs to be organized into groups.

Mr. JACOWAY. Good roads will bring that about.

Dr. TAYLOR. They will help. At the present time you will find a group around a certain locality who are especially favored and are getting the advantages of schooling, etc., whereas those outside of certain circles are not getting those advantages. I just happen to have a chart here of Dane County, Wis., which shows that inside of the circles they have railroads and schools, and those out about so far from these centers seem to take advantage of the schools, but outside of those circles they are not getting high-school advantages. In other words, the farther away from these centers of life, the less likely the farmers are to have the contacts that makes the life satisfactory.

The appropriation is asked for carrying on these studies from the standpoint of making the farm life more attractive.

Mr. ANDERSON. Have you got a statement showing how these proposed expenditures are subdivided?

Dr. TAYLOR. Yes.

Mr. ANDERSON. Among these different projects? You stated you would put it in the record.

Dr. TAYLOR. It is already in the record.

The CHAIRMAN. In connection with good roads, I find on page 5 of the report of the committee appointed by the Secretary of Agriculture to consider the subject of farm life this language:

If paved streets are desirable and necessary in the city, roads in the country which can be used both winter and summer for the transportation of farm products and the easy and convenient movement of the people between country and town are equally necessary and should be provided.

Are we to understand that the Government is committing itself to the building of paved roads in the country?

Dr. TAYLOR. That is a question for Congress and the Bureau of Public Roads.

The CHAIRMAN. It is the recommendation of this commission.

Dr. TAYLOR. The idea is this: In Walworth County, Wis., Dr. Galpin made a special study of each farmer to see what his contacts were, etc., and he showed, for instance, that those who lived within these black areas [pointing to a map] had high-school advantages, and those outside of those black areas were not using the high schools. Of course, the question of roads is very important. If you have better roads, you can go farther.

The CHAIRMAN. This statement is very extraordinary—"are equally necessary and should be provided." In the city 100 vehicles pass over a mile of road to every 1 vehicle in the country and 100 people are taxed and contribute to building the road where 1 contributes in the country, hence the cost per individual is 100 times greater. The average length of road, as I understand it, is about 1 mile to the quarter section. The cost of building hard-surface roads is about \$20,000 per mile; to build half of that mile it will cost \$10,000 for every quarter section of the land. The average width of a residential lot is less than 4 rods and of a business lot less than 2 rods. The two combined, less than 6 rods, which makes it only one twenty-seventh of the length of road along the quarter section.

Is it practical for the Federal Government to commit itself to these hard surface roads? Is it not safe to leave it to the State legislatures and the people in the respective communities to determine what roads they will build? Why not leave it to the good judgment of the people?

Mr. HARRISON. I do not recall the exact wording of the statement, but it does not mean that there ought to be concrete roads all over the country.

The CHAIRMAN. I take it to mean exactly what is stated in the report. It was made clear before this committee that the Department of Agriculture would not commit itself to paved roads or any other hard roads.

Mr. HARRISON. The department has not committed itself to any particular type of road. This is clearly indicated by the action that has been taken under the terms of the Federal aid road act. Many sand-clay and gravel projects, as well as hard-surface roads, have been approved by the department under its provisions.

The CHAIRMAN. You may put whatever construction on the words that you please; the word "paved" is used; yet this committee never

was committed to it; the Secretary promised the committee that he never would commit the department to hard-surface roads.

Mr. HARRISON. No reference is made in the Federal aid road act to any particular type of road. It requires, however, that all roads constructed under its provisions shall be "substantial in character" which means, according to the Secretary's report for 1919—

that the road must be so constructed that it will carry the prospective traffic with such maintenance expenses that the total annual charges will represent a reasonable expenditure for the public service rendered by the highway. It is to the interest of the States that the roads on which Federal funds are used be substantially constructed, because the law requires them, or their civil subdivisions, as a prerequisite to receiving further funds, to maintain properly all roads built with Federal aid. There is nothing in the law which restricts types of construction between narrower limits than those established by sound finance and good engineering practice.

The CHAIRMAN. I am referring to the statement made to this committee before that bill was passed. It was stated positively that that department would never commit itself to hard-surfaced roads, and here we find a recommendation—

Mr. HARRISON. As I have said, the department has not committed itself to any particular type of road.

The CHAIRMAN. The word "paved" is used.

Mr. HARRISON. I want to say again that the statement to which Mr. Haugen refers was not intended to commit the department in any way—

Mr. JACOWAY. What does it mean, Mr. Harrison?

Mr. HARRISON. It refers to good roads, roads which are "substantial in character," and this phrase must be interpreted in the light of present and probable traffic and other conditions prevailing in the particular sections where the roads are constructed. I have already given a concise definition of the term.

Mr. McLAUGHLIN of Michigan. I think Mr. Harrison is right about that.

Mr. HARRISON. There is no doubt about it.

The CHAIRMAN. There is a definite statement there. "Paved" is used. Everybody knows what a paved road is.

Mr. HARRISON. Mr. Chairman, several constructions can be given to many words, and I am stating to you now the construction placed by the department on the statement you have quoted. As a matter of fact, the statement says nothing about "paved" roads in the country. If you will examine it closely you will note that it reads this way: "If paved streets are desirable and necessary in the city, roads in the country which can be used both winter and summer for the transportation of farm products," etc., "are equally necessary and should be provided." This statement, so far as it relates to the country, says merely that roads which can be used both winter and summer—in other words, roads which are "substantial in character" within the meaning of the definition I have given here—are necessary and should be provided.

The CHAIRMAN. Is there anything else, Dr. Taylor?

Dr. TAYLOR. I think that is all.

The CHAIRMAN. Thank you, Dr. Taylor.

(Thereupon, at 12.40 o'clock p. m., a recess was taken until 2 o'clock p. m.)

Allotment of funds, by projects, for fiscal year 1920 and estimated for 1921, Bureau of Farm Management and Farm Economics.

Projects.	Allotments, 1920.			Estimates, 1921.			Increase.	Decrease.
	Lump.	Statutory.	Total.	Lump.	Statutory.	Total.		
1. Administration.....	\$35,565	\$36,830	\$72,395	\$46,660	\$46,660	\$25,735
2. Cost of production.....	20,070	3,680	23,750	\$243,090	19,320	262,410	\$238,660
3. Farm organization.....	84,795	18,740	103,535	52,000	9,440	61,440	42,095
4. Farm finance and farm relations ¹	20,360	3,800	24,160	24,160
5. Agricultural history and geography.....	22,480	9,700	32,180	28,100	9,900	38,000	5,820
6. Land economics.....	31,770	3,780	35,550	110,520	14,220	124,740	89,190
7. Rural life studies ¹	8,760	1,200	9,960	19,360	2,400	21,760	11,800
8. Demonstration activities (extension work).....	14,720	14,720	32,820	32,820	18,100
Statutory vacancies.....	10,500	10,500	10,500
Total.....	218,160	84,430	302,590	506,250	105,740	611,990	387,730	78,330

¹ A large part of the work of the project on rural organization of the Bureau of Markets was transferred to the Office of Farm Management, together with its lump-fund appropriation of \$15,780 and a statutory appropriation of \$3,800. These funds were allotted as follows: Farm financial relations (lump, \$4,150; statutory, \$2,800; total, \$6,750); rural life studies (lump, \$11,630; statutory, \$1,200; total, \$12,830).

Net increase—\$309,400.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Tuesday, December 9, 1919.

The CHAIRMAN. We will be pleased to hear Mr. Marvin next.

WEATHER BUREAU.

**STATEMENT OF MR. CHARLES F. MARVIN, CHIEF OF THE
WEATHER BUREAU, DEPARTMENT OF AGRICULTURE.**

MR. MARVIN. Mr. Chairman, in accordance with the program which Mr. Harrison has just outlined, I have prepared a statement here on the estimates for the Weather Bureau. With your permission I should like to read this, and I think the hearing may go along more rapidly that way.

The CHAIRMAN. Is it brief and to the point?

MR. MARVIN. I think so; yes, sir; probably more so than I could state it myself. In view of the fact there are a number of new members on the committee, I have taken a little time to briefly outline the work and functions of the Weather Bureau. No more concise statement of these can be given than that found in the organic act of the bureau, which in part reads as follows:

SEC. 3. That the Chief of the Weather Bureau, under the direction of the Secretary of Agriculture on and after July first, eighteen hundred and ninety-one, shall have charge of the forecasting of weather, the issue of storm warnings, the display of weather and flood signals, for the benefit of agriculture, commerce, and navigation, the gaging and reporting of rivers, the maintenance and operation of seacoast telegraph lines, and the collection and transmission of marine intelligence for the benefit of commerce and navigation, the reporting of temperature and rainfall conditions for the cotton interests, the display of frost and cold-wave signals, the distribution of meteorological information in the interests of agriculture and commerce, and the taking of such meteorological observations as may be necessary to establish and record the climatic conditions of the United States, or as are essential for the proper execution of the foregoing duties. (Act Oct. 1, 1890, c. 1266, s. 3, 26 Stat., 653.)

I quote this language to show that agriculture is only one primary interest which the Weather Bureau is required to serve.

Congress has placed the Weather Bureau in the Department of Agriculture, and the law says the Weather Bureau must serve commerce and navigation as well as agriculture. This point is emphasized in order that this committee, whose primary interests are of necessity chiefly in behalf of agriculture, may nevertheless clearly recognize how comprehensive and far-reaching is the great public service which the Weather Bureau is required to render. Without

exaggeration I can confidently say that there is scarcely any important industry or activity of the Nation which is not to a greater or less extent influenced by weather conditions, and therefore needs the advices, information, and economic benefits which flow from the full and efficient administration of all the duties of the Weather Bureau.

If you go back, gentlemen, to the joint resolution of Congress which created the Weather Service in 1870, you will see that the primary object was to benefit navigation—marine navigation—to save life and property on the Great Lakes and the Atlantic coast. Nearly 50 years of splendid service to the Nation now stands to the credit of the Weather Bureau, and to-day navigation of the air for both civil and military purposes is a complete realization. More than ever before the science of meteorology is now called upon in aid of aerial navigation. Lives and property engaged in aeronautics must now be spared and conserved, and the estimates of the Weather Bureau make provision for much-needed extensions in this direction. This service by the Weather Bureau in aid of aviation is of great importance to the Army, the Navy, the Post Office, the Air Service, and all interested in the development of civil aeronautics. It is important to recognize that the outcome of the war has brought us face to face with an entirely new set of working conditions, and these impose upon the Weather Bureau large extensions of its work if it is to continue to fully serve the public, the industries, commerce, and navigation, especially the present-day navigation of the air and of the oceans.

Meteorology applied to military operations accomplished many wonderful results during the war, and even in peace time its advices and information are indispensable to many branches of the military, such as the Air Service, the Coast and Field Artillery, the gas-warfare section, and to the Navy in its operations of heavy gunfire, navigation of the air and the oceans, and like activities.

During the war a proclamation of the President charged the Chief Signal Officer with the duty of organizing and directing the meteorological work of the Army. In a public address on aeronautics in the United States, Gen. George O. Squier makes the following statement with reference to the meteorological work of the Army developed during the war:

The success which the meteorological service has attained would have been wholly impossible had it not been for the intimate and effective cooperation which has been extended to it in all of its projects by Director C. F. Marvin and the entire staff of the United States Weather Bureau.

That effective cooperation is still in full force, as far as available funds permit, but the hand of the Weather Bureau must now be strengthened so that it can properly meet all the obligations imposed by post-war conditions and devolving upon it by force of the provisions of its organic act. No other agency of the Government now has like authority of law to engage in or perform meteorological work, and if the Weather Bureau fails to meet requirements it will certainly become necessary for other Federal agencies to undertake the work. Obviously this would involve much wasteful duplication and call for far larger ultimate expenditures.

There should be one and only one strong Government agency engaged in conducting all lines of work in meteorology. Its service

of advices, information, warnings, and observations must at all times be made available to every interest needing them or benefited thereby. Failure to meet any of these obligations opens the way to segregation of functions, duplication, and waste.

During the war the expenditures, personnel, and activities of the bureau were held to the absolute minimum. Important lines of work were curtailed, and urgently needed extensions were restricted or deferred. The funds, formerly sufficient, are now inadequate to conduct the same activities. The time has come when the appropriations of the Weather Bureau must be adjusted to its new responsibilities.

These estimates are not intended to provide for anything but urgent necessities. I wish to emphasize that our program is a great actual service to the whole public based upon a long experience of the bureau in doing like work. No large expenditures upon questionable schemes of investigation or developments with doubtful outcome are contemplated. It is altogether a question of normal legitimate growth. We can not stop the Nation from growing, and the Weather Bureau must grow with the Nation. I appeal to you, gentlemen, simply for funds to rehabilitate the bureau from the consequences of the war and to enable it to meet the new demands it now faces.

It is impossible to close this general statement without a brief discussion of salary increases, notwithstanding that all provisions for increases are excluded from these estimates because of the plans for the reclassification of Federal employees. The salary situation, however, is distressing, and I mention this unpleasant subject here only because it is so vital and because the salaries of employees of the Weather Bureau were fixed many years ago, and have remained nearly stationary ever since. As a class these men were decidedly underpaid before the war as compared with many employees in newer branches of the Department and Government.

The bonuses, etc., afford no adequate remedy for this situation, because insufficient, and they do not and can not extend even-handed justice. Loyal, faithful, and efficient employees of our bureau patriotically held their posts under distressing conditions during the war. Great unrest and discontent are now growing among these faithful public servants, as they feel more keenly the pinch of the high cost of living and see the wages of the plumber, the carpenter, the mason, the printer, in fact, of the mechanic in every grade, as also the pay of miners, railroad men, and ordinary uneducated laborers, including the salaries of professional and technical men in the industries, going higher and higher. The average daily wage of 26 building trades in New York City, as issued November 8, is \$6.87. The average daily wage of the helpers in these same trades is \$4.75. The average daily basic pay of the 500 technical field employees of the Weather Bureau, calculated on a basis of six days to the week and 50 weeks to the year, and with an average length of service of 15 years, is \$4.38. That is to say, the technical and scientific men of the Weather Bureau now receive less pay than the wage of mechanics' helpers; based upon service six days a week. As a matter of fact, the average daily pay of Weather Bureau field employees is considerably less than \$4.38, because they are required to be on duty every day in the year, Sundays and holidays included. More

than that, a large part of them perform work that carries them well into the hours of the night. Mechanics would receive time and a half or double time for similar hours, which is not available to our Government men, and which, if added to the average of \$6.87 per day shown for mechanics, makes the comparison all the more significant.

The service performed by our meteorologists is unsurpassed in its scientific technology and importance to the Nation. In the nearly 50 years of the existence of the bureau, its experts have brought the service of meteorology applied to the welfare of the Nation to a highly advanced stage of perfection. Great atmospheric disturbances visit with relative frequency one section of the country or another. Violent storms, cold waves, frosts, freezes, hurricanes, floods, heavy snows, and the like, repeatedly cause destruction of property, such as shipping on the Great Lakes and coastal waters of the Nation and in recent times the lives and property engaged in aerial navigation. Crops and farms in flooded districts are laid waste. Lambs, live stock, and meat animals in the stock ranges of the West are killed by blizzards and cold waves. Orchard crops, truck gardens, and vineyards everywhere are damaged by frosts and freezes. The men of the Weather Bureau are the sentinels ever on guard against these injurious natural forces. By forecasts and warnings, issued and disseminated well in advance, great economic benefits and saving accrue to the Nation through the precautionary measures which can be taken on timely advices to minimize or ward off injuries which otherwise inevitably attend the great atmospheric phenomena mentioned. Efficiency in the execution of this work requires military promptness and fidelity in the execution of orders and frequently entails continuous duty, day and night, whenever exigencies arise, and regardless of the conventional hours of work, and on Sundays and holidays alike.

The educational qualifications, devotion to the science, and the intellectual attainments of the men competent to perform these important functions and conduct the researches and investigations essential to progress and the development of science are of the highest order. These men now appeal for recognition—plead for simple justice in the form of adequate compensation under existing conditions.

The present plans for the reclassification of salaries of Government employees applies only to employees in Washington. Nearly 70 per cent of the Weather Bureau men are in the field, and I must urge with all the sincerity within my power that this Congress extend quickly to these men in the field the relief so long delayed, so justly deserved, and so urgently needed.

Passing from these generalizations to the more detailed features of my estimates, I must emphasize again that every increase requested is now deemed urgently necessary to enable the Weather Bureau to meet the new conditions which it now faces.

Our appropriations have remained nearly stationary during the period of the war and it is necessary that they now be brought up to working conditions at the present time.

At this point, Mr. Chairman, I should like to proceed to the detailed estimates, which begin with the statutory roll, page 25.

The CHAIRMAN. Will you take them up item by item?

Mr. MARVIN. Mr. Chairman, I should like to read a brief statement in regard to that roll, covering the few minor changes, and then we can go to a discussion of the items.

The CHAIRMAN. Kindly refer to the page of the estimates, the number of the item, and read the first line of each item in the record.

Mr. MARVIN. Page 25. This is what is called the statutory roll of the Weather Bureau.

Mr. HUTCHINSON. Before you start, may I ask you a question: Which item here is it that comprises these field operators, the ones who work outside?

Mr. MARVIN. Those will come in item 55—it is further along in the estimates; the field men are item 55, on page 29. I would like to take that up in detail later.

The statutory roll calls for no explanation, because, under the Departmental instructions, no material change was permitted except to make a few necessary transfers from the miscellaneous rolls which have been reduced accordingly.

The CHAIRMAN. Will you point out the increases?

Mr. ANDERSON. After making these transfers to the statutory roll, will you still be carrying any clerks on your lump fund appropriation?

Mr. MARVIN. No, sir.

The CHAIRMAN. Will not the lump sum appropriations carry salaries?

Mr. MARVIN. Oh, yes. Mr. Anderson spoke about clerks.

The CHAIRMAN. Future appointments made under the lump sum appropriations will not be carried on the statutory roll. So you may have a number outside of those appearing on the statutory roll.

Mr. MARVIN. Yes, sir; scientific and technical men, but not clerks. There will be a number of employees on the lump-sum appropriations; none, however, of the character that go on the statutory roll according to the plan by which the statutory rolls and the miscellaneous rolls are differentiated at the present time. These transfers, Mr. Chairman, to which I referred are the transfers which are made in accordance with the plans under which we have been working for several years. The scientific and technical men are carried on the miscellaneous rolls. The clerical force, laborers, and men of that character, are carried on the statutory roll. These transfers, for example, of two clerks at \$1,200 each.

Mr. JONES. That is subdivision 10, is it not?

Mr. MARVIN. On page 27, near the top.

The CHAIRMAN. It would be well to take them up from the beginning, starting on page 25, item 10 (32 clerks, class 1), there is an increase of two by transfer from lump fund.

Mr. MARVIN. Those are the two I am speaking of.

Mr. JONES. You reduce the clerk hire there, too, don't you?

Mr. MARVIN. Yes, sir.

Mr. JONES. It makes the difference between last year's request of \$37,200 and this year's estimate of \$37,600?

Mr. MARVIN. Yes, sir.

Mr. JONES. Your next change is down in item 24?

Mr. MARVIN. (Item 24, one supervising instrument maker.) Yes, sir.

Mr. JONES. That is true. Those are all the changes there are on that page.

Mr. MARVIN. Yes, sir.

Mr. JONES. Then on page 26, in article, 31, you have a change?

Mr. MARVIN. Item 34. (One assistant engineer, \$1,200.)

Mr. JONES. No; item 31. It is \$840 in here, and it was \$720 in the other.

Mr. MARVIN. One skilled mechanic, \$840, according to my copy, item 31.

Mr. JONES. Yes; a difference in last year's appropriation; 34 is added, is it not?

Mr. MARVIN. Thirty-four (one assistant engineer, \$1,200)—that is a new place.

Mr. JONES. The next one is 39 (one repairman, \$1,200).

Mr. MARVIN. The changes in the statutory roll are summarized on the top of page 27: New place, one assistant engineer. Transfers: Two clerks, one supervising instrument maker and one repairman. Those are the only changes in the statutory roll.

Mr. McLAUGHLIN of Michigan. And those men were formerly carried on the lump sum?

Mr. MARVIN. Yes, sir; new men taken on during the year.

The CHAIRMAN. And a new place submitted?

Mr. MARVIN. Yes, sir; a new place submitted, for an assistant engineer.

Mr. McLAUGHLIN of Michigan. Those men transferred were carried on the lump sum at the same salaries?

Mr. MARVIN. The same salaries, yes, sir. Those were new places which were required and for which there were no places on the statutory roll. Under the law, we can appoint those men on the miscellaneous roll and in the next estimates, transfer them to the statutory roll. That is the plan followed at the present time.

Mr. ANDERSON. I notice all through these estimates that apparently under your lump-sum appropriations you do not estimate for any clerks.

Mr. MARVIN. No, sir.

Mr. ANDERSON. But somehow or other during the year a lot of clerks get on that roll and then the next year they appear as transferred from the lump-fund roll to the statutory roll.

Mr. MARVIN. Mr. Anderson, in that case, in the present Weather Bureau case, you will notice, three of those places are on the aerological roll. That is a new line of work that Congress gave us money for the development of a year or two ago. We could not foresee at the time the estimates were made, just exactly the number of clerks we would need. The law gives us the authority to employ clerks under those exigencies in the development and expansion of new work. We are authorized by law to employ those clerks on the miscellaneous roll and to pay them from the miscellaneous fund until the positions are made statutory.

Mr. ANDERSON. Those are temporary clerks; not permanent?

Mr. MARVIN. They are permanent, not temporary. We transfer them in the next estimates to the statutory roll and reduce the miscellaneous fund accordingly.

Now, Mr. Chairman, if I may proceed here with my statement, I would like to call attention to a situation that is not set out in

these estimates at all as I think you should to be acquainted with the conditions under which we are struggling.

The CHAIRMAN. Before you leave this item, explain the new place item 34 (one assistant engineer, \$1,200). Let us dispose of item by item, and clear it up as we go along.

Mr. MARVIN. This new place is for an assistant engineer. The Weather Bureau has its own property at Twenty-fourth and M Streets, in this city. We have buildings and grounds and operate our own light and power plant. Men are on duty there from 6 and 7 o'clock in the morning until 10 and 11 o'clock at night. The forecast work requires work at nighttime, and our power-plant employees must be on duty there all this time and keep the plant in operation. We have one engineer now and we are asking for an assistant engineer. The plant is in charge of a fireman when the engineer is off duty. He can not be on duty all the time. It is unsafe and unsatisfactory to leave that expensive plant in charge of the fireman. We want an assistant engineer there at \$1,200 to take charge when the engineer is not on duty.

The CHAIRMAN. You say from 6 in the morning until 11 at night?

Mr. MARVIN. Mr. Calvert, at what time do they start up in the morning?

STATEMENT OF MR. E. B. CALVERT, CHIEF CLERK OF THE WEATHER BUREAU, DEPARTMENT OF AGRICULTURE.

Mr. CALVERT. The engines are started at 7 o'clock in the morning; observations begin at 7.30.

The CHAIRMAN. How much of a force have you there beyond the seven hours?

Mr. CALVERT. The map force consists, all told, of about 15 men, including the telegraph operators. These men are engaged on the scientific features of the work.

The CHAIRMAN. The whole building has to be heated from 7 o'clock in the morning to 11 o'clock at night?

Mr. CALVERT. Yes, sir.

The CHAIRMAN. With one engineer?

Mr. CALVERT. Yes, sir.

The CHAIRMAN. How many firemen?

Mr. CALVERT. May I make this statement? Up to a few months ago we had a fireman and steamfitter at \$840, who had been with us a great many years and who was competent to take care of that plant. He resigned and is receiving now, as I understand, \$7 a day in the navy yard.

The CHAIRMAN. How many firemen have you?

Mr. CALVERT. We have five, including the fireman and steamfitter.

The CHAIRMAN. How big a plant is it?

Mr. CALVERT. We have two large boilers. The horsepower developed, I can not say off-hand. The two boilers heat a group of buildings; that is, one big main building and annexes which are entirely separated from the main building. In addition they furnish the power for all of the printing presses and machine shops.

Mr. McLAUGHLIN of Michigan. These five men are not on duty all at the same time?

Mr. CALVERT. Oh, no; we have two firemen on duty from 7 o'clock in the morning until 11 o'clock at night, and one fireman after 11 o'clock.

Mr. McLAUGHLIN of Michigan. None of them work more than eight hours?

Mr. CALVERT. They work a full eight hours; we have an eight-hour shift for the power-plant employees.

The CHAIRMAN. Do they work Sundays and holidays?

Mr. CALVERT. Sundays and holidays included.

Mr. HUTCHINSON. You said you had two boilers?

Mr. CALVERT. Two boilers.

Mr. HUTCHINSON. What is the power they generate?

Mr. MARVIN. Rated at 100 horsepower each.

The CHAIRMAN. Can you give an estimate of how much coal they consume?

Mr. CALVERT. We consume a ton and a half to two tons of coal a day.

Mr. HUTCHINSON. It takes four men to fire a ton and a half to two tons of coal a day?

Mr. CALVERT. We only have two employees on at a time.

Mr. HUTCHINSON. But you have four or five firemen?

Mr. CALVERT. They work in 8-hour shifts, 24 hours a day, and there are not more than two firemen on at any one time.

Mr. HUTCHINSON. Don't you suppose it would be cheaper if you would fire them and get two good men in their places, and that you would get better results?

Mr. CALVERT. I doubt very much whether we could get men who would work 12 hours on a stretch.

Mr. HUTCHINSON. You can not get good men on the salaries you are paying?

Mr. CALVERT. That is true.

The CHAIRMAN. How much coal did you say is consumed in 24 hours?

Mr. CALVERT. About a ton and a half a day. I have not the exact figures.

The CHAIRMAN. And it takes five men to shovel a ton and a half of coal a day?

Mr. CALVERT. There are only two men on duty at one time in the plant.

The CHAIRMAN. But in all there are five men?

Mr. CALVERT. In all there are five men.

The CHAIRMAN. On the three shifts?

Mr. CALVERT. On the three shifts.

Mr. JONES. Why five; why not six? How do you manage your third shift?

Mr. CALVERT. Simply because after work is closed down at 11 o'clock at night, it only takes one man to keep the fires going. They are banked or semibanked.

Mr. HUTCHINSON. He is a watchman, then, after that?

Mr. CALVERT. You may call him a watchman, but he has to keep the fires going from 11 o'clock at night until 7 o'clock in the morning.

Mr. LESHNER. Would not those fires keep going without him?

Mr. CALVERT. I believe it would be unsafe to leave the plant alone.

STATEMENT OF MR. CHARLES F. MARVIN, CHIEF OF THE WEATHER BUREAU—Continued.

Mr. LESHNER. If that is all the coal those men shovel, they are not overworked. Do you know what a fireman usually shovels?

Mr. MARVIN. I do not, but we must have a man there whether he is busy shoveling coal or not.

Mr. TINCHER. Supposing the manufacturing interests and business interests, outside interests, were to work on that basis, how would they operate? If they had to have four firemen on in order to handle a ton and a half of coal a day, how much would get done in this country if individuals managed their business in any such manner as that?

Mr. MARVIN. That depends on what kind of a plant they operate, of course.

Mr. TINCHER. It does not make any difference what kind of a plant they operate. If you have two boilers, furnishing 100 horsepower, and keep two firemen on hand to keep those boilers running—two firemen on duty on one shift to keep those two boilers running—any business man would say there ought to be a reform in the business, I would think. Are the boilers so separated that one man can not put coal into both of them?

Mr. CALVERT. The boilers are closely related.

Mr. HUTCHINSON. Do these firemen do any other work but fire this ton and a half of coal?

Mr. MARVIN. I think not; the firemen do only the firemen's work.

Mr. HUTCHINSON. All they do is to handle this ton and a half of coal a day, these five men; is that all?

Mr. CALVERT. That is all they do, and take care of the general plant. We assign them to no other labor.

Mr. HUTCHINSON. What other work does a fireman do except put in the coal?

Mr. MARVIN. Of course, he has to keep the engine room clean and to take the ashes out and see to the hauling of them away, and see that a man calls for the ashes, and all that.

Mr. TINCHER. But a man calls for the ashes?

Mr. MARVIN. He has to place them where he can get them. We have a little hoist in the basement room that takes the ashes out.

Mr. HUTCHINSON. That is about two or three wheel-barrows full?

Mr. MARVIN. They are put onto the hoist in cans, or in receptacles of that character—fireproof receptacles. The question here is, whether it is proper administration that this heating and power plant, two generators, and all that machinery which is kept in operation up to 11 o'clock at night, should be left in charge of a man who is not an engineer, especially the kind of fireman you can employ for \$840; or whether we should have a responsible assistant engineer at higher pay to do that work.

The CHAIRMAN. Have you made investigations as to the number employed at other plants outside of your department, and how many should be required to run a plant of this sort?

Mr. MARVIN. I have not made any comparison of that sort. We have submitted this because we believe it to be a reasonable provision, and we think it is not an unfair comparison with other branches of the Government where they are operating under similar conditions.

This plant is by itself and, as I have explained, we have a printing plant and machine shop, and the power is used for running the presses and machinery. The engines are in operation all during the day, from 7 o'clock in the morning on holidays and Sundays. We have the night forecasting, which is rarely completed before 11 o'clock. Then there is the heating of the buildings in cold weather. It is a pretty long stretch on duty, and it is simply impossible for one engineer to do that.

Mr. JONES. I concede probably you are justified in asking for an assistant engineer. One engineer can not stay on duty in a plant and watch the machinery, the engines and dyamos, for 24 hours if they are continuously in operation. But is it your opinion that two firemen should be engaged at the same time, just to fire two boilers closely related and that do not consume any more than a ton and a half of coal a day?

Mr. MARVIN. I think this condition of the four firemen at \$720 has been in operation for some time, and we have felt it necessary to have that number.

Mr. JONES. Necessary, why? To run the boilers, or for some other reason?

Mr. MARVIN. No, sir; those men are engaged not only on firing work, but must look after the engines and dynamos, which require frequent attention.

Mr. JONES. Then is it your opinion it takes two firemen to fire two boilers that are closely related and burn only a ton and a half of coal a day?

Mr. MARVIN. My experience is it is necessary to have two men on duty at one time.

Mr. HUTCHINSON. Suppose a manufacturer were to run his business that way. How long do you think he would run it?

Mr. MARVIN. I am sorry to say I am not a manufacturer.

Mr. TINCHER. That is, in all six men producing a hundred horsepower in 24 hours—five firemen and one engineer. Now, it takes 100 horsepower to run many private institutions in the country, and if any one used six men in producing 100 horsepower he ought to buy new equipment if he has such equipment as that. What kind of engines are they?

Mr. MARVIN. These are internal-combustion boilers.

Mr. TINCHER. The rest of it is electrical machinery?

Mr. MARVIN. The rest of it is electrical machinery—two generators and two engines.

Mr. TINCHER. Of course, a private institution, in private business, would use three men to perform in 24 hours, one man for each 8 hours. That is what you would have to do if you were running a private business; but here you have six and are asking for seven.

The CHAIRMAN. The number seems large. In my country one engineer would shovel a ton and a half of coal and run the engine besides, without the firemen. That matter should be looked into, Doctor.

Mr. MARVIN. I would be very glad to consider a reallocation of that force if it is possible to work it out. I would like, Mr. Chairman, with your permission, to give this matter further consideration and submit a statement to you in regard to it.

Mr. TINCHER. Where is this plant?

Mr. MARVIN. At Twenty-fourth and M Streets.

Mr. JONES. What coal do they burn; soft coal?

Mr. MARVIN. Soft coal at the present time. We formerly burned hard coal.

The CHAIRMAN. You have Item No. 35 (one fireman and steam fitter, \$840). What does he do?

Mr. MARVIN. That is an additional fireman to the four that are in the previous item, and his duties, in addition to fireman, are to look after the maintenance of the steam-heating and plumbing work of the bureau. He is called a fireman and steam fitter, simply because he has this additional qualification. Very little of his time should be devoted to the power plant, but it is necessary under present conditions.

The CHAIRMAN. That is outside of the engine room?

Mr. MARVIN. His duties carry him outside of the engine room; wherever the heating equipment or plumbing of the building requires alteration or attention or maintenance.

The CHAIRMAN. You have Item 39 (one repair man by transfer from lump fund for station salaries, \$1,200). What are his duties?

Mr. MARVIN. That is the case of an employee in the field. This is a line repair man, what is called a repair man of the telegraph line. We have a telegraph line down the Atlantic coast from Cape Henry to Cape Hatteras.

The CHAIRMAN. It is outside of Washington?

Mr. MARVIN. Yes, sir.

The CHAIRMAN. He is outside of Washington?

Mr. MARVIN. He is outside of Washington.

Mr. TINCHER. What is Item 37 (one captain of the watch); is that in this main building?

Mr. MARVIN. Yes, sir; it is on this property.

Mr. TINCHER. He is a different man from these others?

Mr. MARVIN. Yes, sir.

Mr. TINCHER. Then Item 38 (one electrician)—he is in the same building?

Mr. MARVIN. That is the Weather Bureau property. The Weather Bureau property consists of a central building with a wing or extension running around the grounds.

Mr. TINCHER. This electrician has to do with the machinery that is operated by this 100-horsepower boiler?

Mr. MARVIN. Yes, sir. We have also the lighting, the heating, and the power of our building operated from this power plant; the electrician looks after all wiring, installations, etc., as well as the large number of batteries used in the operation of automatically recording instruments, signals, etc.

Mr. TINCHER. That is all the power he has any jurisdiction over, the electricity that is furnished by this 100-horsepower plant?

Mr. MARVIN. Yes, sir.

Mr. TINCHER. And the captain of the watch, does he look after the same building?

Mr. MARVIN. He is in charge of the watch force and the laborers of the bureau required in and around the grounds and the messengers who carry the maps, forecasts, and so forth, into the city routes, and the general supervision of the laboring force.

Mr. JONES. Item 39 (one repair man), that is a man out in the field? That is right?

Mr. MARVIN. Yes, sir.

Mr. JONES. What is Item 40 (one repair man, \$960)?

Mr. MARVIN. That is another repair man.

Mr. JONES. Out in the field?

Mr. MARVIN. He is in the field; yes, sir.

Mr. JONES. How about Item 42 (four repair men, at \$840 each)?

Mr. MARVIN. They are repair men who are in the field.

Mr. JONES. And Item 43 (six repair men, at \$720 each)?

Mr. MARVIN. Yes, sir.

Mr. JONES. Item 44 (four watchmen, at \$720 each), where are they stationed?

Mr. MARVIN. They are in Washington.

Mr. JONES. For how many buildings?

Mr. MARVIN. We have one main building and one auxiliary building that extends around two angles of the square.

The CHAIRMAN. It is all in one block, is it not?

Mr. MARVIN. It is all in one block; yes, sir.

Mr. JONES. Why four watchmen for them?

Mr. MARVIN. It is required; we could not properly guard the buildings with less.

Mr. HUTCHINSON. Why could we not consolidate these four watchmen with the four firemen and give them more money and get better service?

Mr. MARVIN. I do not think so.

Mr. HUTCHINSON. Why could you not get a man for \$720—

Mr. MARVIN. If I may ask Mr. Calvert—he has more knowledge of the watch force and the firemen's work—and if he can make a statement it may help to provide an explanation here as to the number of watchmen required.

The CHAIRMAN. What is the total cost of operating this heating plant?

Mr. CALVERT. I have not the figures, Mr. Chairman; but we can very easily secure them for you. We have a very competent engineer, who is intrusted with the details of the operation of the plant.

The CHAIRMAN. We would like to have an approximate amount, if you can give it.

Mr. CALVERT. That is, you wish the coal and material—

The CHAIRMAN. To heat and light the buildings.

Mr. CALVERT. I would not venture an opinion, Mr. Chairman, because it would be a guess.

The CHAIRMAN. How would it compare with the general charge the city makes for light?

Mr. CALVERT. That has been investigated a number of times, and it was found more advantageous to continue our present arrangement.

The CHAIRMAN. Would not the cost be considerably less?

Mr. CALVERT. When you figure the new equipment required in changing over from direct current to alternating current equipment, it is very much more economical under the present arrangement.

Mr. TINCHER. You mean, the cost of current in Washington is such that you could operate a 100-horsepower plant with this kind of expensive plant cheaper than you can buy the current?

Mr. CALVERT. A few years ago the matter was investigated, for the purpose of changing from our own power to city power. I was not among the men who investigated the matter, but the report showed it to be more economical to retain the present plant.

Mr. TINCHER. Do you know what the power price is for current?

Mr. CALVERT. For an individual, I think it is 10 cents.

Mr. TINCHER. Oh, no; for power?

Mr. CALVERT. For power; I do not know exactly; probably 3, 4, or 5 cents, depending on consumption.

Mr. ANDERSON. How long ago was this investigation made?

Mr. CALVERT. About five years ago.

Mr. ANDERSON. Your plant is a direct-current plant?

Mr. CALVERT. A direct-current plant, yes, sir.

Mr. ANDERSON. That means heavier wires?

Mr. CALVERT. You understand the power required principally is in connection with the printing plant and machine shop, which are near the generators. Every press and machine has its individual motor, and it would require a new motor for every press or else new converters to switch over from our own central plant to the city plant.

Mr. TINCHER. Why is that?

Mr. MARVIN. Because you can not use an alternating current to run a direct-current motor.

Mr. ANDERSON. What do you have now, 220 volts?

Mr. CALVERT. One hundred and ten.

Mr. ANDERSON. Direct current?

Mr. CALVERT. One hundred and ten voltage, direct current.

Mr. JONES. There is a machine, just one machine, that makes that transfer from direct to alternating current.

Mr. LESHER. The transformer.

Mr. CALVERT. You have to convert from alternating to direct current, which is expensive, I understand.

Mr. LESHER. Oh, no; up where I come from we change over right along. It depends on the amount you want to transform.

Mr. MARVIN. That is a transformer from a high voltage to a low voltage, not converting from alternating to direct current on a rotary converter.

The CHAIRMAN. It costs at least \$16,000 a year to run this plant, does it not?

Mr. MARVIN. I think we could make progress if you would permit us to submit a supplemental statement covering the cost of the operation of the plant on definite data we can easily get at the office. But we have not come prepared, not expecting this particular question to arise, to answer your inquiries in regard to this point.

The CHAIRMAN. After all, this is the place to thresh out these questions, but you may insert a statement.

STATEMENT REGARDING THE HEAT, LIGHT, AND POWER PLANT OF THE WEATHER BUREAU.

The Weather Bureau maintains its own plant for producing heat, light, and power. Two boilers of a capacity of 100 horsepower each are used. The electric current for light and power is generated by two separate units, an 80-horsepower engine attached to a 50-kilowatt generator; and a 30-horsepower engine connected with a 25-kilowatt generator. The work of the Weather

Bureau requires that this plant be in active operation from 7 a. m. to 11 p. m., and sometimes later, every day in the year, Sundays and holidays included. The present force employed in the plant is one engineer at \$1,300, one skilled mechanic at \$1,000, one fireman and steamfitter at \$840, and three firemen at \$720. Another fireman at \$720 per annum on the statutory roll is on duty at Mount Weather. This place will be dropped when Mount Weather is sold. The engineer is in charge of the plant. He can not be expected to be on duty for the full period of 15 hours that the engines are in operation. Therefore, the skilled mechanic and the fireman and steamfitter serve in his absence on regular eight-hour shifts. A pressure of 80 pounds of steam is carried. Two employees must be on duty during this 15-hour period, one in the boiler room and the other in the engine room.

The man on duty in the engine room must keep the engines, dynamos, and switchboard under constant surveillance. It would be unsafe to leave the engine room unattended, as one man can not feed and attend to the boilers and be in the engine room at the same time. The force is divided into eight-hour shifts. Two men must be on duty when the engines are running during the period of at least 15 hours, practically two shifts. From 11 p. m. to 7 a. m. only one fireman is required. Therefore, five men must be on duty each day. In order to give these men relief one day in seven and to provide for leaves of absence and sick leave another man is required. This man is the fireman and steamfitter who acts as relief fireman. If an assistant engineer is provided, it will insure the safety and efficiency of the plant and enable the steamfitter to devote his time to the duties relating to his position and be available for firing only in emergencies. It is difficult to secure a good fireman at \$720 per annum, and to secure a man competent to take charge of the engine room at the pay of an ordinary fireman is more than can be expected.

The per-annum cost of maintaining the plant during the fiscal year ending June 30, 1919, was approximately as follows:

Salaries (not including bonus)-----	\$5, 300
Coal, oil, etc-----	2, 227
Miscellaneous expenses, including repairs and materials-----	497
Total-----	8, 240

The question of using current supplied by commercial companies was carefully considered a few years ago. It is practicable only by the installation of expensive machinery because the Weather Bureau is outside of the direct-current area and would have to use alternating current. All of the motors, fans, and other electrical equipment in use are for 110-volt direct current. It was found that outside current could not be efficiently and economically used at the prices for outside current and machinery cost prevailing at the time the question was investigated. It would be less advantageous to do so at the prevailing high cost of labor, machinery, and material that would be required to purchase and install new apparatus. Commercial current could be used advantageously after installing new apparatus if only electric power and lights were needed, but steam must be generated in the summer months for the testing of instruments and for other purposes and to heat the buildings during cold weather, making a steam plant necessary throughout the year. To produce steam for heating and other purposes and at the same time purchase current would entail useless cost. An exact comparison cost can not be included in this statement because of the considerable time that would be required in securing quotations for the cost of new apparatus and installation.

It is believed that no economy would result in the purchase of current and that the work of the bureau would materially suffer if a change were attempted. However, the whole question will be given a careful investigation, and any changes that will effect economy and efficiency will be made without delay.

Mr. McLAUGHLIN of Michigan. Will you indicate where these repair men (items 39, 40, 42, and 43) are employed, whether in the city or outside. There are 12 of them whose salaries aggregate nearly \$10,000 for repair men. You say the first one, number 39, is a telegraph-line repair man outside of Washington; number 40 is the same. How about the item 42 (4 repair men) and the item 43 (6 repair men), where are they employed?

Mr. MARVIN. Those are outside of Washington, also.

Mr. McLAUGHLIN of Michigan. Then all of the 12 are outside of Washington?

Mr. MARVIN. All outside of Washington; yes, sir. I think that is correct, is it not, Mr. Calvert?

Mr. CALVERT. All are outside of Washington.

The CHAIRMAN. What is the nature of the work?

Mr. MARVIN. These telegraph lines are run in very difficult places where no commercial company will run a line. That is the reason we have put the lines in. There is one running from Norfolk to Cape Henry and from Cape Henry to Cape Hatteras, along the coast. It is the only telegraph line on that coast. Originally it was erected for the Weather Bureau's work alone, but it is now used by the Coast Guard and the Navy Department and they aid us in maintaining it. Some of these repair men are on this line. We have another line in the State of Washington, running from Port Angeles to Tatoosh Island.

The CHAIRMAN. What is the length of the line?

Mr. MARVIN. That line is about 50 miles, I think.

The CHAIRMAN. Fifty miles?

Mr. MARVIN. Fifty miles in length.

The CHAIRMAN. How many repair men are there on that line?

Mr. MARVIN. It runs through a densely wooded tract and is very difficult to maintain.

Mr. CALVERT. Which line is this under discussion?

Mr. MARVIN. Port Angeles-Tatoosh Island line.

Mr. CALVERT. There are four repair men on that line. It is the most difficult line we have to maintain, because it goes, most of it, through virgin forests.

The CHAIRMAN. How long is it?

Mr. CALVERT. I have the exact length of that line, 95 miles.

Mr. MARVIN. It is not a very long line. None of these are very long.

The CHAIRMAN. Can you give the length of the others?

Mr. CALVERT. The Cape Henry line is 162 miles.

The CHAIRMAN. How many repair men are used on it?

Mr. CALVERT. There are only two, because it runs through a country where the repair work is not nearly so difficult.

The CHAIRMAN. Can you give the length of each?

Mr. MARVIN. The San Francisco-Point Reyes Light line.

Mr. CALVERT. The San Francisco-Point Reyes line is 70 miles long.

Mr. HUTCHINSON. How much time do these men give as repairmen?

Mr. CALVERT. These men, you might say, are constantly on duty.

Mr. HUTCHINSON. All the time?

Mr. CALVERT. All the time. Most of them are at isolated places along the line. In addition to taking care of all the repair work necessary in their maintenance, they are telegraph operators.

Mr. HUTCHINSON. Do you have any trouble in filling the positions?

Mr. CALVERT. We do.

The CHAIRMAN. Item No. 41, one gardener; what does he do?

Mr. MARVIN. The gardener takes care of the grounds of our property that I mentioned.

The CHAIRMAN. The property here in the city?

Mr. MARVIN. Here in the city; yes, sir.

The CHAIRMAN. It is about a quarter of a block?

Mr. MARVIN. It is about a third of a block. It is Twenty-fourth and M. Streets. The Columbia Hospital and the Weather Bureau occupy the whole block.

The CHAIRMAN. What are his duties?

Mr. MARVIN. We have the gardener to take care of the grounds around the building, to keep them in presentable and respectable appearance. In the wintertime he does work with the laboring force in the buildings.

The CHAIRMAN. You mean mowing the lawn?

Mr. MARVIN. Yes sir; and keeping a few flower beds and the shrubbery in proper condition.

The CHAIRMAN. How about item No. 45, 28 messengers?

Mr. JONES. There are 166 messengers.

The CHAIRMAN. Yes; but I am referring only to those under item 45, at \$720.

Mr. MARVIN. There seems to be a large number of the messengers, but most of them are in the field. We have 200 stations, but not every station has a messenger. Very many of them have one messenger at least, and sometimes we are obliged to put in two messengers under the existing conditions. We have difficulty in securing them at the low salaries allowed.

Mr. TINCHER. What do they do?

Mr. MARVIN. They work in the offices in connection with the preparation of the forecast cards and operate addressographs and distribute maps and bulletins. They also do other work about the station in connection with the maintenance of the instrumental equipment and things of that kind.

The CHAIRMAN. How many are employed at each station in each town?

Mr. MARVIN. We have a small number of stations with only one man on duty.

The CHAIRMAN. About how many?

Mr. MARVIN. I should say there are 15 or 20 that have only one man. The rest of the stations, with a few exceptions, have from two to seven men, and a few of the large ones from 10 to 15.

Mr. JONES. How many stations did you say you had?

Mr. MARVIN. In round numbers, 200 full reporting stations.

Mr. RUBEY. I notice you have a gentleman who comes over to the Capitol every morning and fixes up the map over there. What is his title?

Mr. MARVIN. He is a meteorologist. We have work of that character in a considerable number of cities. Some of that work had to be discontinued during the war. We want some increases to enable us to restore work which was suspended from necessity.

The CHAIRMAN. Will you prepare a statement as to the cost of this lighting plant?

Mr. MARVIN. Yes, sir.

The CHAIRMAN. And also an estimate as to the cost of the service from the outside?

Mr. CALVERT. You say a comparison between what it will cost for outside current alone, and what it costs to maintain this plant?

The CHAIRMAN. Yes.

NOTE.—This information is incorporated in the statement on page 15.

Mr. MARVIN. Now, Mr. Chairman, before we leave the statutory roll, I should like to bring to your attention here, because I think the committee should know it, a feature of the statutory roll that is not covered in the estimates. I would like to invite your attention to item 20 (one printer or compositor), item 21 (six printers or compositors), and item 22 (five printers or compositors).

The CHAIRMAN. I understand you are not asking for any increase in salaries?

Mr. MARVIN. No, sir.

The CHAIRMAN. And we are not taking that matter up for consideration at this time; it has not been estimated for. It will be left for future consideration.

Mr. MARVIN. These men work in the field and the reclassification work is supposed to deal with people in Washington; but they are carried on the statutory roll.

Mr. McLAUGHLIN of Michigan. All these men you employ under items 20, 21, and 22 are in the field, you say?

Mr. MARVIN. Are in the field. We can not keep these places filled. There are vacancies occurring in them and it is impossible to employ printers at the low salaries of \$1,000 and \$1,080. We have been compelled to employ emergency printers at union wages on account of the vacancies.

Mr. JONES. They get the bonus, do they not?

Mr. MARVIN. Yes, sir. We have been compelled to employ emergency printers at union wages, at wages much higher than this. More than that, we have to pay their wages from the miscellaneous roll. The salaries provided on the statutory roll go back into the Treasury. We can not use that money for the emergency employments. It has to be taken from the miscellaneous roll at a cost higher than that paid the printers in item 19, of \$1,300. What I desire is to have these places made the same, \$1,300, to equalize them. The work of the Reclassification Commission does not extend to the men in the field, and these men are in the field. There also is the case of one skilled mechanic at \$840 (item 31). Now, I do not need to argue that you can not employ much of a mechanic at \$840.

Mr. JONES. That is item 28?

Mr. MARVIN. That is item 31.

Mr. JONES. You have one skilled mechanic in item 28 (one skilled mechanic, \$1,300).

Mr. MARVIN. That is true.

Mr. JONES. Is that the same thing?

Mr. MARVIN. It is not the same mechanic. The skilled mechanic at \$840 to which I refer is a man who has been with us for a number of years. He is engaged very largely in making kites which we use in aerological work.

Mr. JONES. I made a notation of \$720 with a minus sign of the amount appropriated for the fiscal year ending June 30, 1920.

The CHAIRMAN. If you are through, I would like to call your attention to a communication from Judge Moon as to the salaries in Chattanooga and Knoxville. He advises me that the Government

observer at Knoxville is getting \$400 a year more than the observer at Chattanooga, and says:

I write to call your attention to this matter, with the hope that you may be able to do something in the interest of the observers in the class in which Mr. Pindell belongs.

How do you equalize salaries? Are they all paid the same?

Mr. MARVIN. Mr. Chairman, I doubt if there is any branch of the Government that is measuring out justice, the even-handed justice, to its employees in greater degree than that which characterizes the administration of the salaries of the Weather Bureau men.

For several years we have had in operation a plan which the Secretary introduced in the department of classifying the employees in the order of their merit, ability, and efficiency, and claims for advancement, and all that. The efficiency ratings are prepared by a committee of employees and promotions are made accordingly; that is, whenever it is possible to make promotions. We can not make promotions until money is available, but when promotions can be made we give them to the men who have the highest positions on the register. Now, there are lots of deserving men (Mr. Pindell is one of them) who ought to have more money than they are receiving, but to take it away from some other man and give it to Mr. Pindell would not be right.

The CHAIRMAN. You pay \$400 more to one than to the other because of their duties to the city that they are in?

Mr. MARVIN. It depends not only on the size of the city but upon the value of the man's service, ability, and qualifications; and all that.

The CHAIRMAN. The size of the city does not enter into consideration?

Mr. MARVIN. It does enter into consideration to a certain degree; but you can readily see we can not fix the salary of an employee based entirely on the size of the city in which he serves. We are obliged to change men from one place to another and to follow such a plan would necessitate changing salaries with every assignment.

Mr. McLAUGHLIN of Michigan. Is the work in the different cities largely the same?

Mr. MARVIN. It differs with the cities. It is not any more the same in the different cities than the cities are the same themselves; there are all sorts of differences. One city may be comparatively unimportant in a civic sense, but may be very important from the standpoint of our work. But to a certain degree the salaries of the men in the larger cities are uniformly higher than are the salaries of the men in the smaller cities where the responsibility is less. But the question apparently raised by that letter (I should like to read it a little more carefully) is one of discrimination between the two men.

Mr. HUTCHINSON. The men in the two cities have the same titles, do they not?

Mr. MARVIN. Both are meteorologists.

Mr. HUTCHINSON. All of them?

Mr. MARVIN. All of our station men engaged on scientific work are meteorologists and observers.

Mr. HUTCHINSON. And you have it fixed in the law, the salaries each one of them shall receive, and can not vary it?

Mr. MARVIN. No, sir; there is no law which fixes the salary of these men.

Mr. HUTCHINSON. You have no bulk appropriation, have you, out of which to pay these men?

Mr. MARVIN. They are paid from lump-sum appropriations.

Mr. HUTCHINSON. That is a lump-sum appropriation.

Mr. MARVIN. Yes, sir; lump-sum appropriations; but it has no reference to this particular roll we are discussing now, which is statutory.

The skilled mechanic to which I have made reference has been making all of our kites in upper air observation work. He has been with us for a long time and is getting only \$840 a year.

The CHAIRMAN. In this connection, let me call your attention to another communication, which reads:

I am informed by the Chief of the Weather Bureau that it has been necessary for the bureau, on account of lack of funds, to discontinue the publication of the daily weather map in about sixty cities in the United States. Among them are Pittsburgh, Kansas City, Minneapolis, and Milwaukee.

Have you any comment to make on it?

Mr. MARVIN. We have included in the estimates funds to do that. We want to restore that work. However, that pertains to the field and has nothing to do with this part of the estimates.

The CHAIRMAN. We will come to that later, then?

Mr. MARVIN. Yes, sir; I will invite your attention to it when we come to the item.

Before closing my remarks on the statutory roll, I wish to ask that these printers, and this mechanic, be placed on a par with the other men.

Mr. McLAUGHLIN of Michigan. Which mechanic is that?

Mr. JONES. Item 31—one skilled mechanic, \$840.

Mr. MARVIN. Yes, sir. The particular man there is certainly entitled to \$1,200. He is a man we could not replace from any carpenter trade in the country without a long training to do the particularly difficult work of making kites.

Mr. HUTCHINSON. Is he just as good a man as 28—one skilled mechanic at \$1,300?

Mr. MARVIN. Yes, sir; in his line.

Mr. HUTCHINSON. Then why should you make it \$1,200?

Mr. MARVIN. I have only asked you to make it \$1,200.

Mr. TINCHER. What does the item "28" at \$1,300 man do?

Mr. MARVIN. That is one skilled mechanic at the central office at \$1,300. He is a carpenter?

Mr. CALVERT. He is our foreman carpenter.

Mr. MARVIN. That is what I thought; I was not sure. But only in this one respect, that he is our foreman, is there a reason the mechanic in the field should be paid less than the one skilled mechanic at \$1,300.

Mr. TINCHER. What is number 28's name?

Mr. MARVIN. That is Mr. J. A. Balster, I believe.

Mr. TINCHER. What is number 31's name?

Mr. MARVIN. Dahl Baxter.

Mr. HUTCHINSON. You say number 31 is a man in the field. Do you pay his expenses when in the field?

Mr. MARVIN. No, sir; we pay no expenses.

Mr. HUTCHINSON. You pay no expenses to anybody?

Mr. MARVIN. Only when traveling.

Mr. HUTCHINSON. He is located at one place?

Mr. MARVIN. Yes, he is located at Drexel, Nebr.

Mr. LESHER. How much printing do these printers have to do each day?

Mr. MARVIN. I have brought samples of their work with me. They get out these leaflets and bulletins that we issue every day at the different stations. Here are the different kinds of publications we issue. They vary somewhat at the different States. This work has got to be done on the minute. The observations shown on the maps issued at stations all over the country are made at 8 o'clock in the morning, and at half past ten or eleven they are ready for delivery to the people. That is rapid work.

Mr. LESHER. A part of a whole lot of these forms is set up right along?

Mr. MARVIN. It is set-up work, but changes require busy printing work during the rush hours. After the maps and bulletins are issued they have this kind, the State climatological reports, to do. These are prepared in the field, one of each of these each month, at certain of the field stations. We have 200 stations, and there are only, as you will notice there, a comparatively small number of printers, about 30 altogether. As a rule one printer does the work on two State reports.

The next item of the estimates, item 52, the general language remains unchanged. Item 53 is for the maintenance of the printing office in the city of Washington. There is a slight increase of \$2,200 asked for in that item.

Mr. JONES. Where is that?

Mr. MARVIN. That is on page 28, at the top, General Expenses, Weather Bureau—Continued, item 53, "For necessary expenses in the city of Washington incident to collecting and disseminating meteorological, climatological, and marine information, and for investigations in meteorology, climatology, seismology, volcanology, evaporation, and aerology, \$116,190."

Mr. JONES. That is \$116,190?

Mr. MARVIN. Yes, sir; an increase of \$6,940.

Mr. JONES. That is the whole thing, is it not?

Mr. MARVIN. Item 53 is for expenses in the city of Washington.

Mr. JONES. What I would like to know is this: We have gone over this statutory roll. You have this for maintenance. It is not itemized at all. It is \$116,000. It is itemized down below here, employees?

Mr. MARVIN. Yes, sir. It is the same form as in previous years for appropriations of this kind.

Mr. JONES. And none of those items are included in this statutory roll?

Mr. MARVIN. No, sir; it is an entirely separate statement of expenditures.

Mr. TINCHER. You had \$109,250 in 1920 that was spent under this item. Would it not be possible to itemize that for the committee?

Mr. MARVIN. The actual manner in which that was spent has been itemized.

Mr. TINCHER. I guess it is right on that page, is it not?

Mr. MARVIN. Yes; it is itemized. Down at the bottom you will see that we spent for salaries so much money, and so much for stationery, equipment, and material, telephone and telegraph and miscellaneous items.

Mr. JONES. You expended for 1919 \$102,503 for the same things that you ask for now \$116,190, is not that true?

Mr. MARVIN. Yes, sir.

Mr. JONES. Why do you ask for this additional \$6,940 increase in what you estimate for 1921 over what you expended in 1919?

Mr. MARVIN. The addition is required for proposed extensions of work in the field which we explain later in the estimates.

Mr. JONES. \$10,000 of it is in salaries, and then you deduct the difference from your salaries?

Mr. MARVIN. Those extensions of work in the field necessarily entail more work at the central office in compilation, study, and supervision. We ask for \$6,940 for salaries, \$5,500 incident to the vessel reporting work in the field, and \$1,440 is for the work involved in taking over the control of certain work in the field that is being conducted by the Bureau of Plant Industry. It is meteorological work. The administration of these two lines of work—the vessel reporting and the western planes observations now controlled by the Bureau of Plant Industry—justify an addition in the central office expenses of \$5,500 in the one case and \$1,440 in the other.

Mr. JONES. What I want you to explain is: You expended in 1919 for 29 employees \$46,232.17; now you are asking in your estimates for 1921 for 28 employees \$56,700, almost \$9,000 more.

Mr. MARVIN. There is a hiatus there of one year. The amount we expended in 1919 and what we expect to spend in 1921 are shown; no figures are shown for 1920, the current year, and they must come in to clear up the comparison.

Mr. McLAUGHLIN of Michigan. You propose to employ fewer men than you did in 1919, and with a great deal more work, you say, and you performed that additional work by paying your men about \$10,000 more money.

Mr. MARVIN. The comparison must be made with the 1920 appropriation and the 1921 estimate here, I think.

Mr. McLAUGHLIN of Michigan. The work has increased over what it was in 1910, has it not?

Mr. MARVIN. Yes, sir.

Mr. McLAUGHLIN of Michigan. You are doing it with fewer men?

The CHAIRMAN. According to your statement, you propose to pay \$10,467 more to 28 men in 1921 than you did to 29 men in 1919. There will be an increase in salaries there, will there not?

Mr. MARVIN. There has been an increase of salaries during 1920.

The CHAIRMAN. I mean over 1919.

Mr. MARVIN. Mr. Calvert will explain this.

Mr. JONES. It is carried on here as temporary employment, and now you want to make it permanent employment.

Mr. MARVIN. The temporary employees are carried part of the time, of course, and it makes the total number appear larger.

Mr. JONES. In 1919 you expended \$102,503.45, in 1920 the appropriation allowed was \$102,250; that is right, is it not?

Mr. MARVIN. Yes, sir.

Mr. JONES. And for 1921 you ask \$116,190; that is right, is it not?

Mr. MARVIN. Yes, sir; that is an increase of \$6,940.

Mr. JONES. Over 1920, an increase of almost \$14,000 over 1919.

Mr. MARVIN. That is the increase which came in 1919 and 1920.

Mr. JONES. Yes; and nearly \$10,000 of that increase is in salaries, with a less number of men in the period of the years 1919, 1920, and 1921.

Mr. MARVIN. I do not think we can make that comparison, unless we consider 1920.

Mr. JONES. That is a fact, is it not, from your statement that you have rendered here?

Mr. MARVIN. It is a comparison on account of these temporary employees.

Mr. JONES. Yes, I know.

Mr. McLAUGHLIN of Michigan. How many were temporarily employed in 1920?

Mr. MARVIN. The employment of the 28 men in 1921 includes, of course, this estimate of the increase of \$6,940. The question is simply whether the appropriation of \$109,250 which we had last year should not be increased \$6,940 in order to take over this vessel reporting work and the western planes observations of the Bureau of Plant Industry.

Mr. McLAUGHLIN of Michigan. I can see how there should be this additional work, Doctor, but you are doing it with fewer men than you had before when you did not have it.

Mr. MARVIN. The seemingly fewer men there is explained by the fact that many of these men in 1919 were temporary men.

Mr. TINCER. This shows how many were temporary, one temporary, seven part time, one temporary and one temporary.

Mr. MARVIN. That was during the war time, as you see, gentlemen, and some of our men in the central office were on military duty at that time, and we had some temporary men and part time men.

Mr. CALVERT. As a matter of fact, the average of the number of men employed during that time was not over 25; the number engaged at any one time was not over 25.

Mr. McLAUGHLIN of Michigan. Do you not account for a part of that increase that you ask by the fact that you have increased some of the salaries that appear in that first column?

Mr. MARVIN. No, I do not think so at all. These changes that occurred in the rolls during 1920 belong to the 1920 estimates.

Mr. JONES. This first column shows the rate you will pay them in 1921 over what you paid them in 1919?

Mr. MARVIN. The first column shows what we are going to pay next year.

Mr. HUTCHINSON. Is that an increase in there, or is that the same as it was last year?

Mr. MARVIN. We ask to have it increased \$6,940.

Mr. HUTCHINSON. On any one item, or is that on all of them?

Mr. MARVIN. It is on the general item, \$109,250. We want that increased \$6,940.

Mr. HUTCHINSON. That means additional men—not an increase of each one of these men's salaries?

Mr. MARVIN. Yes, sir; it is not for promotions; it is for additional men.

Mr. HUTCHINSON. In other words, the work in the Weather Bureau has not been increased in the last four or five years, has it?

Mr. MARVIN. The work has increased but the pay of the office force on this roll has remained nearly stationary.

Mr. JONES. Let me get that understood. I do not know whether I understand you. On page 28, Mr. Marvin, under the column "Rate," you have salaries there for meteorologists and so on, professor of meteorology, and so on down the line. It is not totaled. Are those the salaries you are paying now?

Mr. MARVIN. Practically the salaries we are paying now; yes, sir.

Mr. JONES. What did you make that up from, from the salary pay rolls now, or from the estimated pay roll that you propose to make?

Mr. MARVIN. That is made from the pay roll we are working under now, with the addition of several new places that we are asking for here.

Mr. JONES. Then that is based on your requests, and not on your pay roll?

Mr. MARVIN. Yes, on our requests based upon estimated additions to the present roll.

Mr. JONES. That is what I am trying to get at. It is not what you are paying now?

Mr. MARVIN. Partly, but it is an estimate.

Mr. JONES. Have you got a list of what you are paying these same men now?

Mr. TINCHER. There it is there.

Mr. JONES. That is what they contemplate paying. You have estimated in here for one meteorologist at \$3,960. Have you got one man at that salary now?

Mr. MARVIN. Yes, sir.

Mr. JONES. You have a meteorologist at \$3,500. Have you one at that price now?

Mr. MARVIN. Yes, sir.

Mr. JONES. You have another one at \$3,250. Have you one at that price now?

Mr. MARVIN. Yes, sir.

Mr. JONES. Then you have another one at \$2,160. Have you one at that price?

Mr. MARVIN. Yes, sir.

Mr. JONES. One at \$1,800?

Mr. MARVIN. Yes, sir, but we wish two new places at that salary.

Mr. TINCHER. They have three at \$1,800 and they are asking for five.

Mr. JONES. You have three at that salary now and you are asking for two new ones.

Mr. MARVIN. Yes, sir.

Mr. RAINY. There has been no increase in salaries, but the increase of \$6,940 is caused by four new men.

Mr. MARVIN. Yes, sir.

Mr. TINCHER. You have a lithographer at \$1,500. That is something you intend to add? You have not that now?

Mr. MARVIN. That is another case of a temporary employee. Here is the statutory roll which gives us a lithographer for \$1,200. We worked months trying to get somebody to accept that salary as a lithographer. We could not get one to accept it. We had to take a man and pay him \$1,500 out of this lump fund, and we kept him for a little while and dropped him when we could cut off some of the work, but in the meantime the money for the \$1,200 place on the statutory roll was going back to the Treasury, and it was difficult to do the work, and, in fact, we had to drop some of the work later.

The CHAIRMAN. In this connection it may be well to have an explanation of this table, and a statement by what authority it is in the record.

Mr. HARRISON. I think we ought to make it clear, Prof. Marvin, that the form used in presenting these statements is prescribed by the Treasury Department under a provision in one of the appropriation bills. We have no discretion in the matter. You will note that the statements show the expenditures for the last completed fiscal year, in this case the fiscal year 1919. I will have inserted in the record a copy of the law which requires this statement.

(The statement referred to follows:)

[Act. Aug. 1, 1914, 38 Stat., 680.]

AMENDMENT OF SECTION 6, ACT AUGUST 24, 1912, CHAPTER 355.

SEC. 10. That section 6 of the sundry civil appropriation act approved August 24, 1912, is amended to read as follows:

"SEC. 6. That there shall be submitted hereafter, in the annual Book of Estimates following every estimate for a general or lump-sum appropriation, except public buildings or other public works constructed under contract, a statement showing in parallel columns:

"First, the number of persons, if any, intended to be employed and the rates of compensation to each, and the amounts contemplated to be expended for each of any other objects or classes of expenditures specified or contemplated in the estimate, including a statement of estimated unit cost of any construction work proposed to be done; and

"Second, the number of persons, if any, employed and the rate of compensation paid each, and the amounts expended for each other object or class of expenditure and the actual unit cost of any construction work done, out of the appropriation corresponding to the estimate so submitted, during the completed fiscal year next preceding the period for which the estimate is submitted.

"Other notes shall not be submitted following any estimate embraced in the annual Book of Estimates other than such as shall suggest changes in form or order of arrangement of estimates and appropriations and reasons for such changes."

Mr. RUBEX. Let me ask you right there—in 1919 we appropriated \$109,250.

Mr. HARRISON. That is 1920, Gov. Rubey.

Mr. RUBEX. The same in 1919. In 1919 the appropriation was \$109,250.

Mr. HARRISON. Yes, sir.

Mr. RUBEX. This last column here, "Expended 1919," totals up \$102,503.45, or a difference of \$6,746.55, but they turned that \$6,746.55 back into the Treasury, did they not?

Mr. HARRISON. All unexpended balances go back into the Treasury.

Mr. RUBEY. Then you actually expended the \$102,000?

Mr. HARRISON. Yes, sir. You gentlemen appreciate that we have to allow some margin. There is a law which makes it a criminal offense to exceed appropriations, and at the beginning of the year we have to apportion our funds in such a way that we will not exceed them. There is always an unexpended balance in every appropriation, but the amount will vary in each case. We have to protect ourselves. Then men do not want to go to jail.

There are many explanations why the full amount appropriated is not expended. For example, places may be provided for new employees, and it may take us three months to get the employees. That means that we have a salary charge for only nine months of the year. Then there are temporary employees. There are eight temporary employees shown in the table before you.

Mr. RUBEY. You have estimated for \$116,190.

Mr. HARRISON. Yes, sir.

Mr. RUBEY. I will ask you is it probable that at the end of the next fiscal year, 1921, for which this is appropriated, you will not have expended quite all of that sum?

Mr. HARRISON. That is entirely probable. In one year under the food and drugs act we turned back into the Treasury nearly \$100,000.

Mr. RUBEY. There is another point about it and that is this: We make these appropriations along in January, and the bill which is passed and becomes a law goes into effect the following July, and you have some four or five months there in which to get ready for the 1st of July and find your men if you can find them.

Mr. HARRISON. Except for the last two or three years when our appropriation bill became a law around October or November.

There is another thing which ought to be considered. We begin making these estimates up in July. Just think of the difficulty of having to estimate exactly what our expenditures are going to be at the close of the next fiscal year, nearly two years from the time we began to make up our estimates! I think you gentlemen should bear that in mind in considering these matters. They are estimates. They are the best estimates we can make, based on long experience, but it is an exceedingly difficult undertaking.

Mr. RUBEY. While I am on that proposition I want to call your attention to the estimate there set forth on page 28. It shows here the appropriations for the previous years. It shows the appropriation for 1911, so much, and then it goes on and shows the estimate for 1912, \$114,000, and then back in the first column it shows the appropriation for 1912, \$106,000. Now, for the benefit of the committee I think you ought to reverse that whole business and put down your estimate first, and then on the opposite side, on the same line, you ought to have the appropriation made for that year.

Mr. HARRISON. We will be glad to do that next year, Governor.

Mr. RUBEY. You have got to start in there and look backward and downward to find out what the appropriation was.

Mr. HARRISON. If you will follow this column you will see, for instance, the appropriation for 1911, and then the next item is the appropriation for 1912.

Mr. RUBEY. You ought to put the amount estimated for in the first column, and the amount appropriated in the next column.

Mr. HARRISON. We will do that next year.

Mr. RUBEY. It would be more convenient for the committee in looking them over.

Mr. HARRISON. We will be glad, indeed, to make any changes in these estimates that the committee may suggest. Our sole desire is to put them up in the most satisfactory way and to give the committee the information it desires. We will do that next year, Gov. Rubey. This is the first time these tables have appeared in these estimates. They were inserted at the suggestion of Mr. Haugen.

Mr. RUBEY. In looking over these estimates, I find in the Bureau of Markets that they followed that plan of putting the estimates in the first column, and you put them on the same line.

Mr. HARRISON. We will be glad to comply with that suggestion next year.

Mr. MARVIN. This appropriation of \$109,250, you will note, has been in effect since 1917; that is, the fiscal year ended June 30, 1917.

Mr. RUBEY. You have not had any increases?

Mr. MARVIN. We have not had any increase, but now we ask for an increase of \$6,940.

The CHAIRMAN. Are there any further questions on this item?

Mr. McLAUGHLIN of Michigan. What is this new work that you are going to do in connection with the Bureau of Plant Industry?

Mr. MARVIN. A few years ago the Bureau of Plant Industry, in connection with the problems of determining the best processes in dry-land farming, put up certain stations on farm lands in the West, in the semiarid regions, for determining the evaporation of water and temperature conditions at points at which the Weather Bureau had no stations, and for which we could not furnish specific meteorological data that they needed in these investigations. The work has been going on, and they simply made observations in connection with that study. It is important to continue that work and to assemble and collect the meteorological observations and publish the results. That is properly the function of the Weather Bureau.

Mr. McLAUGHLIN of Michigan. Item 53.

Mr. RUBEY. That is an increase in force necessary to carry on that work, for which you ask an increase of something like \$69,000 in that item.

Mr. MARVIN. In that item; yes, sir. It is a part of that increase, but the amount intended for investigations is very small.

Mr. McLAUGHLIN of Michigan. Previous to this time, then, the Bureau of Plant Industry has been making those observations itself, and your bureau has had nothing to do with them?

Mr. MARVIN. We have had nothing to do with them. Plant Industry men have been making the observations, compiled the data, and studied it to a certain extent, but in its present form it is unavailable for general use.

Mr. McLAUGHLIN of Michigan. Why unavailable?

Mr. MARVIN. It has not been published. It is the duty of the Weather Bureau to take up and publish that sort of observation work, and under an agreement with the Chief of the Bureau of Plant Industry, and with the approval of the Secretary's office, it is proposed to transfer that work to the Weather Bureau, which will have to have some additional appropriation for the purpose.

Mr. McLAUGHLIN of Michigan. At these several stations the Bureau of Plant Industry has had men to do that kind of work?

Mr. MARVIN. They are making those observations yet, and will continue to do so, without any expense.

Mr. McLAUGHLIN of Michigan. Until you take them up?

Mr. MARVIN. And after we take them up. The two bureaus will cooperate.

Mr. McLAUGHLIN of Michigan. Then your representatives and the representatives of the Bureau of Plant Industry will both be there doing the same work?

Mr. MARVIN. No, sir; no representative of the Weather Bureau will take the observations. We will continue to use the plant industry men in the field to make the observations, but the records will come to us. You will notice the expense here is in the city of Washington for that work. The observational work in the field costs very little, simply for material, forms, and records. The work will come into the office, and we have asked for \$1,440 for the services of one man in connection with tabulating, compiling, studying, and publishing the data.

Mr. McLAUGHLIN of Michigan. Up to this time, into what office here have those reports been made?

Mr. MARVIN. The Bureau of Plant Industry; but they have never been published; they have been used only in connection with one project for which the observations primarily were taken.

Mr. HARRISON. Professor, have you made it clear that the Bureau of Plant Industry has not employed anyone to do this work solely? As I understand it, it has been done incidentally by the men at these field stations of the Bureau of Plant Industry in the course of their regular work.

Mr. MARVIN. I did not so state, but that is the fact. The men at the field stations of the Bureau of Plant Industry are there for other purposes, and have done this work incidentally, and will continue to do the other work just as heretofore.

Mr. McLAUGHLIN of Michigan. The work has been satisfactorily done?

Mr. MARVIN. We think so; yes, sir. It has been under the supervision of a very competent man.

Mr. McLAUGHLIN of Michigan. You do not propose now or at any time to put any of your agents there?

Mr. MARVIN. No, sir; not at all, because as long as they are willing to furnish us—

Mr. HARRISON. It merely transfers the supervision of meteorological work to the place where it really belongs, namely, the Weather Bureau.

Mr. McLAUGHLIN of Michigan. You keep the records here?

Mr. HARRISON. We keep the records here.

Mr. McLAUGHLIN of Michigan. The reports made by the agents of the Bureau of Plant Industry?

Mr. HARRISON. Yes, sir. Of course, the work will be supervised by the Weather Bureau, and they will suggest forms on which the reports should be made, and will improve their character so that they will be generally useful in connection with meteorological work. This meteorological work ought to be done by the Weather Bureau, in cooperation with the Bureau of Plant Industry. It is simply an attempt to put the work where it really belongs and to avoid any duplication of effort.

Mr. McLAUGHLIN of Michigan. It looks to me like it may lead to a duplication of effort.

Mr. HARRISON. Not when it is supervised by the Weather Bureau.

Mr. McLAUGHLIN of Michigan. It will, if all of these meteorological investigations they are making out there are being made by the agents of the Bureau of Plant Industry, and later will be carried on by the agents of the Weather Bureau who later will be employed there from the Weather Bureau to do that work.

Mr. HARRISON. That is not in contemplation at all, Mr. McLaughlin.

Mr. MARVIN. Mr. McLaughlin, that observation work is practically the same as what we are doing all over the United States in a similar way by men who receive no compensation at all. We have nearly 5,000 stations in the field where we obtain observations somewhat similar to these, for which we pay no salaries whatever. The men are public-spirited gentlemen. They make observations once a day or oftener, and receive no compensation. In this case the men of the Bureau of Plant Industry make the few observations a day required, in addition to their other duties, which absorb practically all of their time. We take the results of those observations and make them useful in meteorological science. The results of the observations are the things that the Weather Bureau takes over now. The actual reading of the instruments will be made by the members of the Bureau of Plant Industry, for which they receive no additional compensation. There is no intention to expand that work particularly, and all it is going to cost you is this \$1,440 in the central office administration of that work, and there is \$900 for the work in the field, in the maintenance of the instruments, and occasional travel to inspect the equipment at stations, and incidental expenses of that sort.

Mr. McLAUGHLIN of Michigan. Do they find by their observations that different conditions exist one year from another, and so on? Are there not certain settled well-known conditions out there, or in a brief time can be known?

Mr. MARVIN. Those conditions have never been minutely studied in connection with the operations of farming in semiarid regions, where it is necessary to conserve every ounce of rain that falls, and it was necessary to institute these stations in order to collect definite information along that line. Now, the data collected so far has been of value to the dry-farming work. I am not prepared to speak in regard to the dry-farming operations themselves, but the meteorological conditions in connection with it change year after year, and they want a sufficiently long record to show what the fluctuations are from year to year, and on what basis dry farming can be advocated and prosecuted successfully over a long time.

The CHAIRMAN. In regard to this figure, \$6,940, it is proposed now that the service shall be paid for out of that fund instead of the Bureau of Plant Industry's fund?

Mr. MARVIN. There is only \$1,440 in that.

The CHAIRMAN. To be paid by your bureau?

Mr. MARVIN. By my bureau. There is \$1,440 to be paid by my bureau in Washington to enable us to take over work in dry-farming sections.

The CHAIRMAN. Has any reduction been made in the Bureau of Plant Industry?

Mr. HARRISON. There was no reduction because, as I explained, these people in the Bureau of Plant Industry are merely doing the work as a part of their other duties. They are not employed to take these observations. They are employed for other purposes, the study of scientific problems in connection with dry-land agriculture.

The CHAIRMAN. You propose to employ help in your bureau to do the work that is being done by them?

Mr. HARRISON. No; as Prof. Marvin indicated, we do not expect to employ any people to do the work.

The CHAIRMAN. You increased it \$1,440?

Mr. HARRISON. That is in connection with the office here, and involves the supervision of the work, the checking and compilation of the reports, and putting them in form for publication so that they will be available for use in connection with general meteorological matters. The information has been used solely heretofore by the Bureau of Plant Industry in the study of its scientific problems. The purpose of it is to make these data available for general use.

Mr. McLAUGHLIN of Michigan. Will you be able to dispense, then, with the services of anybody in the Bureau of Plant Industry here who has been receiving and keeping those records?

Mr. HARRISON. No, sir; we will not, Mr. McLaughlin. If you wish to go into the details about that, Mr. Taylor, when he comes before you, will explain the situation.

The CHAIRMAN. Is this \$1,440 for the compilation and dissemination of the information.

Mr. HARRISON. It is for compiling and putting it in shape and checking up the reports as they come from the field stations of the Bureau of Plant Industry.

The CHAIRMAN. Was that done before by the Bureau of Plant Industry?

Mr. HARRISON. Yes, it was done in the regular course of their investigations.

The CHAIRMAN. Why should there not be a corresponding reduction in the Bureau of Plant Industry?

Mr. MARVIN. I do not think the Bureau of Plant Industry has done all they would like to have done with the data.

The CHAIRMAN. You propose to enlarge upon the service?

Mr. MARVIN. No, sir; we propose to collect those reports that have been made in the past, and continue them in the future, and put them up in tabulated form and publish them so that they will be available for students of agriculture.

The CHAIRMAN. What was done in the past?

Mr. MARVIN. Nothing but making and recording the observations. That is the point. It has not been done in the past as completely as it should have been done.

The CHAIRMAN. Of what value were they if they were not compiled?

Mr. MARVIN. They were used by the particular individuals that were actually engaged on that work, but because they were not published and are not in systematic form, they are not available for the

general study of agriculturists at experiment stations and elsewhere who are interested in that work. We want to get them together and put them into our monthly publications along with other meteorological data, so that one can have these reports hereafter, not only the past reports, but the new ones. That is the reason it is impracticable to consider a reduction.

The CHAIRMAN. Then it is to compile, publish and disseminate the information; is that it?

Mr. MARVIN. Yes, sir.

Mr. RUBEY. The total cost will be \$1,440?

Mr. MARVIN. \$1,440 in the city of Washington.

That brings us, Mr. Chairman, to item 54, "for the maintenance of a printing office in the city of Washington for the printing of weather maps, bulletins, circulars, forms, and other publications."

The CHAIRMAN. There is an increase of \$2,200?

Mr. HARRISON. An increase of \$2,200.

Mr. MARVIN. We ask for that in order to meet the great increase in the cost of paper, ink, and printing supplies. Everything that we pay for must be paid for at a higher rate now than formerly. It is a small increase. Item 55 is "for necessary expenses outside of the city of Washington, incident to collecting and disseminating meteorological, climatological, and marine information, and for investigations in meteorology, climatology, seismology, volcanology, evaporation, and aerology."

There is an increase in that fund which has been alluded to in the previous remarks a number of times. In the note at the top of page 30 this increase is explained. It says there that there is an apparent increase of \$69,200, but an actual increase of \$70,400, because \$1,200 has been transferred to the statutory roll. The increase is for several different items of work as follows:

(a) Rehabilitation and normal growth of the regular forecast and warning work of the bureau, which has fallen behind and been curtailed under stationary appropriations during war conditions and high cost of supplies, services, etc.

(b) Extension and betterment of the vessel weather-reporting service in the Gulf and Caribbean Sea, also to extend this service to the Pacific coast, where it has been needed, but only now practicable by the presence in these waters of merchant vessels equipped with wireless.

(c) Enlargement of the fruit frost work.

(d) Inauguration of 48 to 72-hour advance rain forecast at certain times and in certain places for more effective spraying of orchards.

(e) Extension of the cattle region service to Montana for aiding in the raising of live stock by reporting weather and grazing conditions, giving notice of damaging storms, etc.

The CHAIRMAN. What is the character of the service last mentioned?

Mr. MARVIN. In the cattle raising regions we secure a number of reports from the ranges and grazing tracts occupied by cattle that show the amount of precipitation and the general weather conditions there during the summer time, to determine the availability for these animals of field food, and grazing. In the winter season we keep the cattlemen informed as to the severe weather conditions so that they can herd up their stock and give them protection from the severities of the weather. It is a very important service.

The CHAIRMAN. Can you state an instance where you have been of particular service to the cattle people out there?

Mr. MARVIN. This is for an extension of that work in Montana. We have this work in Oklahoma, Texas, the Pan-Handle region, and Colorado, and the stockmen think a great deal of it.

The CHAIRMAN. Is it possible to forecast as to the storms with any degree of accuracy in a particular locality?

Mr. MARVIN. We do that, Mr. Haugen, so successfully that the people are clamoring for this service. We do not claim to be infallible. There is not any doubt in my mind about the value of the service. It is certainly beneficial, and the economical value of it to the cattle raising industry is unquestionably large. They save thousands and thousands of dollars. One forecast of cold weather, for instance, in the northwest has saved thousands of lambs. We received testimony of that from the people in the field.

The CHAIRMAN. For instance, when you forecast the weather conditions in the northwest, does that mean a particular locality or one quarter of the continent?

Mr. MARVIN. In the case of cattlemen say, whenever they receive a report of very cold weather or snow they send out their herdsmen and bring in their cattle and give them protection, those that are weak and feeble.

Mr. McLAUGHLIN of Michigan. In the State of Montana, where you are going to establish this work, how many observation stations will you have?

Mr. MARVIN. There might be half a dozen stations or more added to the work in the field. Those stations simply report weather and temperature conditions by telegraph, and receive a small fee for making observations and telegraphing the reports.

Mr. McLAUGHLIN of Michigan. They report actual conditions after they arise. Do they make forecasts and predictions of a change of weather?

Mr. MARVIN. Those reports show actual present conditions and come into our central office or district center. It is on those reports that we make the forecast of the conditions. These forecasts are sent out from the district center, in that case, probably Helena.

Mr. McLAUGHLIN of Michigan. Then the observations in Montana will be made at the different stations in Montana and reported where?

Mr. MARVIN. And reported to Helena. That is the center of that district. These reports will go into that station, be bulletined, and distributed.

Mr. McLAUGHLIN of Michigan. And then the forecasts and predictions will be made up at Helena?

Mr. MARVIN. Not exactly. The forecasts of severe and all other weather are made at the district forecast center, which is Chicago in this case, and sent back through Helena to the cattle interests.

Mr. McLAUGHLIN of Michigan. What means do you take to spread the news through Montana so that the cattlemen may know what your information of the coming weather is?

Mr. MARVIN. It goes first into the newspapers, and then it goes into bulletin cards that are distributed to the cattle raisers themselves, to owners, to bankers, and to the others who are interested in that industry. We send it to them, and they see that it goes to the

individual herdsmen who round up the cattle and give them protection.

Mr. McLAUGHLIN of Michigan. Those forecasts are published in the newspapers. Do you have to pay for those?

Mr. MARVIN. No, sir.

Mr. HARRISON. They are telephoned, too?

Mr. MARVIN. They are telephoned in many cases.

Mr. McLAUGHLIN of Michigan. They are disseminated in other ways by cards that you speak of?

Mr. MARVIN. By forecast cards and by bulletin. The printing I spoke of a moment ago includes those bulletins. I think perhaps I have a cattle-region bulletin here.

Mr. McLAUGHLIN of Michigan. I was trying to find out how your forecast reaches those that are interested in it.

Mr. MARVIN. Take for instance, at Oklahoma City, where the service is in operation, and at Amarillo. The cattle industries in those sections are organized to a considerable extent. We place our information at the centers of the industry. The information goes to the bankers, the cattlemen, and stock interests. They see that their constituency are advised in regard to these conditions. It goes to Amarillo, Tex., and other cities in Texas, and each cattle interest is on the mailing list to receive this information from our office at certain places. At certain other stations it is telegraphed directly to some particular individual who agrees to disseminate it. In some other cases, as Mr. Harrison calls my attention to, it is telephoned from the local office at Amarillo, Houston, Oklahoma City, or some of the other stations, to those parties who are on the list, and who we know are interested. You may be sure there is nothing left undone to disseminate this information.

Mr. McLAUGHLIN of Michigan. After you make the forecast what expense is involved to your bureau in this dissemination?

Mr. MARVIN. Merely the telegraphic expense; in some cases very little. There is very little expense involved in the dissemination after we once get the result and the information to disseminate. The expense to us is in collecting the information and working it up and making the deductions, the scientific deductions from the reports as to what the information should be. That is the large expense involved.

Mr. TINCER. I do not understand yet. You get this information. Kansas has this service, you say?

Mr. MARVIN. Yes, sir; perhaps.

Mr. TINCER. You have your observatories in Kansas, you have places where they get the information, and then they forward you the information, and you issue bulletins showing what the weather is or going to be.

Mr. MARVIN. Yes, sir.

Mr. McLAUGHLIN of Michigan. You get that information at your central office by wire?

Mr. MARVIN. In most cases the information comes in by wire. That is a part of the expense.

Mr. McLUGHLIN of Michigan. Then it would not be worth much, unless it did, would it?

Mr. MARVIN. No, sir.

Mr. TINCHER. You spoke of Amarillo. They have a chamber of commerce there. Of course, cattle being one of the principal industries, they notify the people of the weather forecasts. Do you know how they get their weather forecast that they depend upon, the chamber of commerce at Amarillo, how they get it there?

Mr. MARVIN. They get it from the Weather Bureau, I think.

Mr. TINCHER. No; I just want to suggest something to you. Do you know, as a matter of fact, that the railroads, for economic reasons, are very much interested in keeping the stations informed as to weather conditions? I do not know what project you have for notifying the chamber of commerce at Amarillo, but I know that they get the information they act upon through the Santa Fe Railroad stations. They depend upon them for their weather forecasts.

Mr. MARVIN. The Santa Fe gets it from the Weather Bureau, and they are distributing agencies in that sense in their own interest.

Mr. TINCHER. Yes; the railroads are doing that.

Mr. MARVIN. They cooperate with us to the extent of passing along the good work, and that is true of almost every activity. The railroads are vitally interested in shippers' forecasts and cold-wave forecasts which affect the shipment of perishable products. The commission merchants are interested in them. As soon as the information is available at the Weather Bureau it is passed over to the railroad-operating officials, and they pass it down the line. The same is true of commission merchants.

Mr. TINCHER. You say the railroads depend upon the Weather Bureau for their forecasts?

Mr. MARVIN. I do not know of any source of forecast information that is authentic and based on bona fide data that does not originate with the Weather Bureau in the last analysis. The Weather Bureau is the only agency in the Government that is engaged in the practical conduct of meteorological work. No other agency is making authentic, reliable observations of temperature conditions, and we do not know of anybody who understands the art of forecasting as well as the Weather Bureau.

Mr. TINCHER. I do not know. Suppose they receive a telegram stating that a storm is coming from Washington?

Mr. MARVIN. That comes from the Weather Bureau, probably.

Mr. TINCHER. I do not know but what it comes from the locality of the storm. Of, course, they have to have reliable information.

Mr. MARVIN. The source of authentic forecasting is lodged in the Weather Bureau. There may be agencies which offer forecasts, but they are not what go over the country generally, as far as I understand.

Mr. TINCHER. Does your department communicate at all, we will say for instance, with the chamber of commerce at Amarillo, Tex.?

Mr. MARVIN. Yes. The official at Amarillo is in immediate contact with the chamber of commerce, and we supply many of these chambers of commerce with maps such as you have over her in the lobbies of the House and Senate. The chambers of commerce are most clamorous for information. It is difficult to satisfy their requests.

Mr. JONES. You have this net increase about \$70,000, and you estimate it will be necessary to meet about six different propositions.

Have you in your own mind figured out how it is divided among these six different items, (a), (b), (c), (d), (e), and (f), so we will get some idea as to the way you are classifying it?

Mr. MARVIN. The amounts are not set out in detail.

Mr. JONES. About how much of this \$70,000 additional would you need under subdivision (a), for instance?

Mr. MARVIN. Under subdivision (a), about \$40,000.

Mr. JONES. And under subdivision (b)?

Mr. MARVIN. \$9,500.

Mr. JONES. And (c)?

Mr. MARVIN. \$9,000.

Mr. JONES. And (d)?

Mr. MARVIN. \$7,000.

Mr. JONES. And (e)?

Mr. MARVIN. \$4,000.

Mr. JONES. And (f)?

Mr. MARVIN. \$900.

Mr. JONES. That makes \$70,400, does it?

Mr. MARVIN. \$70,400.

Mr. JONES. In your tabulated statement—this is simply for information—you have again the same thing called up before as to what was expended in 1919, and your estimate for 1921 still has that lapse of 1920 between, but under the heading of observers and assistant observers you have for your estimate for 1921, 38, and you extended in 1919 to 312 persons, temporary and part time, of course. The question I ask is whether you expect to get the same amount of service with 38 permanent employees or observers and assistant observers as you did out of 312 in 1919?

Mr. MARVIN. We expect to get more.

Mr. JONES. Why.

Mr. MARVIN. I would like to give you, if you will permit me, Mr. Chairman, a statement in regard to these increases that will apply to that question there and to all of these items. This is the question of service. Service is impossible without men. The man power of the bureau is at the lowest possible ebb. During the war nearly 175 Weather Bureau men entered military service. Replacements were made mostly by young boys, in several cases by women and girls in a temporary status. The trained men remaining on duty carried the major burden of the work, and in addition they had to train and instruct the new men. A slight increase in the total number of employees occurred at this time, because it was absolutely necessary in some cases to add two or three inexperienced and untrained men to take the places of one or two who had gone on military furlough. Nearly all the men have now returned to duty. Some of them have not returned because they can get more money outside. The temporary men, including the excess, have been let out, and our service has been reduced to the prewar strength as regards the number of men.

I would like to ask you gentlemen to recognize how rigidly Congress limits my so-called lump sum for salaries. The language of the appropriation reads, "including not to exceed \$672,500 for salaries."

Mr. McLAUGHLIN of Michigan. Where is that?

Mr. MARVIN. It is on the bottom of page 29 in the heavy brackets, "including not to exceed \$726,800 for salaries." My appropriation for salaries this year is \$672,500. This is already in effect a statutory roll and has been ever since the appropriation of 1915, when this form of appropriation was adopted. At that time the item carried 465 men. The amount of the roll has been slightly increased in the meantime, and so has the number of men employed. We now carry about 483 men. That is the actual roll made upon December 1. The amount of the roll has been slightly increased in the past several years.

Mr. JONES. Is that your pay roll or statutory roll?

Mr. MARVIN. That is the men on this miscellaneous roll, not the statutory roll. We now carry 483 technical and scientific employees on that roll at an average basic pay of about \$1,375 per annum. During the past five years this average per annum pay has remained nearly stationary. At least 200 of the officials which go to make up the average per annum pay are in charge of the 200 stations of the bureau. These are representative men in their communities, and are of coordinate importance and responsibility to postmasters and city officials, and yet their average basic pay is \$1,375. I think you must see that this is a state of affairs that should not exist.

Moreover, this explanation is offered to refute the charge that extravagant increases in pay and in granting of promotions are possible in lump sum appropriations and are prevented in statutory rolls. No maladministration of salary appropriations is possible with the lump sum appropriation of the Weather Bureau. You have given me a form of appropriation there that absolutely forbids any excess.

The CHAIRMAN. In what respect does it differ from the appropriations made for other bureaus?

Mr. MARVIN. The maximum sum that can be expended for salaries is fixed, which automatically limits the maximum number of employees. It is a "not to exceed" amount.

Mr. JONES. When that sum was fixed, was it not fixed with a view to reaching the largest possible service, and was it intended that the maximum should be exercised even though the service was not necessary?

Mr. MARVIN. That was true at the beginning, but under the stress of the present times and the high costs of service, the slight unobligated surplus or working reserve normally essential for this kind of a fund has been absorbed.

The CHAIRMAN. Before you get away from lump sum appropriations, I understood you to say that it was not in the power of the bureau to advance salaries. Is it not customary to transfer an employee from one roll to another, and then back with an increased salary?

Mr. MARVIN. That is absolutely forbidden by law. We can not do that sort of thing.

The CHAIRMAN. I believe it was stated here last year that that was being done.

Mr. MARVIN. I can not recall any such statement. What I mean to say is that it is forbidden by law to transfer a man from the statutory roll to the lump-sum roll and increase his salary. If we

do so there must be an entire change of responsibilities and duties. You certainly can not ask me to take a man who is an assistant in charge of a station, and put him in charge of an important city station, make him move himself and his family to that station and not pay him any more salary. There is not any justice in that.

Mr. HUTCHINSON. You say you have 200 stations around in different parts of the country. Is there different pay for different stations?

Mr. MARVIN. The pay depends upon the responsibilities and the ability of the man.

Mr. HUTCHINSON. I was going to take up the Trenton, N. J., station. We have a splendid service there, and an efficient man. Can you tell me his salary? Do you recall it?

Mr. CALVERT. \$1,800, not including the bonus.

Mr. HUTCHINSON. Do you know how much help he has?

Mr. MARVIN. He has two men, I think, and a messenger.

Mr. HUTCHINSON. That is the best salary you can give that man for the service he does?

Mr. MARVIN. That is the best salary we can give. You see, for 483 men the average pay is \$1,375, and if I need an extra man I have to demote 10 men \$100 apiece to get a new man at \$1,000, simply because the little reserve in this salary fund to which you have limited me is now fully obligated.

Mr. HUTCHINSON. Where is his title in this?

Mr. MARVIN. He is a meteorologist, he appears as a meteorologist.

Mr. HUTCHINSON. You have some at \$2,880?

Mr. MARVIN. Yes.

Mr. HUTCHINSON. Why is the man at Trenton only worth \$1,620 when they get a good deal more?

Mr. MARVIN. The man at Trenton is one among 40 who receive \$1,800.

Mr. RUBEY. And they get a bonus in addition to that?

Mr. MARVIN. Yes; they get a bonus in addition to that.

Mr. RUBEY. That is \$2,040.

Mr. MARVIN. Yes; \$2,040 for the Trenton man.

Mr. JONES. Are those salaries fixed according to the station, or according to the length of service?

Mr. MARVIN. By the length of service and experience of the man, his ability, and the responsibility of the station duty. There are 75 stations that are practically on a par with Trenton, N. J., in service. There are 40 men, I should say, that are practically on a par with the official in charge of the Trenton station, and those men receive \$1,800 apiece.

Mr. HUTCHINSON. Do you do that by civil service, or what?

Mr. MARVIN. They are all civil-service employees. I explained a while ago that the status of the men in their different salary grades is fixed by this efficiency classification. There is no service of the Government, I do not care what branch it is, where greater care and justice is done than in the Weather Bureau and the Department of Agriculture in determining the amount of pay and opportunities for promotion of the men. The man at Trenton is in a place where there are many others like it.

Mr. HUTCHINSON. Where is this man located that gets \$2,520? What office is that?

Mr. MARVIN. The official in charge of Philadelphia gets \$2,520, as I recall, and the man in charge of the New York station gets \$2,520.

Mr. HUTCHINSON. Then you do consider the size of the city, do you not?

Mr. MARVIN. To a certain extent. I stated a while ago that the size of the city to a certain extent determines the responsibilities of the men.

The Philadelphia station is what we call a section center, and he takes care of all the observations in the State, and he has a number of other interests to look after than the station at Trenton, N. J., which is also a section center for a smaller State.

Mr. HUTCHINSON. I do not see how you can keep them. We give more money to men who shovel fertilizer than you do to those men holding those positions. They have got responsible positions. I notice that in 1919 you had 921 men, and this year you ask for 658, and still ask for \$56,873.18, the same as you expended in 1919. Where does that go?

Mr. MARVIN. The comparison, as I said a while ago, in connection with the central office work, that covers a large number. It covers a turnover among 900 individuals employed.

The CHAIRMAN. Would it not be well to state the temporary employees in 1919 and the number now to be employed permanently, so that we may get this correct?

Mr. MARVIN. You wish a comparison of the number of permanent places we carried in 1919 with the number we expect to carry in 1921. This estimate for 1921 is the best estimate we can make for the permanent number of employees.

The CHAIRMAN. We want the reason for the increased appropriation for less men than you previously had.

Mr. MARVIN. You can not make that comparison, for the reason that this condition in 1919—

The CHAIRMAN. It is for us to explain this matter to the members of the House when the bill comes up on the floor. We should have it clearly indicated in the record. By stating the number of temporary employees that you intend to make permanent, I take it, will explain it fully. We should have the exact number.

Mr. CALVERT. I think I can make that point plain to you, Mr. Haugen. As has been indicated before, it is rather difficult to draw any clear comparison from these tables in the form we are required to submit them. Even the men who make them up have difficulty in doing so. But the 921 figure there means the number of individuals that were employed on that roll during the fiscal year 1919. It does not mean that at any one time 921 men were on the rolls. As a matter of fact, the average number on the roll at any one time comes nearer to being 500 than 921.

The CHAIRMAN. If you stated that in 1919 you employed 921 men, and stated the number temporarily employed, and that now for 1921 you propose to employ 658 on the permanent roll, that would account for the increased appropriation.

Mr. CALVERT. Yes, sir; that is a very fair statement.

The CHAIRMAN. You had better state the number here in concise form so we will not have to run through the hearings to get the facts in order to explain it to the membership of the House when the bill comes up for consideration.

Mr. RUBEY. I have figured it up from this table, counting those who were employed temporarily and those who were employed part time, and out of this 921, 240 were employed either temporarily or part time.

The CHAIRMAN. How many are to be employed permanently in 1921?

Mr. MARVIN. I think we can straighten that out in a statement we will submit.

The CHAIRMAN. I believe you should prepare such a statement, so that we may have it.

Mr. JONES. Why was the decided increase from 1919 to what you estimate for 1921, and for what you had in 1920, for meteorologists at \$1,620? In 1919 you had seven employed, with five temporarily employed. You apparently had in 1920 73 permanently employed, and now you ask for 75. Why was the jump from 7 to 73 from 1919 to 1920?

Mr. MARVIN. That is the number we expect to carry in 1921.

Mr. JONES. I say why was the jump from 7 to 73?

Mr. MARVIN. It was provided in the estimates to take care of the men we had on the 1919 rolls at that time. Those men were increased, the number in that particular grade. There were some reductions in other lower grades.

Mr. JONES. Then from 1919 to 1920 you jump on meteorologists from 7 to 73.

Mr. MARVIN. 73; yes, sir.

Mr. HUTCHINSON. I would like to ask you another question. I notice here you have got \$726,800 for salaries. Do I understand you can not apportion that to a certain number of men, for instance, 500 men or 600 men, or fix the salary according to your own judgment?

Mr. MARVIN. We can; yes, sir; that can be done, but we must be fair and just to all the men in doing so.

Mr. HUTCHINSON. Do you not think you can go to work and give a little more salary to fewer men and get more service?

Mr. MARVIN. You ask about less men. I have just explained here that the maximum amount of money I have to expend is \$672,000. I can not dispense with a single man. In fact, stations are begging for more help.

Mr. HUTCHINSON. Why can you not?

Mr. MARVIN. The man power of the stations is at the lowest possible ebb. We must have more men to extend this service. We are taxed to the utmost to do what we are doing now. We have not had any material increase in this appropriation since 1917.

The CHAIRMAN. Then, Professor, are you contending for an increased appropriation over the estimates? You say you can not get along with less men.

Mr. MARVIN. I am trying to explain that we would use this money for more men; we would increase the number of men we have.

The CHAIRMAN. Do you propose to employ more than 658 men?

Mr. MARVIN. No, sir; that number is greater than at present, but the number we estimate for 1921.

The CHAIRMAN. The 658 are enough to take care of the service?

Mr. MARVIN. That is the idea. They are all to be made permanent with the exception of short period or emergency employments that will be required from time to time.

Mr. JONES. Nine altogether?

The CHAIRMAN. Why so many temporary employees in 1919 and so few this year?

Mr. MARVIN. That is simply because every man whom we could employ that had not a civil-service status was called a temporary man. He was taken on temporarily because the Civil Service Commission could not furnish eligibles. We can not get them now. The turnover during the war, due to military furloughs, resignations, etc., was very large. I have got some so-called temporaries now.

Mr. HUTCHINSON. Do you have to take the civil service men?

Mr. MARVIN. Yes; these are all civil service men, if they are permanent men.

Mr. HUTCHINSON. Will you prepare a table indicating the number of temporary men in each instance and the number that have been made permanent?

Mr. MARVIN. Mr. Calvert reminds me that there were nearly 175 men who went into the military service. Those places during the war time were temporarily filled by this large number of men you see there.

Mr. HUTCHINSON. I call your attention to this one item here of observers, assistant observers, vessel reporter, apprentices, and messenger boys, \$960 to \$480. In 1919 you had 187 temporary and 8 part time. Now you suggest only 4 part time. That is a reduction of 191.

Mr. MARVIN. Mr. Chairman, I am sorry, indeed, that there is this confusion from trying to make up from this particular table which we were required to submit to comply with the law and which does not show the real facts of the case. The total number of men in the 1919 appropriation is the number that were actually paid for out of that fund at that time, the number of individuals. They were not all on the rolls at the same time.

Mr. JONES. They may have had nine men working for a period of one month.

Mr. MARVIN. We had many cases where several men held the same position in a short time.

Mr. JONES. I think the suggestion of the chairman is a good one, that you should show how many men were employed on the permanent roll and how many were employed for a temporary period.

Mr. MARVIN. We can do that and will be glad to make the whole matter clear.

General expenses Weather Bureau.

³ Part time.

Mr. MARVIN. In regard to this restoration of service that I have been speaking about, Mr. Chairman, and the necessity for more men, I would like to have you make inquiries as to the necessity for this work. Ask men, for instance, like the Lake Carriers' Association at Duluth, Detroit, and Buffalo.

The CHAIRMAN. In that connection let me ask you just a few questions about these forecasts. In forecasting a storm do you advise the particular locality which will be visited by that storm?

Mr. MARVIN. Yes, indeed.

The CHAIRMAN. How closely? Is it not a fact that at times you forecast storms in certain sections of the country, which are diverted and appear a distance of 100 or 200 miles away from the locality warned?

Mr. MARVIN. Sometimes that may be true to a certain extent.

The CHAIRMAN. Is it not quite general?

Mr. MARVIN. No, sir; but we do not claim to be infallible, Mr. Haugen. We make a verification average, according to the most fair examination that we can make of the data, of something like from 88 to 90 per cent.

The CHAIRMAN. What does the 88 per cent mean?

Mr. MARVIN. It means that when we forecast a cold wave or a storm in a particular locality that storm will be found there at the time indicated in the forecast 9 times in 10.

The CHAIRMAN. By locality do you mean a county, a State, or several States?

Mr. MARVIN. In the case of storms it may be a State, or in other cases it may be a dozen States. A cold wave that we forecast, for instance, will sweep over a dozen States or 20 States before it disappears. Each forecast for a particular locality or State will be verified about 88 per cent of the times.

The CHAIRMAN. If you should forecast a storm for St. Louis, and that storm should be diverted to Galveston, would that be included in the 88 per cent?

Mr. MARVIN. No, sir; that would be an absolute failure. We would not pretend to count such a thing.

The CHAIRMAN. If it was diverted only 100 miles, would not that be included in the 88 per cent?

Mr. MARVIN. If it came within 100 miles, and if it was a general storm, it would; yes, sir.

The CHAIRMAN. Fifty miles?

Mr. MARVIN. It would be given a proportionate value in the verifications. We take into account the percentage of the States that is covered by the precipitation, if it is a precipitation forecast.

The CHAIRMAN. Of what value is the forecast of the storm to St. Louis if the storm appears within 100 miles from St. Louis?

Mr. MARVIN. It might not be of much value if St. Louis were not affected by the storm; but if forecasts are verified 88 per cent of the time the benefits that come in this 88 per cent more than offset the failures in the remaining 12 per cent.

The CHAIRMAN. Is it not true that frequently you have forecasted a storm for a certain day that has turned out to be clear, while other days you have forecasted clear weather that have turned out to be stormy? What is true as to Washington is true as to my section of the country and I believe true as to every section of the country. I would like to ascertain the accuracy of these forecasts and what value they are. What are we getting for the money expended?

Mr. MARVIN. There is an enormous economic value to the Nation from our service. While the value is enormous, we do not know the amount of saving that our bureau effects in dollars.

The CHAIRMAN. That is rather indefinite.

Mr. MARVIN. The benefit is not so much, Mr. Haugen, in the forecast of a little rain that may not come to-day or to-morrow, but the benefit is in the forecast of great storms on the Lakes, the seacoast, and the Gulf of Mexico; the great cold waves that come from the northwest and affect tremendous areas of the country, freezing orchards and fruits. It is the service to these specific interests that is most beneficial.

It is of the greatest economic value to the people. I can not convince you from my own statements that these services we are rendering are valuable. You asked me, as I understood you, about the verification and what good this has been to the people. I was trying to speak to that point.

Now, as for the need of the service, people who need it are asking us for this extension which we have requested.

In the middle of September, about, we sighted a hurricane down in the islands of the West Indies. That hurricane appeared there as the most innocent looking thing. The observations that we had upon which to base our deductions were very meager; but we were immediately on the alert, every man in the Bureau and on the Gulf coast was on the alert at the time of the appearance of this storm, because hurricanes, as you know, are fearfully destructive storms. Well, every 12 hours or oftener we had additional reports; we called for special observations between the regular ordinary observations of 8 a. m. and 8 p. m. That hurricane was headed toward our southern coast. It would move through the Florida Straits, according to our calculations. It struck Key West with destructive force. We sent warnings well in advance. We have testimonials from the people of that city of the splendid work of warning that was given of the approach of that storm. We could not prevent the storm, but the people there took protective measures to avoid the effects of the hurricane, which they could not have done without our warnings. Shipping left the track of the hurricane or stayed in port. As the hurricane went west of Key West warnings were sent to all the stations along the west coast of the Gulf and all intermediate points. For five days that hurricane was moving westward.

The fact of the matter is, Mr. Chairman, that our warnings were so effective that from the time that hurricane left Key West we got no reports from it. There were no vessels out in the Gulf to report to us by wireless where the storm was located. We got no reports. Why? The vessels had been told to remain in port, and they did remain in port. They heeded our warnings, which indicated to them the region of the Gulf in which the storm was located. The consequence was that we had only the observations that could come from the coast stations 100 or 200 miles from the storm center. It was very difficult for our forecasters to determine exactly where the center of the storm was.

We knew that it was somewhere south of New Orleans, somewhere south of the Louisiana coast. The study of the sea and the pressure observations on the coast indicated that that storm was near Louisiana, we could not tell just where. At one time, the conditions led us to believe that that storm was moving closer to the Louisiana coast. We made an announcement accordingly, and we warned all the people to the west of that storm.

Warnings were flying at that time on all the west Gulf coast. The observations that came in in the afternoon and that night showed that the storm instead of moving toward the Louisiana coast as we had surmised, and as we were justified in surmising, from the information we had, was really continuing its westward course toward the south coast of Texas, and by Sunday afternoon the storm had reached Corpus Christi. You know something probably of the damage it did there.

The storm was several days in crossing the Gulf, and finally went inland south of Corpus Christi. I could not say how many millions of dollars' worth of shipping were saved by the warnings we sent out. Every man in the Weather Bureau in the South was on the job. Many of them were in their offices all day and all night. Those men are faithful men; they are worthy of the highest consideration for their ability and fidelity.

The CHAIRMAN. I am interested in knowing with what accuracy these forecasts are made.

Mr. MARVIN. Those forecasts save millions and millions of dollars. It may be there was some dissatisfaction. We can not quite satisfy everybody. We are not professing infallibility, but we certainly feel confident that we are rendering a mighty service to the Nation. I doubt not but that if those interests that we are serving were asked, they would testify at once to the great value of the service, notwithstanding the fact that we make occasional failures.

Mr. JONES. You can not figure in dollars and cents the service rendered, because you do not know what transportation has been saved on vessels in obedience to your warnings.

Mr. MARVIN. Shipping generally heeds the warnings of the Weather Bureau.

Mr. JONES. And the testimonials which we have from the shipping facilities and from the Great Lakes shippers, and those people who are directly interested, what do they say about it?

Mr. MARVIN. I am prevented, gentlemen, from asking any of these people to say anything to you. If I were to ask the Lake Carriers' Association, or the chambers of commerce in the cities where we install these weather maps, or any of these people in the West that are interested in forest-fire protection, if I were to ask them to say anything to you about our work, I am afraid you would consider that I was influencing legislation. There was a law passed at the last session of Congress that would put me in jail if I did any such thing as that. But I do wish you would do it yourselves.

I can not bring in the testimony of these people as to the value of this service, but I certainly would like to have you ask the people whom we are serving in these ways as to the value of this service. Ask some of the cattlemen in Oklahoma City and in Texas as to whether our cattle-region service is of any value to them.

The CHAIRMAN. I have talked with a number of cattlemen and have looked into this matter considerably. I did not bring up the subject to criticize the work done by the bureau, because I know of the efficiency in the bureau, but the question is are these appropriations justified? Is the service of sufficient value to the cattlemen? That is the reason for my raising the question with what degree of accuracy you forecast these storms?

Mr. MARVIN. My answer is 88 per cent. For instance, in this forest-fire warning service that we are asking for we will undertake to tell the people, and especially the forest rangers, that the dry conditions and the prospect of winds are very favorable for the inception and spread of forest fires or of the coming of rains that will check forest fires. Now, the percentage of verification there is high enough to make that a very profitable piece of information to these interests. They want that information. They want us to give it to them, and we are trying to get the means to do so.

The CHAIRMAN. The committee will now recess. We will hear Mr. Marvin further this afternoon.

(Thereupon, at 1.15 o'clock p. m., a recess was taken until 2.30 o'clock p. m.)

AFTER RECESS.

The committee reassembled at 2.30 o'clock p. m., pursuant to recess.

WEATHER BUREAU—(Continued.)

STATEMENT OF MR. CHARLES F. MARVIN, CHIEF OF THE WEATHER BUREAU—Continued.

The CHAIRMAN. The committee will come to order. Are you ready to proceed, Mr. Marvin?

Mr. MARVIN. Mr. Chairman, when we took a recess I think we were practically through with item No. 55.

Mr. McLAUGHLIN of Michigan. Before you leave that, Mr. Marvin, I would like to call your attention to that item, or that subdivision, in which you ask an increase for some work that you are going to take over, that the Bureau of Plant Industry has been doing in the arid regions. You ask for an increase in one of the other items to take care of it.

Mr. MARVIN. Mr. McLaughlin, that work that the Bureau of Plant Industry formerly performed, and which we are taking over, we will estimate will cost us \$2,540. I have explained that in the fund for expenses in Washington we want \$1,440 for the central office participation in and supervision of that work. Here is \$900 additional for the work in the field. Finally, there is an increase of \$200 for traveling expenses in item 56. That makes up the \$2,540, which we consider necessary for the conduct of that work. Now, this \$900 in the field is for the purchase or renewal of instruments for the maintenance of that work in the field.

Mr. McLAUGHLIN of Michigan. I supposed the reports would reach your department the same as they used to reach the Bureau of Plant Industry. In fact, I think you said that those returns would be made to the Bureau of Plant Industry just the same; that they would be made to you also, and that you would tabulate them. They don't have to be sent twice, do they? The expense of sending them don't have to be added here, does it?

Mr. MARVIN. The Weather Bureau, under the proposed arrangement, must prepare and supply the forms and the record sheets on which those reports are made and replace instruments that are worn out and have become no longer useful.

Mr. McLAUGHLIN of Michigan. In the first item there is maintenance expense. We have provided for that.

Mr. MARVIN. Which item do you mean?

Mr. McLAUGHLIN of Michigan. The first item we spoke of this morning, where you ask \$1,440. There is maintenance expense in that and there is maintenance expense here.

Mr. MARVIN. That is true, the (a) item for the restoration of suspended work. Extension and growth of the work is really a very different class of work from this of these plant industry stations.

Mr. McLAUGHLIN of Michigan. I am speaking about the subdivision f under 55 and carrying with it the note under 53.

Mr. MARVIN. I will refer to my note on 53.

Mr. McLAUGHLIN of Michigan. In regard to this work that you are going to take over from the Bureau of Plant Industry, or the work you are going to do in connection with the Bureau of Plant Industry, how many items of increase of expenses do you have in connection with that?

Mr. MARVIN. The whole work requires \$2,540. We have work in Washington and work out of Washington; also a small item of \$200 for travel. We have divided the amounts of this \$2,540 into \$1,440 in Washington, \$900 out of Washington, and \$200 for field travel.

Mr. McLAUGHLIN of Michigan. Why do you need any work outside of Washington? I gather from what you said before that the work in the field is to be done just as it was before, but that the data was to be sent to your office for tabulation.

Mr. MARVIN. That is true, as far as the work of the observer is concerned, but you must recognize there are expenses for paper, forms, records, and all that, together with instrumental equipment at the stations.

Mr. McLAUGHLIN of Michigan. The instrumental equipment is there, and they are using the same men that you are going to use under the new arrangement?

Mr. MARVIN. The instruments will not last forever. There is a certain depreciation which must be maintained.

Mr. McLAUGHLIN of Michigan. You mean that you are going to take over the supply and maintenance of those stations, where heretofore they were supplied and maintained by the Bureau of Plant Industry?

Mr. MARVIN. Exactly. We take over everything; yes, sir. We take over the supply and maintenance of those stations. Hereafter the Bureau of Plant Industry will have nothing whatever to do with them, but their man will make the observations and fill in the forms and send us the reports.

Mr. McLAUGHLIN of Michigan. I didn't get that idea from what you said this morning. I thought everything in the field was to be done just exactly as it has been done, and that the data was to be sent to your hands, to be looked over by your people and tabulated and published.

Mr. MARVIN. If that is the impression you got from my previous remarks, Mr. McLaughlin, I would like to correct that by saying that this does contemplate the future maintenance cost in the way of new equipment and to the supply of forms and records on which the observations will be entered and all new equipment as required, all of which will be paid for from our funds hereafter.

Mr. McLAUGHLIN of Michigan. Has the amount that has heretofore been allowed provided for that kind of work under the Bureau of Plant Industry been reduced so as to take into account the amount that has been spent by you for that work?

Mr. MARVIN. I think Mr. Harrison said this morning that there was no reduction for this, and I believe he also said that Dr. Taylor might make a statement in regard to that transfer when he comes before you.

Mr. McLAUGHLIN of Michigan. The amount of money involved is small, but it looks to me like a duplication, and you know some of

these small matters attract more attention on the floor and cause the chairman more trouble than large amounts.

Mr. MARVIN. That is quite possible. I can assure you that there is no attempt to duplicate or to do any unnecessary work in this connection. The amount is small, as you say, because the work that we expect to do is relatively small, but we think that amount is necessary. We can not do that additional work without some cost to us. Now, elsewhere in the hearings I have tried to impress upon the members of the committee that we are at the last limit as to what more work we can do with the men we have. We are just up to the breaking point now.

The disposition of the bureau is to render every service possible to anybody that wants the service whenever we can give it to them, and we have taken on work here and there, a little bit at a time, which it would be ridiculous to come to you for an appropriation for, but we can not do that any more. We have come to the place where we can't take on any more work, no matter how trifling or insignificant it seems. We have got to have a little working balance of money to do any new work with, and my whole increases here are simply to rehabilitate this service in the field and put us in a position to meet the demands as they present themselves to us to-day. During the war we have conscientiously refrained from presenting increases in our estimates here, because the money was needed for other purposes. We have refrained from asking for any increases, and our appropriations have remained nearly stationary. I can not refrain from asking further increases now, because I think the country is entitled to the service, and I think it is proper and just. I am trying to give you exactly the needs as they come to us.

Mr. McLAUGHLIN of Michigan. The chairman of the committee directs most of these matters. We are only humble members of the committee, but I have in mind that it is the duty of this committee to cut these things to the bone, in view of the fact that with all the revenues that are available we are going to have a deficit of over \$3,000,000 next year.

Mr. MARVIN. Yes; I know. My duty as an administrative officer, I think, is to cut the thing to the bone, and I believe we have cut them down to the utmost. Now, we have come to the position where we have got to cut off more service. Our men are unable to do more service in the field with the number of men we have. You can readily see that there is certainly a limit to the amount you can do with a given amount of money and a given number of men. The purchasing power of money has not increased; it will not pay for as much work and service now as it did a few years ago.

Mr. McLAUGHLIN of Michigan. There is no doubt about that. Increases of salaries must be provided for; men must have more money. I don't know of anybody who wishes to see men work for less than they are worth.

Mr. MARVIN. These are not for increases; these are for additional men; of course if we fill these new places with men now in the service they will be given the salaries intended for the new places and appropriate to the duties and responsibilities required.

Mr. McLAUGHLIN of Michigan. When it comes to additional men, to extensions of service, there may be a question whether this is the time to extend the work.

Mr. MARVIN. Of course, I will have to leave that to the judgment of the gentlemen of the committee.

Mr. ANDERSON. Perhaps you have referred to it already, Mr. Marvin, but I notice in the note here on page 30 you have a reference to the inauguration of a daily corn and wheat service. What does that contemplate?

Mr. MARVIN. Just what item is that?

Mr. ANDERSON. On page 30, near the bottom of the note under "e," you have this statement:

For the extension of the cattle region weather service to Montana, where the live stock in 1918 was valued at approximately \$1,500,000, and to inaugurate a daily corn and wheat service in sections of the country where large quantities of these cereals are grown, but which the bureau has been unable to cover because of lack of funds.

Mr. MARVIN. That is in conjunction with the cattle region work that we were speaking of this morning, and that has reference to the reporting of weather conditions, both for the cattle region work and for the corn and wheat regions, where those products were not previously grown to any considerable extent.

Mr. ANDERSON. What does that service contemplate which is not contemplated by the ordinary weather service bulletins?

Mr. MARVIN. The service consists in securing reports from outlying stations by telegraph, and concerning weather conditions that show the effect of the weather on the growth of these important crops. These reports are tabulated in little bulletins like this. [Indicating.] I haven't a corn and wheat report with me now, but it is very like one of these, it gives the weather conditions in the regions in which these crops are grown—corn and wheat. We already have that service in operation covering all the great grain-growing States, except that now we have to extend it somewhat to cover those regions in which extensions of agriculture of that kind have occurred in the past few years. I said a moment ago that we can not expand any more with the funds that we now have.

Mr. ANDERSON. I take it from your statement then that this is not forecasting service at all?

Mr. MARVIN. No, sir; it is not exactly forecasting service; it is a statement of the conditions in those growing districts, in those agricultural districts.

Mr. PURNELL. How are those reports distributed?

Mr. MARVIN. These reports are distributed very much as I explained this morning, from the outlying stations to the chambers of commerce, the grain exchanges and to individuals that are interested in those products and commerce therein.

Mr. ANDERSON. Do they get them on application?

Mr. MARVIN. There are certain people that apply to receive those reports every day, and they are on the mailing list. They are also posted in the exchange. The distribution is made to those regions that can be reached immediately during the day, say. There is no telegraphic dissemination of the information in those bulletins, but it is a telegraphic service for collecting the information.

Mr. ANDERSON. Are these bulletins used at all by the Bureau of Crop Estimates in determining the conditions of the crop at a given time?

Mr. MARVIN. The Bureau of Crop Estimates makes considerable use of the information in regard to weather conditions that we issue in this way, but I can not say that it is a determining factor in their estimates of production.

Mr. ANDERSON. Then, the principal value of these reports is to the speculator on the stock market?

Mr. MARVIN. I have no doubt that the speculator is benefited, but that is true of all the crop information that is issued, whatever the source. This can not be avoided. All persons interested in crops, including growers, millers, bona fide dealers (and these constitute the larger number) find the information invaluable and demand it. It is a statement showing the atmospheric weather conditions over the country from week to week. It is the authentic statement of the conditions as affecting agricultural products. It standardizes and stabilizes the information. It furnishes it from an authentic source, and if that were eliminated from the Government work, I don't know how the interests affected would get along without it.

Mr. PURNELL. What would that elimination mean?

Mr. MARVIN. That is a hypothetical question, but I think it would mean fictitious reports sooner or later.

Mr. HUTCHINSON. Professor, do I understand that this is a department of the Weather Bureau that is reporting the conditions of wheat and corn?

Mr. MARVIN. Not the conditions of the crop; no, sir; simply the weather conditions in the wheat and corn and grain-growing States; crops, rice, sugar cane. They take the conditions of the weather on a given day and summarize it week by week in these grain-growing and agricultural States. It is a service that has been in operation for many, many years, and is comprehended in the organic act of the bureau. We would not administer the bureau without doing that, under the terms of the organic act.

Mr. HUTCHINSON. We have some department now in the Department of Agriculture that does get these estimates and reports conditions of the grain.

Mr. MARVIN. That is the quantity of production; this is the weather conditions over the agricultural districts as it affects the growing crops.

Mr. HUTCHINSON. Do they use that? Do they use your information?

Mr. MARVIN. They make use of it afterwards to a certain extent in arriving at an estimate of production, but we give this information on the day of the observation or at the end of a week, as the case may be.

Mr. HUTCHINSON. Supposing it does not rain; it is real dry about all the time; do you report dry weather?

Mr. MARVIN. We report all weather conditions, but not the crop estimates. They may refer to our reports of dry weather, but we make the report of the weather conditions, and the Bureau of Crop Estimates utilizes that information. They consult our chart of weather conditions when they make up their quantitative estimates of

production. But I would like to emphasize the difference in the two kinds of work; we are dealing with the weather and its influence on crops, and they are dealing with the crop production.

Mr. HUTCHINSON. It looks to me to be a duplication. They have men all over the country—I don't know whether it is under the farm agents or what it is—that reports the condition of grain.

Mr. MARVIN. I think they do not report the weather.

Mr. HUTCHINSON. Does that have any effect on the crops? I mean your reports?

Mr. MARVIN. No, sir; the reports do not affect the crops, but we state what the weather conditions are in the crop-growing districts.

The CHAIRMAN. If you will quote from the report that will give the conditions of the crops.

Mr. MARVIN. The past week was generally favorable for crop growth and farm work, the last three days being particularly pleasant for field operations. The rains are becoming lighter and less general. Showers in excess of one-half inch were confined to the southwest quarter of the State, although there were a few showers north of the Missouri River from Clay to Carroll, thence north to Livingston County. They were heavy enough to locally interfere with work in the counties of Livingston, Clay, Pettis, and Dent. Wheat, rye, and oats harvest has become general; in the southern counties thrashing wheat has begun. Farmers are having some difficulty cutting the river bottoms because of soft ground, and a small amount will be lost. The wheat crop as a whole is rated as being good to excellent.

This is a portion of a report of Columbia, Mo., issued Tuesday, July 1, 1919.

The CHAIRMAN. To whom do you send out those printed reports?

Mr. MARVIN. This is disseminated from Columbia, Mo., to everybody that this report can reach within this 24-hour period.

The CHAIRMAN. Do you publish similar reports each day to send to all subscribers?

Mr. MARVIN. I don't know what the issue of this is. There are a few hundred copies sent from Columbia, Mo. Now there is a similar report of that kind from other States. Here is a report from Boise, Idaho. These are simply sample reports of the kind that are issued at stations, and they differ from each other.

Mr. PURNELL. I would like to know how a report of that kind could possibly benefit a corn raiser out in Indiana or Iowa, for instance.

Mr. MARVIN. That is only a sample of the reports that the bureau issues for the crop-growing districts. The fact of the matter is that this is only part of the service designed for the farmer. We give him also a weather forecast for the day in order that he may plan his farming operations. It is difficult to impress upon you the great variety of service that is given by the bureau in the different interests and in the different sections of the country. It is an extremely varied species of service, the distribution of the forecast, the distribution of these corn and wheat region reports, the distribution of the cotton region reports, of sugar cane, cattle region reports, and forecasts of frost, to orchardists, stages of rivers, minimum temperatures for shippers, etc. Each of these constitute a species of service in particular sections, according to what they are interested in. We

apply the atmospheric conditions for the benefit of the community in which we disseminate the information, and we make it useful to them in the conduct of their commercial and industrial operations.

The CHAIRMAN. What amount do you estimate for this service?

Mr. ANDERSON. There is an increase there for that service of \$4,000.

The CHAIRMAN. How many items are carried for equipments in the bill?

Mr. MARVIN. This one item—

The CHAIRMAN (interposing). Is this the only item carried in the bill for equipment for your bureau?

Why don't you put all of the equipments under one head for the whole bureau?

Mr. MARVIN. This form is the same as in every estimate we have submitted before.

The CHAIRMAN. It is now divided up into smaller units.

Mr. MARVIN. That is true. Now we have a few new items, and we set out these increases based on the purpose of the work rather than material required to do the work because it seemed to us easier for the committee and for Congress itself to see just what we wanted to do. For instance, later on we come to an item—

The CHAIRMAN (interposing). I know; but wouldn't it be better to have it under one item?

Mr. MARVIN. It would simplify our administration of the matter if the committee prefers to have us do that. We can consolidate this all into that one item.

The CHAIRMAN. Why not put all the equipment for the bureau under one item?

Mr. MARVIN. Just what should we include in equipment, for example, in order that I may understand just what your idea is? You understand that when a form of bill is once agreed upon we adhere very closely to that form. Now, this form has been running for several years.

The CHAIRMAN. But, after all, it makes more bookkeeping and overhead expense. Whenever you divide it into divisions and bureaus there is, of course, an overhead charge.

Mr. MARVIN. I don't think so. I think the consolidation of this into one large appropriation would make it more difficult to set forth the purposes of the expenditure. We have segregated these items at the present time in order that they may be considered independently of each other on their respective merits.

The CHAIRMAN. That is proper, applied to certain projects; but when it comes to equipment for the bureau I take it that all might better be under one head.

Mr. MARVIN. You refer now to equipment—instruments?

The CHAIRMAN. Yes.

Mr. MARVIN. And chairs and office furniture?

The CHAIRMAN. Yes; everything in the way of office equipment.

Mr. MARVIN. If the committee wants us to make the appropriation bill on that basis, we would be very glad to make it up in that way; but, as I said a moment ago, we have submitted the estimates here in one form, according to the previous practice, and if you wish us to change this form we will be glad to do so.

The CHAIRMAN. I think it is proper to segregate the projects; but, for instance, under the heading of "Equipment," a number of these things might just as well come under one head and thus simplify the bookkeeping and materially reduce the expense.

Mr. MARVIN. I don't understand how there could be any artifice of classification or allocation of expenditures which would lessen the cost of doing the work. We now have this appropriation about which I am speaking, of \$1,373,430.

The CHAIRMAN. What is the next item?

Mr. MARVIN. The next item is on page 56, "For official traveling expenses."

The CHAIRMAN. You are asking for \$28,200.

Mr. MARVIN. Yes, sir; \$28,200.

Mr. McLAUGHLIN of Michigan. This is extra expense for meteorological observations for the Bureau of Plant Industry?

Mr. MARVIN. There is \$200 added there for traveling expenses incident to that work.

The CHAIRMAN. That work is growing?

Mr. MARVIN. Yes, sir.

The CHAIRMAN. The next item is No. 57.

Mr. MARVIN. Item No. 57, "For the establishment and maintenance of additional aerological stations, for observing, measuring, and investigating atmospheric phenomena, and the issuing of weather forecasts, advices, and warnings in the aid of military, naval, and civil aeronautics, and in the development of navigation of the air."

That is for the meteorological work in aid of aviation. I don't think I need to enlarge on the development of aviation within the past two years. We have made certain changes in the language there simply to make the language more specific and include the work that heretofore has been done under the appropriation. The original appropriation for this particular purpose came during the war and was made on the Army appropriation bill. The next year the appropriation was transferred intact to the Agricultural bill. It was first made on the Army bill, because the Agricultural bill had already been passed by Congress and the Army bill was pending and the money was needed immediately in the connection with the military operations. As I stated this morning, nearly 175 of our men went into military duty. Many of those men went into that part of the military duty that had reference to meteorology, and our work in military operations was confined almost exclusively to upper air meteorology. We now want to bring that work up to the growing demands of military operations and civil operations in the development of aeronautics. There is an estimated increase there of \$200,000.

Mr. McLAUGHLIN of Michigan. The second paragraph of the note on page 32 says:

Through cooperation with the Signal Corps, the Weather Bureau has inaugurated a limited forecast and warning service regarding upper air conditions at about 20 Army stations, together with five additional stations operated by the bureau.

Now, will you tell us what you do at one of those Army stations?

Mr. MARVIN. The Army stations are maintained by the Chief Signal Officer at the military post. At the present time those stations make observations with what we call "pilot balloons." Now, a pilot balloon consists of a little rubber balloon something like the

children have, only a little bit larger. It is filled with hydrogen and is tied up tight and released. One or two men with an instrument which we call a theodolite watch the flight of that balloon just as far as they can see it. It ascends through the air at a known rate. We know pretty accurately how rapidly it ascends. We observe its position with this theodolite once a minute. The position is written down and a graph is made showing the track of that balloon through the air, both in its horizontal wanderings with the air currents and also in the vertical ascent. We chart those observations and they tell us the direction of the motion of the wind in the levels that the balloon occupies successively, and when we get done we can tell you that at 1,000 feet the wind is moving 3 miles an hour or 10 miles an hour in a certain direction; that 5,000 feet up it is moving at a very different velocity and in a different direction.

Mr. McLAUGHLIN of Michigan. How many of those observations do you make in a day?

Mr. MARVIN. Generally two; sometimes more at each station. We make an observation in the forenoon and another observation in the afternoon.

Now, at the present time—when these estimates were written the number was a little less—we have 11 stations making those observations. The Signal Corps had 20 at that time, but they now have 12.

Mr. McLAUGHLIN of Michigan. Are those entirely reliable? Doesn't the direction and velocity of the wind and the different currents way up in the air change very rapidly sometimes?

Mr. MARVIN. Not so rapidly as they do at the surface, Mr. McLaughlin.

Mr. McLAUGHLIN of Michigan. Not so rapidly, but do they not change quite rapidly?

Mr. MARVIN. They do change but are more stable than they are at the surface. Now we have made observations of the surface winds twice a day, morning and evening, and that is our telegraphic report. We make these balloon observations twice a day. In the intensive military observations in France, they made observations six times a day with these balloons.

Mr. JONES. Why did they do it?

Mr. MARVIN. To take account of very local conditions, of local changes, possibly; and to make sure that they are on the right track.

Mr. JONES. Then they thought it was subject to change every hour or two, didn't they?

Mr. MARVIN. Yes, sir; they did. They wanted to make sure that there weren't any changes there. It is not necessary that the changes do occur, but if they did occur, they wanted to know it.

Mr. McLAUGHLIN of Michigan. Can you tell us how they governed their ascents and the operation of the balloons in line with your suggestions, or in line with your findings?

Mr. MARVIN. The aircraft going into the air learn the direction and velocity of the wind by these reports. The artillery wants to know what that direction and velocity is, even more minutely, because they want to know what kind of resistance is operating against their big projectiles; and these more frequent observations are more for artillery purposes than they are for aviation purposes. However, the aviation man wants all the information he can get.

Mr. McLAUGHLIN of Michigan. Is the work you do there so particular and so technical, requiring such highly trained men that it must be done by men in your bureau? Couldn't it be done by other men employed around that station and engaged in that general work of aviation?

Mr. MARVIN. Some of the aviation men might be able to do it. They could be trained. When the chief signal officer of the Army had the task of forming a personnel to do this work, he called upon the Weather Bureau to assist him. We spread about 150 men from the Signal Corps throughout our stations and gave them intensive training for a couple of weeks. That happened at the very early stages of the war. 150 men were not sufficient. They wanted to train more men and they established a military school at College Station, Tex. We gave them a high grade meteorologist and assistant and they employed another one, and these men went down and for several months they taught a school of over 300 recruits at College Station in Texas. Gave instructions in these matters that I am speaking of, pilot balloon observations, clouds and meteorological observations of all kinds. The flight of balloons is one of the most difficult kind of observational work in meteorology we have. It is much more technical than reading a thermometer. It takes a very capable man or a pair of men to start up these balloons and get the observations with sufficient accuracy to give us reliable results. The work is difficult.

In addition to these pilot balloon stations, my estimates here contemplate work with kites. We now have six stations at which kites are flown once a day or oftener, and sometimes continuously throughout 24 hours—36 hours when the conditions permit of it—and with the kites we are able to get observations of temperature, pressure and the humidity in the free air. We get the velocity of the wind in the free air also by means of a little instrument that is attached to the kites.

Mr. PURNELL. At what altitude—what is the highest altitude at which you can take these observations?

Mr. MARVIN. With kites?

Mr. PURNELL. Yes; or with these balloons, either one?

Mr. MARVIN. Some of these pilot balloons have attained altitudes as high as 10 miles, I think, or more.

Mr. PURNELL. I mean these balloons that you release. How high do they go?

Mr. MARVIN. Ten miles in extreme cases.

Mr. PURNELL. You can observe them 10 miles away?

Mr. MARVIN. That has been done. In the ordinary average case the altitude attained is lower than that, say, 4 or 5 miles, and lower, according to the visibility of the sky.

Mr. PURNELL. How high can you fly a kite?

Mr. MARVIN. We have gotten over 4 miles with kites. That represents the limit. Now, the pilot balloon work gives us motions of air up to, say, 50,000 feet. We can go higher in exceptional cases.

Kites will go up to 10,000 or 12,000 feet under ordinary working conditions. We frequently get that.

We want to use—and I provide in the language here for still a different means of exploring the free air by what we call the "sounding balloon." The sounding balloon is larger than the pilot balloon,

or we take two big pilot balloons and hitch them together and attach an instrument to the system. The difference between the pilot balloon and the sounding balloon is that the sounding balloon carries an instrument. That instrument makes a record wherever that balloon goes, and it keeps on going until the balloon bursts. There is a little parachute attached to it that permits the instrument to return gently to the earth, and we recover the instrument and get the record. The sounding balloon goes to very great height in the atmosphere under favorable conditions, over 20 miles in extreme cases. Our mechanics in the Weather Bureau during the past year developed instruments to be used on sounding balloons which are extremely light; therefore, the balloon that is able to carry them is much smaller. We made observations with these sounding balloons before the war to a limited extent, but the rubber balloons that we needed for that purpose were all obtainable only in Europe.

Mr. PURNELL. Do peace-time conditions justify the expense and pains that it takes to carry out this work?

Mr. MARVIN. I can not too strongly emphasize how valuable the information which the Weather Bureau collected during peace times from its one aerological station before the war proved to be at the time of the war. It was almost the only information of the kind we had of the conditions in the free air within the United States.

Mr. PURNELL. I can see how that might be very valuable during the war, but I am asking you whether or not in your opinion this expense is justified during peace times?

Mr. MARVIN. I think as a peace-time proposition it is abundantly justified.

Mr. PURNELL. Is the principal object of it the conservation of human life?

Mr. MARVIN. The application of the knowledge obtainable only that way to the conservation of human life is one of its vital features.

Mr. PURNELL. Is that the principal feature of it?

Mr. MARVIN. That is, and the advancement of science. We have learned more about the science of meteorology probably since these methods were developed for investigating the upper air—the free air—than we ever knew before, because it has been within only the past 20 or 30 years that means were generally available to get into the upper air with instruments. Of course, there were a few cases where manned balloons went up, but these sounding balloons and pilot balloons that we sent up can be employed in considerable numbers, and nobody is killed or hurt. The balloon goes up with an instrument. Once in a while we lose the instruments but not often.

Mr. JONES. As a general rule, about how far away from where they started does that instrument drop?

Mr. MARVIN. The distances vary; sometimes it is 200 or 300 miles, sometimes it is less. And a peculiar feature about it is the high percentages of returns that we get.

Mr. McLAUGHLIN of Michigan. What is the percentage?

Mr. MARVIN. I am hardly prepared to say in figures. Eighty-five per cent, I should say. We expect at least 90 per cent of recoveries over the United States.

Mr. JONES. What is the value of the instrument?

MR. MARVIN. The instrument costs us about \$100 at the present time, I think. We used to get them for about half that amount, but the instrument at the present time costs a great deal more than it used to.

MR. PURNELL. How long before that information is available, if the balloon goes up several miles?

MR. MARVIN. That information is not information that we can use telegraphically. It comes in a day late or several days late, but it serves to coordinate the surface observations of the conditions when that observation was made with the conditions in the free air.

MR. PURNELL. I would like to know what particular value that information would be after it is recovered four or five days after the experiment is made?

MR. MARVIN. It tells the meteorologist what the conditions in the air were when he had certain conditions on the surface of the earth. Suppose we knew nothing about the atmosphere at all, except what we could observe at the surface. We are unable to determine the great motions of the atmosphere and the phenomena going on in it without the ability to explore the free air. Now, even if it takes us several days to make an investigation of that kind it has a bearing on the information which is before us to-day in regard to surface conditions, because it enables us to understand and interpret those surface conditions more fully and intelligently.

MR. JONES. You and I and the rest of us here—suppose we are out in the field to-day; we know it is a drizzly, foggy morning; you send up your observation balloon and two or three days it comes back and convinces us that it is foggy that morning. What benefit is that?

MR. MARVIN. We want to know why it is foggy. If we understand why it is foggy, we know a good deal more about it than we would to know simply that it was foggy. Now, it may be that these instruments will show that in a certain condition of the air the temperature was very abnormally distributed and that that foggy condition was the result of that abnormal distribution of temperature, and that that abnormal distribution of temperature was due to the overflow of winds from some particular condition of the atmosphere which we could see on the surface. It might have been the overflow from an area of low pressure or something of that sort; and it is the knowledge of the complete system of circulation in the atmosphere that we are trying to get at by means of these observations.

MR. JONES. We can understand that phase of the knowledge part of it; what we are trying to get at is the benefit to be derived from it.

MR. MARVIN. The knowledge of the laws of the circulation of the atmosphere is the thing that enables the forecaster to make his predictions. If he is ignorant of the fundamental principles governing the motions of the atmosphere, he is at a loss to make an intelligent forecast.

MR. PURNELL. Isn't the science developed far enough now so that you are able to determine those things without this?

MR. MARVIN. Mr. Purnell, we feel that we have done a good deal, but we feel we have not reached the limit. The science of meteorology is a most difficult and complex science, because the phenomena of the atmosphere occur on such a gigantic scale. I can not take here in

the laboratory a piece of the atmosphere and make any approach to studies of the circulation of the air, of the systems that we have to deal with in making the forecast. Those systems of circulation cover thousands of miles in diameter, and we don't know what the conditions are in the vertical altogether. We are trying to find out by these means what the conditions are in the vertical. We have hundreds of pictures on the weather map as to what they are at the surface, but we are coordinating those surface conditions with the free air conditions at the same time. It is an important contribution to the science of meteorology, and it also enables us to aid those engaged in aviation by telling them the kind of flying conditions they are going to encounter when they go up into the air in the different strata.

Mr. RUBEY. We have a mail route from here to New York and one from New York to Cleveland and one from Cleveland to Chicago. Are those aviators getting information from your department from day to day?

Mr. MARVIN. I don't think they make a flight without knowing what our forecast is. We give it to them every day.

Mr. RUBEY. For instance, they leave here at 10 o'clock in the morning; before they leave do they get from your department the weather conditions and atmospheric conditions between here, say, and Philadelphia and New York?

Mr. MARVIN. Yes, sir; We give them the flying conditions, the visibility, and the currents of air that they are likely to encounter.

The inauguration of this work, gentlemen, was taken up in November of 1918 with Gen. Kenley, then director of military aeronautics, and forecasts began to be furnished the military service and for the flying operations every day in the regions where they were flying at that time. Under the present administration of the Air Service of the Government under Gen. Menoher, the present Director of Military Aeronautics, we have extended that system quite a bit. We have divided the United States into 13 zones. Mr. Chairman, I would like to have you examine these charts [submitting charts]. These are the zones in which we are making observations and furnishing forecasts.

The CHAIRMAN. Will you kindly go into details as to this chart and the different zones, in order that it may appear in the record?

Mr. MARVIN. Here is one more sheet that I will ask you to examine, and which shows on a small map of the United States the location of the present stations of the several kinds, also of those we desire to establish and maintain with the increased funds requested. The other map shows that as a mere matter of convenience we have divided the United States into 13 zones, so that we may say to the Air Service, for example, "For zone 2, good flying weather to-day; generally clear sky and good visibility; moderate varying winds, surface and aloft." Every day we supply to the Director of the Air Service forecasts for these zones, and they send them to their pilots wherever flying is in progress.

Mr. JONES. These boundary lines of the zones are arbitrarily drawn?

Mr. MARVIN. They are purely arbitrary. We might have a dozen or less.

Mr. JONES. Then you are apt to get the same conditions in part of zone 1 as you do in parts of zone 2?

Mr. MARVIN. Yes, sir; the forecasts would be similar in that case. Or we sometimes say in the northern portion or the southern or the eastern or western, etc.

These forecasts are sent to the Air Service every day. As I was going out this morning at the recess I met an officer in the Air Service. He had been before the Military Committee, and he said to me, "We were just telling the committee how valuable the work was that the Weather Bureau was doing in regard to aviation." That was rather gratifying to me, and we had some pleasant words about the matter. I can assure you that this service is sought for by the Air Service. It is needed by the Air Service to conserve the lives of the flyers and the property employed in aviation.

Mr. PURNELL. What has been the practical effect of it? Has it proven to be effective and valuable to the flyers?

Mr. MARVIN. I believe so. I have no statistics to show just how good it is. When they wanted to make a trans-Atlantic flight, the very first thing was weather conditions, and the Secretary of the Navy asked the Secretary of Agriculture to have the Weather Bureau help them out on that proposition. We obtained the cooperation of Great Britain to furnish certain reports from overseas and we furnished that information.

I might say that the start of the flight awaited the advices of the forecaster. He told them when to go on that trans-Atlantic flight. He told them the conditions that they were going to encounter. It proved that those conditions were almost identical with what they did encounter.

Mr. HARRISON. I suggest that you tell the committee what the Secretary of the Navy said about the flight of the *R 34*.

Mr. MARVIN. The same thing is true of the British dirigible. When that came over here that great craft was anchored there in the open air on Long Island. The weather conditions were exceedingly important to that airship. We took special observations at different times of the day, and furnished the reports to the officer in command in order that he might safeguard his craft. Finally we sent word to the commander that we advised him to leave at a certain time if he wished to escape a severe storm that was approaching. He left at midnight, if you will remember, and safely accomplished his get-away and the trans-Atlantic flight. The Secretary of the Navy wrote a letter—I haven't it with me—expressing his appreciation of the valuable service that had been rendered to the Navy and to the British people cooperating with us at that time. I will insert it in the record.

NAVY DEPARTMENT,
Washington, July 18, 1919.

From: Secretary of the Navy.
To: Chief of Weather Bureau.
Subject: Visit of R-34.

1. The work done by the Weather Bureau before, during, and after the visit of the British dirigible *R-34* has been keenly appreciated by the Navy Department, and by the British officers connected with this flight. The reports received were most reliable, and the last report sent by Maj. Bowie on the evening of July 10, undoubtedly was the prime agent in the safe departure of the ship.

JOSEPHUS DANIELS.

Now our regular daily aviation forecasts are valuable too, because they tell us so—I haven't the statistics that will unequivocally prove that, perhaps, but there isn't any question in my mind that it is a bad proposition for any considerable flying to be undertaken in this country without advices from the Weather Bureau. It is important to the shipping of the ocean that they should seek the information of the Weather Bureau as to the state of the sea over which they expect to sail, how much more important is it to the aircraft that they await the advices that we are able to give them before they venture out and risk everything—risk disaster?

Mr. RUBEY. Can you tell us what they are doing in England and France along this same line?

Mr. MARVIN. The meteorological service in England is in the air service.

Mr. McLAUGHLIN of Michigan. Right along that line, we have the Air Service in the Army, the Air Service in the Navy, and the Air Service in the Post Office Department. Shouldn't something be done so that there won't be a duplication of this work, and some agency take hold of it for all of them?

Mr. MARVIN. That is just what I wish to do, Mr. McLaughlin. As I said in my previous remarks, there should be one and only one meteorological service. We are serving the entire country. The Air Service of the Navy and the Army are willing that we should do this work if we will only do it, but we can not do it without an appropriation. They are not doing it because they are waiting for us to do it, and this estimate of increase is for the purpose of the Weather Bureau doing this work. We have the skeleton organization and the stations and arrangements by which we can collect this information, prepare the forecasts, and issue the advices and warning and information. We have all the organization for that; all we require is some additional funds that will enable us to make the extensions to our existing organization to do this new and additional work.

The CHAIRMAN. Are we to understand, then, that this is at the request of the Army and Navy?

Mr. MARVIN. Yes, sir.

The CHAIRMAN. That this service be extended in this way?

Mr. MARVIN. They cordially support this extension.

Mr. McLAUGHLIN of Michigan. Aren't they building up services of their own, each one of them?

Mr. MARVIN. I don't think so, gentlemen. If the Weather Bureau is strengthened in this work, I don't think you will have any trouble from any other department wanting to do this work.

The CHAIRMAN. Does this come at the suggestion of the two departments?

Mr. MARVIN. Not officially; no, sir. There is an interdepartmental committee on which there are representatives from the Army and Navy and the Signal Corps and the Weather Bureau. These bureau representatives support me in these increases in my estimate, and the taking over of that work; and the object of this interdepartmental committee or board is for the purpose of coordinating and making this work effective between the various departments, so that what the Weather Bureau does will be suitable for and will supply the needs of the other bureaus.

The CHAIRMAN. What assurance can we give the House that there will be no duplication of this work?

Mr. MARVIN. There is no authority of law, Mr. Chairman, for anybody else to do it.

The CHAIRMAN. I understood you to say that it was the suggestion of the other departments that this work should be carried on by you and by no other bureau or department.

Mr. MARVIN. As I understand the authority of law in this matter, it is this: The Weather Bureau has adequate authority under the organic act, which I read into the record this morning. During the war the President by proclamation assigned to the Chief Signal Officer the responsibility of developing the meteorological work in the Army. The Chief Signal Officer operates under that authority at the present time and we are in close cooperation. So far as I know, the Air Service is not making any meteorological observations. The Navy is conducting certain meteorological observations at naval base stations. I think at only two or three at the present. As stated, the Weather Bureau gets the observations.

The CHAIRMAN. Then that work is carried on in three different branches of the Government?

Mr. MARVIN. The pilot balloon observations are made by the Navy and Army at the present time. That is not a duplication, however, Mr. Chairman. I wish to make it clear that there is no duplication, because we do not have a station where they have a station. You can see by the little red dots on the map that they have stations in certain localities, which do not duplicate but supplement our stations.

The CHAIRMAN. It is carried on in three distinct branches?

Mr. MARVIN. To a certain extent that is true.

Mr. McLAUGHLIN of Michigan. And I thought it was your purpose to have a station at each one of their stations?

Mr. MARVIN. No, sir.

Mr. McLAUGHLIN of Michigan. It says that about 20 Army stations here.

Mr. MARVIN. Those are operated by the Signal Corps.

Mr. McLAUGHLIN of Michigan. This says that through the cooperation with the Signal Corps, the Weather Bureau has inaugurated a limited forecast and warning service regarding upper air conditions at about 20 Army stations.

Mr. MARVIN. That is a service of information and weather advices that we render these stations at the military posts. The observations are made by their men and telegraphed to us. We give the advice based on all our observational data. As I said a moment ago, there are now 12 Army posts. The number has been reduced since we prepared the estimates.

Mr. McLAUGHLIN of Michigan. Tell us why it would not be advisable to have your station at the flying station.

Mr. MARVIN. The ultimate thing will be to have a pilot balloon station, either at a flying field or near a flying field, according to where it is best located to get the information we want. It is not necessary in order to make forecasts that the stations be at the field exactly, but near there.

Mr. McLAUGHLIN of Michigan. To serve that field?

Mr. MARVIN. To serve that locality. The small map in front of you, Mr. McLaughlin, shows approximately, by the symbols, where the stations are at the present time and where we expect to put new ones.

Mr. LEE. That is where they have permanent stations?

Mr. MARVIN. Our stations will be permanent. We will not put any stations where an Army or Navy station exists, or would be placed. Our stations will be only at places that we properly occupy. The cooperation of the service operates to utilize stations at other places which the Army and Navy maintain, at Pensacola, and a few coast stations which the Navy may occupy. We would not put a station at Pensacola, for instance, but the observations supplied by the Navy station at that base are very valuable to us and necessary.

Mr. McLAUGHLIN of Michigan. Now, these aircraft are going to start from a certain station, and it would seem to me that it would be advisable for them to know—if it is necessary for them to know at all, and, of course, it is from what you say—I would think that they would want the information as to conditions there.

Mr. MARVIN. That is just what we give. We do not have to have a station at every place to which we send forecasts. We have 200 stations now which show the conditions over the whole continent, and we don't ask for any additional stations covering the general surface condition.

We now have only 11 of these pilot balloon stations. We want to add 25 more. You can see that that doesn't cover the country very extensively, but we need stations in the far West to cover zones and fields in which flying will be conducted.

The CHAIRMAN. Professor, I take it that the practical and economical thing to do would be to bring all of this under one head. Are we to understand that this service is to be conducted by your bureau and also continued by the Army and the Navy; or did you come to some agreement as to who shall conduct this service?

Mr. MARVIN. I think the agreement—the understanding—is that the Weather Bureau should do the work.

The CHAIRMAN. It seems to me that you could get together and agree as to who shall be charged with this service.

Mr. RUBEY. The only way to get at that would be to find out whether the Army is going to ask an appropriation for this work and whether the Navy is going to ask for it and whether the Post Office Department is going to ask for it; and if they are not going to ask for it and are willing it should be done by the weather Bureau, that would probably settle it.

The CHAIRMAN. I am frank to say that, unless we can know, we will cut out this appropriation. We can not consent to the setting up of duplicate services in each department of the Government.

Mr. HARRISON. I think it ought to be pointed out that this appropriation was originally suggested by the National Advisory Committee on Aeronautics, composed of representatives of all these agencies appointed by the President under authority of law.

Mr. MARVIN. It started in that way originally.

Mr. McLAUGHLIN of Michigan. What committee did you say?

Mr. HARRISON. The National Advisory Committee on Aeronautics, appointed by the President in compliance with a provision in one of the appropriation bills.

The CHAIRMAN. It seems to me there should be sufficient cooperation between the different departments of the Government to settle such a question.

Mr. MARVIN. I think the question is settled, practically.

The CHAIRMAN. Have you a definite understanding?

Mr. MARVIN. This interbureau board is entirely in accord as to the Weather Bureau doing this work.

The CHAIRMAN. We are taking up a lot of time. I suggest that you take the matter up with the other departments. If you come to an agreement, we will give it consideration; but I take it that, until you do, we will hardly appropriate funds for two or three different departments to carry on the same work. It goes without saying that it would be a proper policy, or at least economy, to do that. We will pass this for the present.

Mr. JONES. The other departments have made a book of estimates, haven't they?

Mr. MARVIN. I don't know of any provisions in any other department for work of this character.

Mr. JONES. Have you examined them?

Mr. MARVIN. I have not. Mr. Chairman, item 58 is new language and a new appropriation. It reads: "For the establishment and maintenance of special stations in national forests and elsewhere, the collection of reports and the issuing of forecasts and warnings in connection with the protection of forests from fires, in cooperation with the Forest Service, State and other organizations, including salaries, travel, and other expenses in the city of Washington and elsewhere, \$15,000."

Several years ago it was found that the reports of the weather bureau in the West could be made very valuable in the prevention and suppression of forest fires.

Mr. McLAUGHLIN of Michigan. How?

Mr. MARVIN. By sending out in advance to the foresters, fire wardens and others warnings of the weather conditions that were favorable for the spread and inception of forest fires. During rainy weather and wet seasons there is little danger of forest fires, but when the weather becomes dry and droughty and hot, and the winds spring up and blow firebrands about, and where logging operations are carried on, it starts and spreads conflagration. The people in the Northwest, the lumber interests in the Northwest, went to our Oregon men to know if they could not give them advices in advance in regard to where the unfavorable conditions of weather would be. They took the matter up and worked up a service on that basis, and that has been in operation under scarcely any appropriation—it is like these other things that I said the weather bureau did every now and then to help out, up to the limit of our ability. That was done very successfully. A year or so after that, we asked Congress to give us an appropriation for this matter, and it was included with some other estimates. Half of the amount we asked for was granted, but the language in regard to the fire-fighting work was omitted, and we have felt that we were not justified in spending any considerable amount on the work.

We would have taken this matter up two or three years ago more vigorously if it had not been for the war conditions. Now it

seems that we must bring this matter up at the present session because the work is so greatly needed.

Mr. McLAUGHLIN of Michigan. It is difficult for a layman to question or cast out on statements by you scientific gentlemen, but you speak of dry conditions under which fires are produced. Fires come generally and naturally, I would suppose, after a long-continued dry spell. It would not seem to me that it would take any weather observations or scientific investigation to disclose that condition when it comes and prevails for a long time. Fires come then, and it doesn't do any good to foresee it, does it?

Mr. MARVIN. I think it does. Resolutions have been passed on numerous occasions by forestry and fire-fighting associations of the West, recommending increased appropriations for this service. The extensive and destructive forest fires that prevailed this summer in the Northwest emphasize the need for this service and its extension. The value of the service is shown by a letter from the chief fire warden of the State of Washington, if you will permit me to read it, dated Seattle, Wash., August 11, in which he asked to have it arranged that telegraphic warnings of fire weather conditions be sent to some 200 or 300 logging operators in the logging camps under the supervision of the association. He says that more than one-half of the fires reported for this year have occurred in logging camps, and that the only way to prevent these fires is to cease operating fire-emitting engines during extremely hazardous weather. The plan is to advise the operators that telegrams will be sent them advising them of the approach of dangerous conditions and suggesting that they close down upon the receipt of these advices.

Mr. JONES. I can not agree to the statement that one-half of the fires reported this season have occurred in logging camps.

In the first place, the lumbermen themselves are more interested in the prevention of fires than any other class of people; and the fires in the forests are started by hunters and campers, 95 per cent of them. That is true in the Adirondacks, and I think it is true everywhere else where hunters and campers assemble.

Mr. MARVIN. We are performing this service to a limited extent at the present time. Here is one of the cards that we send out [indicating]. That is part of the service. This gives the forecast of the conditions where forest fires are likely to be aided by weather conditions and contains cautions against the production or starting of forest fires and solicits cooperation. There is educational work on this card for the use of campers, excursionists, logging men, and everybody to whom these things will be distributed. The object is to get hold of the excursionists and the campers. We place admonitory words there.

Mr. JONES. I think that [referring to the forecast card] is correct. That is the reason of the fires, too, the reason set forth there as the cause of the fires.

Mr. MARVIN. Now, I am not advocating anything in my own behalf at all. I am simply trying to satisfy the demands that are made upon us.

We have on file also a letter from Hon. Burton L. French, representative from Idaho, to the Forest Service, together with a copy of the acting forester's reply, urging that funds be set aside for the

use of the Weather Bureau in connection with weather forecasts and forest fire work. In transmitting this correspondence to the Weather Bureau, the Acting Forester says:

The Forest Service will appreciate any favorable consideration which can be given by you to the suggestion made by Mr. French as to the inclusion of a \$10,000 item in the appropriation estimates for the fiscal year 1921 for forecast work in Montana and Idaho and Oregon, with special reference to forest fires. As you know, the present season is one of the worst which has been experienced since the national forests were taken in under the administration of the Forest Service, and the expenses this year convince me that accurate weather forecasts would be of great assistance in shaping an organization for the prevention and suppression of forest fires.

The amount named by Mr. French, \$10,000, is insufficient, under present conditions, and we are asking that the amount be set at \$15,000.

The CHAIRMAN. Who is that from?

Mr. MARVIN. Hon. Burton L. French, Representative from Idaho.

The CHAIRMAN. Is that to establish a new station?

Mr. MARVIN. The purpose of this?

The CHAIRMAN. This \$15,000 item?

Mr. MARVIN. The \$15,000 is to enable us to put in certain instrumental equipment of a limited character for measuring wind velocity at forest stations, under care of the Forest Service and under care of the State forestry organizations. We pay no salaries for any of the information furnished.

The CHAIRMAN. It reads:

For the establishment and maintenance of special stations in national forests and elsewhere.

Does that mean the establishment of new stations?

Mr. MARVIN. Not new stations from the point of view of the big city stations. We simply put in an anemometer and a wind vane, perhaps.

Mr. JONES. Where will these operations be placed?

Mr. MARVIN. They will be placed where they are making these fire observations. At lookout stations and where they give useful information and where they can be cared for by men already there.

Mr. JONES. Fire control posts?

Mr. MARVIN. Yes, sir; and these men will give us the readings. The readings will be telegraphed into our forecasting offices, and the information will be put on the weather map or charted otherwise in order to aid the forecasters in determining the localities in which these warnings should be issued, and the nature of the warning. We will then distribute the information to those regions where it is most dangerous.

Mr. JONES. Isn't there telegraph and telephone service now where each of these fire wardens is located under forestry protection?

Mr. MARVIN. Yes, sir; and because of the existence of such means of immediate communication we can administer this service.

Mr. JONES. Isn't their telegraph and telephone service taken care of in their appropriation? You ask for telephone and telegraph service in connection with this \$15,000.

Mr. MARVIN. Any messages going over their lines is free, and none of the money would be spent in that way, but the message must go from the terminus of their lines into our system through

commercial lines to reach us; and it is that service for which we must pay.

Mr. JONES. To give you a concrete example, the fire warden on top of a certain mountain, for instance in the Adirondacks (he is placed there under the supervision of the State Department of New York); he has got his observation station there and stays there throughout the dry season; with his telescope he can look all around the surrounding territory; if he sees a fire start or smoke emanating from some particular place he phones to the nearest available point and says there is a fire in such and such a lot and such and such a territory. How will this service of yours aid him in the stopping of that fire or putting it out in case it does start?

Mr. MARVIN. It would not aid him in stopping that fire, possibly. The value of warnings of the production of forest fires would enable the fire wardens to observe the greatest precautions in those districts which were the most threatened. Now, after a fire has started it may become a question of when it is going to rain and help put out the fire; that is all included in our forecast.

Mr. JONES. When they see a fire they will put it out and not wait for rains.

Mr. MARVIN. They may not wait for rains, but it would be of much value to them.

Mr. JONES. They might have to wait three or four days.

Mr. MARVIN. Of course, but it is of value to them to know what is coming, and that a rain coming in a certain section. The forecasts of coming rains in the dry season are of value without fires.

Mr. JONES. They will not wait for a rain.

Mr. MARVIN. They may not wait for a rain; the fire may burn until the rain helps to stop it. At any rate, this is represented to us by these people as a useful service that we ought to render.

The question is, What are we going to do about it? There is no other agency of the Government that has the organization to do this and it can not be done otherwise. It is simply a question, Are we to do it or let it go undone? As I said a moment ago, it is a thing that grew up several years ago. If the associations in the West interested in forest conservation are asked, they will testify to the value of the services we have already rendered. I think this letter from the Chief Forester indicates that, and as I say, it is a question whether the bureau is to be furnished with funds to do this work or must it be left undone?

Mr. HUTCHINSON. Professor, I would like to ask you a question right here. I see in the table below here you have "special observers, from \$1 to 50 cents per observation." I would like to know if the observer that gets this enormous salary of \$1,260 can get that?

Mr. MARVIN. No, sir; the "special observers" are private citizens who are willing to give a part of their time to do this work. I spoke this morning of 5,000 observers that we pay absolutely nothing. We give them certain publications and the like. Now, when we ask a man to prepare a telegram and file that at a telegraph office within a few minutes we are willing to pay him 25 cents per observation, and sometimes a little more, but at the maximum we can not pay that man more than \$300 a year under civil-service rules. Under that less than \$1 a day is the maximum we can pay.

Mr. McLAUGHLIN of Michigan. When he goes to a telegraph office with a telegram, what does he put in the telegram?

Mr. MARVIN. It may be the state of the wind, or the temperature, or the stage of the river, possibly; in this fire-weather work, it may be the amount of rainfall or the reading of the anemometer; in some cases it may be a cipher message to convey a lot in a few words; in that case he has a code book and must take out the words that will convey the observation. We pay a small fee for those observations.

Mr. McLAUGHLIN of Michigan. If he reports that there is a high wind, what is done?

Mr. MARVIN. He reports the reading of the anemometer, 28 miles per hour, northwest, or cloudy, or whatever may be the state of the weather; he does not tell us anything about a forest fire, or anything like that. When the forecaster receives the report the observations are entered on a map of the region and go to make up a great picture of the atmospheric conditions, and the forecaster makes his deductions and forecast.

Mr. HUTCHINSON. Right there, I want to ask if you have in your bureau any men drawing two salaries?

Mr. MARVIN. No, sir; not contrary to any law.

Mr. HUTCHINSON. Perhaps not contrary to law, but have you any?

Mr. MARVIN. I think that in proper cases the law authorizes men to receive two salaries, providing the aggregate amount does not exceed \$2,000. There are no men at the present time in the Weather Bureau receiving two compensations from the Government.

The CHAIRMAN. Was there not an order issued during the war to the effect that they might draw salaries up to \$2,000?

Mr. HARRISON. There is a law which prohibits any employee of the Government from drawing two salaries if the amounts aggregate more than \$2,000.

The CHAIRMAN. But they may draw up to \$2,000?

Mr. HARRISON. Yes, sir.

The CHAIRMAN. You have 5,000 of these local reporters?

Mr. MARVIN. We have nearly that number. The number who receive 25 cents a time for observations is roughly 1,500, I should say; that is, the corn and wheat observers and the observers on the rivers, and we pay a large number of men who make an observation and file a telegram this small compensation.

The CHAIRMAN. They are the ones who were formerly paid a yearly compensation?

Mr. MARVIN. No, sir; we never had men of that class; these men are given so much for an observation. In some cases there is a monthly wage not to exceed \$25.

The CHAIRMAN. About 5,000 of them?

Mr. MARVIN. About 1,500.

The CHAIRMAN. Altogether?

Mr. MARVIN. One thousand five hundred that receive this kind of compensation.

The CHAIRMAN. How many altogether?

Mr. MARVIN. There are 5,000 men that receive no compensation and about 1,500 this small compensation.

The CHAIRMAN. That averages nearly two to a county?

Mr. MARVIN. One to a county.

The CHAIRMAN. There are about 3,500 counties?

Mr. MARVIN. There are a few cases with two in a county.

The CHAIRMAN. And they are to continue without salaries?

Mr. MARVIN. Without salaries.

The CHAIRMAN. What have you to say about item 59? That is a new item, "For the extension of marine meteorological work, the collection of weather and water temperature reports at sea, the preparation of charts, the determining of fog zones, the distribution of marine meteorological information in the aid of navigation, and to carry out the provisions of the act of Congress approved June 17, 1910 (36 Stat. L., p. 508), for the collecting and furnishing of meteorological information to the Hydrographic Office of the Navy Department for use in the preparation of pilot charts, including salaries, travel, and other expenses in the city of Washington and elsewhere, \$50,000."

Mr. MARVIN. This is in connection with the extension of our marine meteorological work, the collection of weather and water temperature reports at sea, and the preparation of charts, etc., and like the item with reference to weather warning, it is a new item. It has been conducted in an inexpensive way for very many years. For many years the Weather Bureau has been engaged in the collection of meteorological reports from vessels at sea, the principal object of which has been to supply data required for the pilot charts published by the hydrographic office of the Navy Department, as required by act of Congress. This work has been conducted with very little expense. The observations are made under cooperative arrangements with vessel captains of ships of all nationalities. No payment is made for the observations other than for the marine information and meteorological publications furnished, and the correctness of the barometers when the ships enter ports at which Weather Bureau stations are located. The only additional expense has been for salaries of a few clerks engaged in charting and filing the data now furnished the hydrographic office. The placing of so many United States mercantile ships on the seas has created a greater demand than ever before for definite information pertaining to the surface meteorology of the ocean, which is necessary to further develop the existing service.

Employees of the Weather Bureau at stations located in important seaport cities must visit ships and confer with vessel masters and enlist cooperative reports, check instruments, and supply observers with information. Maps and bulletins must be prepared and issued containing the current meteorology of the ocean as far as possible, especially the great highways and lanes of marine travel, in order to make available accurate information as to stormy regions and occasions. Up to the present time, masters of vessels have provided their own instruments, and experience shows that observations are often highly inaccurate. However, it is not the purpose of the Weather Bureau to supply instruments to vessel masters, except possibly in the case of a very limited number of selected ships plying waters where data are now deficient or entirely lacking, or where vessels render reports by wireless in important regions. Recent scientific studies of these matters lead to the conclusion that the surface-water temperatures of the ocean exert an

influence on the weather of coastal regions. Because of the slow changes in water temperatures the necessary information has a forecast value with reference to the future weather conditions. In special cases the ocean conditions may justify a forecast several weeks in advance. The present project will contribute in an important way to this and like studies.

The object of this is to extend our domain over the ocean and rehabilitate the conditions that existed before the war. Before the war the vessels of all the nationalities of the world were furnishing us with reports by mail; they come in by mail when the vessel reaches port. The observation is made by the masters of the vessels, who receive no compensation. During the war the ships were withdrawn from traffic, and England especially withheld permission to furnish reports and we lost most of our observational work. We are now striving through the marine agencies at ports of entry to rehabilitate this service and extend it. The Shipping Board has extended its good offices to us in encouraging the masters of vessels to furnish information to us, and the information we are able to give to them is sufficient to justify them in taking an interest in the work, the best that can be done. The other nations will come in on this and ships of foreign nationalities will furnish us information in exchange for the information we give them. We intend to develop a map, issue especially to show weather conditions over the great lanes of travel of the North Atlantic. Forecasts will indicate what kind of weather they are going to encounter on their various trips. These requests are made to us, and it is our effort to supply that information. Our law requires us to perform our service for the benefit of navigation and we are now undertaking to do that in this way.

Some of this upper air work will be extended over the ocean. You have seen during the past summer the Atlantic Ocean has been navigated twice by aircraft, and it is impossible to anticipate what will happen in the future in regard to oceanic aerial navigation.

Mr. McLAUGHLIN of Michigan. You have taken care of that in another item.

Mr. MARVIN. Of the upper air work, yes. This is for the surface conditions of the oceans from ships' reports. In the course of the next few years the ocean will be covered by many ships from all points, and if each makes an observation once a day and makes a report on arrival at port we can chart those observations in conjunction with like reports from vessels at other points. Thus we have a picture of the meteorological conditions on the ocean.

The CHAIRMAN. Are we to understand that this is a transfer of activities from the Navy Department?

Mr. MARVIN. No, sir.

The CHAIRMAN. The notes read, "Up to the present time masters of vessels have provided their own instruments, and experience shows that observations are often highly inaccurate."

Mr. MARVIN. In some cases instruments are inaccurate.

The CHAIRMAN. Is the Navy doing any of this work at the present time?

Mr. MARVIN. No, sir; the Navy, of course, is not occupying the ocean except in a very incidental way. During peace times they may

patrol the coast, or go out on manouvers, but the number of merchant ships on the ocean is far in excess of anything the Navy could do. The Hydrographic Office prints a map of the ocean on which the average weather conditions are shown.

The CHAIRMAN. Is the Hydrographic Office doing anything of this kind now?

Mr. MARVIN. No, sir; the law provides that we give to them the results based on the information we receive.

Mr. McLAUGHLIN of Michigan. You spoke of reports made by masters of vessels after they reach ports telling of the kinds of weather through which they passed on the voyages.

Mr. MARVIN. The observations give us the pressure of the air, the temperature of the air, the temperature of the water, the direction of the wind, and the cloudiness and all those particulars, the same as we observe at our continental stations.

Mr. McLAUGHLIN of Michigan. What good will that do you for the future?

Mr. MARVIN. It is a case of understanding the great question of the circulation of the atmosphere; of the laws governing the changes in weather from day to day. These daily weather maps we construct give us a picture of the atmospheric conditions over the land. We know little of what conditions are over the ocean on any given day except as we go out there and observe them.

Mr. McLAUGHLIN of Michigan. Are those conditions ever twice alike?

Mr. MARVIN. Hardly ever. When the trans-Atlantic flight was planned we went into the past records and we examined map after map, both from Newfoundland direct to Ireland, and from Newfoundland to the Azores, to Portugal and England. We gathered all the information we could in regard to the atmospheric conditions on the ocean, and that was drawn upon to aid in the advice to the Navy in planning that flight. A paper has been published setting that information forth, and it enables us to formulate an opinion on certain conditions which favor or prevent a flight of that character. Now, we must wait until conditions come which are favorable. We have to wait, and we gave the Navy information at Trepassey Bay when to start. They had to wait several days and we gave them information and it could not have been done without the information we had collected during long past years. We do not want to stop now; we want to continue that collection of information.

Mr. McLAUGHLIN of Michigan. How do you justify the purchase of these instruments and the gift of them?

Mr. MARVIN. We do not purchase them and give them away.

Mr. McLAUGHLIN of Michigan. There is something about that here.

Mr. MARVIN (reading):

However, it is not the purpose of the Weather Bureau to supply instruments to vessel masters except possibly in the case of a very limited number of selected ships plying waters where data are now deficient or entirely lacking or where vessels render reports by wireless in important regions.

There is a qualification there.

The CHAIRMAN. Why should you furnish any of these vessels with instruments?

Mr. MARVIN. Mr. Chairman, if we knew there was a vessel plying far north in the Atlantic, for example, we might consider it a very proper investment to lend the master a barometer worth \$25 or \$30 to get that information, because there are very few vessels go into that region, and we would like to have that exception made so that we could furnish a few instruments in some cases. We do not expect to furnish instruments in any considerable number of cases.

The CHAIRMAN. If that is all, let us hear something about the remaining item, No. 6, which reads as follows:

"The Secretary of Agriculture shall cause the premises known as Mount Weather, situate at Mount Weather, in the counties of Loudoun and Clarke, in the State of Virginia, and comprising 84.81 acres of land, more or less, together with the buildings and other improvements thereon, including laboratories, cottages, sheds, stables, shops, heating and power plant, kite shelter, and other buildings of whatever nature, together with all the rights, easements, and appurtenances thereto belonging, to be sold at public sale and conveyed to the highest bidder for cash, first having given not less than 30 days' public notice of the time, place, and terms of sale immediately prior to such sale, by publication in at least two newspapers having a general circulation in the county or sections of the counties where the premises are situate; the net proceeds of the sale, after deducting the expenses incidental thereto, to be turned into the Treasury as miscellaneous receipts."

Mr. MARVIN. The only remaining item is for language in the appropriations to authorize the sale of Mount Weather.

The CHAIRMAN. How much money has been expended at Mount Weather?

Mr. MARVIN. In response to action by the Congress in 1914, I think a statement was submitted showing the original cost to the Government of the properties and improvements made at that place; a complete outlay of \$209,581.70. There were \$28,000 used in replacing one building which was destroyed by fire, a balance of \$181,581.70.

The CHAIRMAN. What building was that?

Mr. MARVIN. The original observatory building, a stone building, originally occupying the site of what is now the main building. The large building replaced the stone building destroyed by fire.

Mr. McLAUGHLIN of Michigan. The Government does not carry insurance on any property?

Mr. MARVIN. There was no insurance on that property.

The CHAIRMAN. Can you describe which building it was? I was up there last year.

Mr. MARVIN. The brick building with the large columns.

The CHAIRMAN. Is \$28,000 all that building cost?

Mr. MARVIN. No, sir; that is not the cost of the building itself, but that was the cost of the building originally there that was lost.

The CHAIRMAN. What is the cost of the building that is there now?

Mr. MARVIN. That cost \$49,848.98.

Mr. JONES. When was that burned down?

Mr. MARVIN. The original building was burned in 1907, I think.

The CHAIRMAN. What is the cost of the upkeep of the place now?

Mr. MARVIN. In 1914 we removed all of the activities from that station, except certain observations, and placed the property in the hands of a caretaker at a cost of—I think we are paying \$1,400; this statement does not show that. We have a man in charge temporarily of the property, and he is making certain observations for us.

We removed all the activities from that station, after having been in operation several years, and I wish to say this, that we hardly

could have foreseen the value which the observations and data collected at that station came to have during the war. They were almost the only observations made in this country in the upper air, and that gave us the first data to answer the inquiries in relation to the upper air to military departments.

Mr. JONES. I would like to have a little history of it; this is all new to me, and I would like to know why was it established, and what was done with it, and why was it disbanded?

Mr. MARVIN. The history of that institution would be a very long one, but briefly it amounts to this: The Chief of the Weather Bureau in 1902 bought a tract of ground up there for the purpose of erecting a laboratory and a scientific institution to pursue a number of lines of work and put up a number of buildings. That work was carried on for a number of years. In 1909 we began to carry on the kite and balloon work there. During that time a number of buildings were erected. Some were used for magnetic observations. Other buildings were designed for investigations in meteorological physics.

The CHAIRMAN. Mr. Harrison has a copy of the report made by the secretary to the Speaker which gives full information. What is the committee's wish as to inserting it in the record? [After some informal discussion by the members of the committee.] We will have the report incorporated in the record.

(The report referred to follows:)

DECEMBER 9, 1914.

THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

SIR: Pursuant to the instructions contained in the act of Congress approved June 24, 1914 (Public No. 122, 63d Cong., H. R. 13679), entitled, "An act making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1915," viz:

* * * * *

"The Secretary of Agriculture is hereby directed to report to Congress at its next session the present condition and value of the tract of land consisting of eighty-four and eighty-one one-hundredths acres of land, more or less, known as Mount Weather, and located in the counties of Loudoun and Clarke, in the State of Virginia, the original cost of said land, together with the cost of the improvements thereon and the present value of such improvements, the amount which in his opinion can be realized from the sale of said real property, including buildings and other improvements, at private sale, and whether in his opinion it would be most advantageous to sell the same at public or at private sale, and to advise Congress as to whether it would be better for the Government to sell said property or to lease it. And the Secretary of Agriculture is authorized, in his discretion, to discontinue the use of Mount Weather as a weather station and if necessary place a keeper in charge thereof for its protection and care, the expenses thereof to be paid out of the appropriation made herein for necessary expenses of the Weather Bureau outside of the city of Washington."

* * * * *

I have the honor to report, as follows:

Description of property.—Mount Weather (Virginia) is the name given a group of buildings erected by the Weather Bureau for special aerial and research work on top of the Blue Ridge Mountains in Loudoun and Clarke Counties, about 20 miles south of Harpers Ferry and 47 miles in a direct line west of Washington. It is 6 miles south of Bluemont, Va., the nearest railroad station and present terminus of the Washington & Old Dominion (suburban electric) Railroad line. The grounds have an area of 84.81 acres; are roughly square in outline, lying on both sides of the ridge, the top of which is 1,725 feet above sea level, and about 1,200 feet above the valleys on either side.

It overlooks to the west the entire Shenandoah Valley from Strasburg to Harpers Ferry, and to the east all that portion of Piedmont-Virginia Valley between the Blue Ridge and the Bull Run Mountains.

Original cost to the Government.

Land, first purchase of 67.25 acres (September, 1902)-----	\$1, 863. 15
Land, second purchase of 17.56 acres (September, 1903)-----	650. 00
Total cost of land-----	2, 513. 15

Buildings and improvements.

Administration and observatory building, erected 1909; brick, tile, and concrete; three stories and cellar; 18 rooms; cost-----	\$49, 898. 41
Machine shop and balloon shed, erected 1904; two-story frame and stone building; 8 rooms; cost-----	8, 817. 00
Central heating and power plant, erected 1909; one-story stone building; boilers and electrical equipment sufficient for supplying heat, light, and power for the entire plant; cost-----	11, 964. 74
Absolute building and variation building (for terrestrial-magnetic work), erected 1906; 2 one-story frame buildings, used in connection with investigations in terrestrial magnetism; cellar under each; the walls are about 4 feet thick, of double construction, packed with sawdust to secure constant temperature conditions within; cost-----	15, 904. 55
Stables: 1 two-story frame and stone stable and 1 two-story frame stable; cost-----	2, 800. 00
Farm cottage for dwelling purposes, remodeled 1905; a two-story frame building; 9 rooms; cost-----	1, 300. 00
Physical laboratory, erected 1909; three-story stone building; 16 rooms; cost-----	37, 521. 51
Cottage for dwelling, erected 1909; three-story frame building; 15 rooms; cost-----	11, 246. 34
Reel house and kite shelter; a circular frame building, 9 feet in diameter; cost-----	1, 738. 69
Repairs and permanent improvements-----	37, 823. 31
Administration building destroyed by fire; cost-----	28, 000. 00
Total cost to the Government-----	209, 527. 70

Or, omitting fire losses (\$28,000), original cost remains----- 181, 527. 70

Most of the buildings are new, or have been maintained in thorough condition of repair. The present valuation is, however, placed at 60 per cent of original cost, or approximately \$108,000. And, including \$4,250 for the grounds, gives a total of \$112,000.

PRESENT CONDITION AND VALUE.

Grounds.—Condition, as a whole, excellent. More than one-half the tract is rocky, covered with trees and shrubs, and not suitable for any agricultural purposes except grazing; remainder cleared and about one-half acre is utilized for growing garden truck; etc. Ground improvements consist of some clearing of trees and underbrush; laying out and constructing necessary roads and driveways. Latter, about the upper part of the grounds, have been built of crushed stone in good substantial manner, and connect with the public highway, county road, from Bluemont.

Entire tract well inclosed, partly by a stone-wall fence and remainder by wire fencing.

Land values.—Improved lands between Mount Weather and Bluemont have been sold within the past year or so at prices of from \$40 per acre, for orchard purposes, to \$100 per acre, for summer residence sites, location and outlook adding considerably to values for residence sites.

The Weather Bureau tract is well situated for residential purposes, and is considered by those having a knowledge of local real-estate values to be worth \$50 per acre, not including, of course, the value of the improvements.

The special scientific investigations heretofore conducted at Mount Weather have been transferred to the new station established near Omaha, Nebr., and to Washington; and most of the scientific instruments and apparatus have now been removed.

The chief obstacle to our continued use of the property is the present poor condition of the road from Bluemont, affording access thereto. Arrangements

have been made, however, to continue all needful meteorological observations at Mount Weather, including preservation and care of buildings and grounds, at a cost of less than \$2,000 per annum.

The buildings and grounds have been inspected by officials of other bureaus of this department and are not found suitable for their use in any way.

The buildings are of good, durable construction, are fairly well arranged, and could be adapted for use as a summer hotel or country club, a sanitarium, or possibly for school purposes.

Whether this property should be sold at private or public sale is, we think, a question that should be left to the judgment of Congress, with a recommendation that the present valuation of the property be set at \$112,000.

Based on personal observation of the Chief of the Weather Bureau extending over the entire period back to several months before the date of purchase, it is believed the location of this property is such that neither the buildings nor grounds could be leased to advantage in any way, either as a whole or in part, and such action is not recommended.

It is also impracticable to dispose of the property to advantage at forced sale at this time, and it is recommended it be held for sale later when a reasonable price may possibly be had.

Respectfully submitted.

D. F. HOUSTON, *Secretary.*

Mr. JONES. In a few words, why was it given up?

Mr. MARVIN. After five years we found it costly to maintain it. The property is located on the Blue Ridge Mountains, about 6 miles from the terminus of the Old Dominion Railway. Supplies have to be hauled in, and the men were more or less isolated there and were not contented in the conduct of the work. We had about five years of observations at that point in the kites and balloon problems, and it was not such a good place for that kind of work, because we were too near the ocean. We could do the kite work, but some of the balloon work could not be conducted there, because the balloons would move eastward and drop in the ocean.

Mr. JONES. Was it reestablished at some other place?

Mr. MARVIN. We established a station at Drexel, Nebr., and moved equipment out there.

Mr. TINCHER. What kind of land is it?

The CHAIRMAN. It is one of the most beautiful sites in America. How many acres have you there?

Mr. MARVIN. Eighty-four and eighty-one hundredths acres.

The CHAIRMAN. What did the department pay for the land?

Mr. MARVIN. The original cost of the land was \$2,513.15. The first parcel of 67½ acres was purchased for \$1,863.15; a second parcel was purchased for \$650, or a total of \$2,513.15.

Mr. JONES. You say it is 8 miles from a railroad?

Mr. MARVIN. Six miles from the terminus of the Old Dominion Railroad.

Mr. JONES. What point is that?

Mr. MARVIN. Bluemont, Va., about 60 miles west of Washington.

The CHAIRMAN. Does the \$209,000 include the roads?

Mr. MARVIN. That includes everything.

The CHAIRMAN. Are you through, Professor?

Mr. MARVIN. I believe that is all, except in concluding I would like to say that this work we are asking money for is all legitimate work of the bureau and will help to strengthen the hands of the bureau in meeting demands made upon it from outside sources. I hope you can see it from that point. The increases are made necessary from the

fact that our appropriations stood still all during the four years of the war. We must now rehabilitate the service along all lines.

Mr. HUTCHINSON. Professor, did the war increase your activities at all?

Mr. MARVIN. Very little, except the appropriation for aerological work. That was an appropriation for \$100,000, made in the Army bill originally. That was made for investigations and experiments in aid of air navigation and the future needs of aeronautics justifies the continuation of that. Aviation is still with us, and we must still do the work to comply with a very plain requirement of our organic act.

Mr. HUTCHINSON. I notice you are asking for \$347,000 more than you did last year.

Mr. MARVIN. That is the total aggregate increase.

Mr. HUTCHINSON. That is in the items you speak of, \$20,000—

Mr. MARVIN (interposing). For aerological work.

The CHAIRMAN. The estimate carries a number of items. Will you ascertain whether the activities are carried on by other departments and furnish the committee with the information?

Mr. MARVIN. Yes, sir.

(At the suggestion of the chairman, the following letter from the National Advisory Committee for Aeronautics on the subject of the aerological work of the Weather Bureau is submitted for the record:)

NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS,
Washington, D. C., December 18, 1919.

HON. GILBERT N. HAUGEN,

*Chairman Committee on Agriculture,
House of Representatives, Washington, D. C.*

DEAR SIR: At the regular meeting of the executive committee of the National Advisory Committee for Aeronautics, held on December 18, 1919, careful consideration was given to the increasing needs of aeronautics for improvements and extensions in the making of meteorological observations in the free air and the issuance of forecasts and warnings for the promotion of the safety of navigation of the air over the land and the oceans.

The work of this character now being done by the Weather Bureau is conducted under an appropriation of \$100,000, which was originally granted by Congress in 1917 upon the recommendation of the National Advisory Committee for Aeronautics.

The organic act defining the duties and functions of the Weather Bureau clearly requires it to render this important service. The making of local meteorological observations by the Army at certain military posts and by the Navy at base stations and aboard ships is necessary for local needs, and obviates the maintenance by the Weather Bureau of stations at those points, which would otherwise be necessary,

There is no duplication of work and expenditures whatever in these activities, the work of the Army and Navy in this connection being wholly supplementary and complementary to that of the Weather Bureau, the observations being telegraphed to the Weather Bureau daily for its use in conjunction with reports from over 200 stations of its own.

Accordingly, the executive committee strongly approves of and supports the recommendation of the Secretary of Agriculture for the increase of \$200,000 requested, viz: Item (57) of the committee print of the estimates. The executive committee further unanimously authorized its chairman to address this letter to you because it is convinced that the funds requested are now necessary to enable the Weather Bureau to meet the requirements of aviation and to safeguard the lives and property employed in the navigation of the air. The members of the National Advisory Committee for Aeronautics present at the meeting referred to are:

Dr. Joseph S. Ames, chairman.

Dr. Charles D. Walcott, Secretary Smithsonian Institution.

Prof. Charles F. Marvin, Chief United States Weather Bureau.

Maj. Gen. Charles T. Menoher, United States Army, Director of Air Service.
 Lieut. Col. B. Q. Jones, United States Army, representing Col. T. H. Bane.
 Rear Admiral D. W. Taylor, Chief Constructor, United States Navy.
 Capt. T. T. Craven, United States Navy, Director of Naval Aviation.
 Gen. Menoher and Capt. Craven have expressed their desire and willingness to present their views personally to you on this matter.

Respectfully,

NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS,
 JOSEPH S. AMES, *Chairman Executive Committee.*

Activities under lump-sum items, Weather Bureau.

Project.	Allotment, 1920.	Estimate, 1921.	Increase.
Expenses in Washington.....	\$109,250	\$116,190	¹ \$6,940
Printing in Washington.....	12,800	15,000	2,200
Expenses outside of Washington:			
(a) Forecasts and warnings.....	841,620	891,120	² 49,500
(b) Agricultural meteorology.....	84,000	104,000	³ 20,000
(c) Climatological work.....	356,310	357,210	⁴ 900
(d) Seismology.....	2,000	2,000
(e) Volcanology.....	10,000	10,000
(f) Miscellaneous.....	10,300	10,300
	1,304,230	⁵ 1,374,630	70,400
Traveling expenses.....	26,000	28,200	2,200
Aerological investigations.....	85,040	⁶ 285,040	200,000
Forest fire warnings (new).....	15,000	15,000
Marine meteorological work (new).....	50,000	50,000
Total.....	1,537,321	1,884,060	346,740

¹ Includes central office administrative expenses in connection with (a) vessel service, \$5,500; and (b) dry farming observation work, \$1,440.

² Forecasts and warnings, \$40,000; vessel weather service, \$9,500.

³ Fruit frost service, \$9,000; orchard spraying forecasts, \$7,000; cattle, corn, and wheat region weather service, \$4,000.

⁴ Dry farming observation work.

⁵ Includes \$1,200 transferred to statutory roll.

⁶ Includes \$4,020 transferred to statutory roll.

The CHAIRMAN. Thank you very much, Prof. Marvin.

(Thereupon the committee proceeded to take up the estimates for the Bureau of Animal Industry.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Wednesday, December 10, 1919.

(The morning session of December 10 and most of the time of the afternoon session were given to a consideration of item No. 61, in the estimates for the Bureau of Animal Industry, for the eradication of tuberculosis of animals. The record of the hearings on this matter will be found in subsequent pages of this report.)

BUREAU OF ANIMAL INDUSTRY.

The CHAIRMAN. We will be pleased to hear from you, Dr. Mohler.

STATEMENT OF DR. JOHN R. MOHLER, CHIEF OF THE BUREAU OF ANIMAL INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. MOHLER. Mr. Chairman and gentlemen, the first item in the estimate for appropriations for the Bureau of Animal Industry will be found on page 37 of the book of estimates. This item refers to the salaries on the statutory roll. You will note that there is no actual increase in this amount, but there is an apparent increase of \$105,640, on account of the transfer of some 78 clerks, 3 skilled laborers, and 13 messengers and messenger boys from the lump sums over to this statutory roll.

Mr. McLAUGHLIN of Michigan. In each case was the transfer made at the same salary?

Dr. MOHLER. In each case the transfer was made at the same salary and the lump sum decreased accordingly.

Mr. McLAUGHLIN of Michigan. Are any additional men asked for on any of these items?

Dr. MOHLER. No, sir; and no promotions.

The next item will be found on page 42, item 60:

For inspection and quarantine work, including all necessary expenses for the eradication of scabies in sheep and cattle, the inspection of Southern cattle, the supervision of the transportation of live stock and the inspection of vessels, the execution of the 28-hour law, and the inspection and quarantine of imported animals, etc.

You will note that the appropriation last year was for \$525,000, while this year we are asking for \$557,660, which is an actual increase of \$40,020, when the transfer to the statutory roll of \$7,360 is added.

There are three items which are included in this increase. The first item is for \$10,000 increase for the eradication of scabies in cattle and horses.

Mr. McLAUGHLIN of Michigan. In certain areas in the Western and Southwestern States?

Dr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. Are those largely range cattle and range horses?

Dr. MOHLER. Largely so. The principal project under this appropriation is the regular eradication work of scabies in sheep, which is carried on in cooperation with State authorities in 21 States. In addition, assistance is lent to authorities in other States upon request when circumstances warrant. New outbreaks of this disease occurred in several of the Western States in the last two years. As the war emergency rendered it inadvisable to impose severe restrictions upon the movement of sheep to feed lots for fattening and to markets, and because of the shortage of competent personnel at that time, it was found difficult to confine these outbreaks to the original areas. The disease, therefore, attained a considerable spread, especially in the larger sheep-feeding States in the Central West, through the introduction of sheep from the range States.

During the past season intensive efforts were made by the bureau and the State authorities and considerable improvement was effected. It is important, however, that the campaign be continued so that the ground gained may not again be lost.

We have kept a complete record of the number of bands of sheep that were found affected in the central, western, and extreme western States. There were in all about 2,722 bands found infested with scabies last year, involving over 2,000,000 sheep.

Mr. McLAUGHLIN of Michigan. How much money was spent on that this year, under this \$525,000 appropriation, under this subdivision A?

Dr. MOHLER. For sheep scabies \$151,378 was allotted for the current year.

Mr. McLAUGHLIN of Michigan. This year you propose to make it \$160,000, an increase of \$10,000?

Dr. MOHLER. The increase of \$10,000 is for the cattle and horse scabies work, not the sheep scabies work.

Mr. McLAUGHLIN of Michigan. For that same work last year it was \$151,000?

Dr. MOHLER. Yes, sir. That was for sheep scabies. We are not asking for any increase on that.

Mr. McLAUGHLIN of Michigan. Under this subdivision A, you are asking for an increase.

Dr. MOHLER. The \$10,000 increase requested is for the eradication of scabies in cattle and horses.

Mr. McLAUGHLIN of Michigan. How much did you have last year for that?

Dr. MOHLER. \$59,500.

Mr. McLAUGHLIN of Michigan. That is what I wanted to get at, the amount you had for that last year.

Dr. MOHLER. The cooperative work looking to the eradication of scabies in cattle and horses is regularly carried on in 13 States. During the past two years there has been a considerable spread of cattle scabies infection in the western States. This was largely due to extensive forced movement of cattle from drought-stricken areas, dur-

ing two successive severe droughts in the Southwest and one in the Northwest. These droughts occurred in regions in which the infection exists to the largest extent—that is, Texas, eastern New Mexico, Montana, and northern Wyoming.

Cattle shipped from these areas were not in condition to be dipped nor would the pressing nature of the emergency permit the delays incident to the application of all preventive sanitary measures. In fact, they could not get enough water to drink, let alone to dip them in, on account of the severe droughts.

Mr. McLAUGHLIN of Michigan. Last year the work seems to have gotten away from you, on account of the emergency.

Dr. MOHLER. Yes, sir; there was a considerable spread.

Mr. McLAUGHLIN of Michigan. In previous years were you making satisfactory progress?

Dr. MOHLER. Yes, sir. As I stated last year, the territory quarantined for cattle scabies was released, but this year we found these numerous outbreaks in different herds of cattle, and we have called upon the States to put these herds under local quarantine until they could be dipped.

Mr. McLAUGHLIN of Michigan. Is that liable to recur, or is it something that you can prevent or eradicate?

Dr. MOHLER. We can control it very readily when we have the proper facilities. Most of this cattle scabies was brought from New Mexico and Texas, and from the Northwest. As I said, we realized that the owners did not have enough water for the cattle to drink, let alone to dip them in the dipping vat.

Notwithstanding that we have had the setback I referred to, there were only 1,431 herds that were found infested, containing about 205,000 cattle.

As you know, in the case of sheep scabies, some of the infested western range sheep came up from New Mexico into your State of Michigan and spread infection in about 54 bands in Michigan.

Mr. McLAUGHLIN of Michigan. Yes, we thought we could increase the food supply by bringing in some sheep and feeding them on some vacant lands; and they brought in some disease.

Dr. MOHLER. Yes, sir; that is right.

The next item is a \$25,000 increase, in connection with the supervision of the interstate transportation of live stock. The present allotment this year is \$150,000, and if the \$25,000 become available, it will bring the total up to \$175,000. Recent years have witnessed great increases in the amount of work required in supervising the interstate transportation of live stock. Regular public stockyards inspection and supervision are conducted at 42 live-stock markets, and in addition, work is performed as occasion may require, in 35 or more other cities. These points are scattered throughout the entire country. The duties in connection with public stockyards inspection have been broadened and greatly increased. Receipts of live stock at the central markets have been mounting, and the spread of sheep and cattle scabies infection, as already indicated, has made it necessary to exercise the greatest vigilance.

The records show that during the fiscal year 1918, 17,019,386 sheep were inspected at public stockyards, while during the fiscal year

1919, 20,516,548 were inspected, and during the first four months of the current year 11,250,764 head of sheep were so inspected.

Smaller but consistent increases are shown by the records covering inspections of cattle.

Due to the spread of scabies infection to the sheep-feeding States, the authorities of several of them have promulgated regulations requiring the dipping, under Federal supervision, of all feeder sheep moving from public stockyards into their respective States. This has increased bureau work at the public markets tremendously, as is shown by the fact that during the fiscal year 1919, 884,294 sheep were dipped under supervision, while during the first one-third of the current year, 2,277,137 head were so dipped.

The assistance of bureau employees at public markets is also requested by the State authorities in the handling of numerous other details of the traffic in live stock from such markets into the various States.

Another item in which there has been a very marked increase in the volume of work performed is that of supervising the immunization of swine at public stockyards for movement therefrom for purposes other than slaughter. The number of hogs immunized under Federal supervision has more than doubled each year during the past three years. For instance, in 1917 we supervised the immunization of only 94,720 hogs, while in 1918 there were 254,731, and in 1919, 614,673 hogs immunized at public stockyards, all of which meant considerably more work.

This work is a very important item in the greater production of pork, as the animals immunized ordinarily average about from 100 to 110 pounds in weight, and after fattening in the country are returned to the markets at about 250 pounds average weight. If this Federal supervision were not maintained the animals now being immunized for shipment to the country would either have to be sold for slaughter without fattening or, if their distribution were permitted, would spread swine diseases all over the country with resulting tremendous financial losses caused by such diseases.

Swine immunization is work that requires the very closest supervision, because of its technical character and because large quantities of potentially dangerous products are handled. It therefore adds greatly to the cost of supervision over the interstate transportation of live stock. Following its policy of cooperating with State authorities to the fullest possible extent, the bureau also supervises the immunizing of swine for intrastate movement when it is requested by the State authorities.

In addition to the above factors there have been salary increases to employees in order to enable them to meet to some extent the advanced cost of living. This has been done especially with lay inspectors, whose salaries in former years were very low, and a considerable number of whom are assigned to duties at public stockyards.

The next item is paragraph C, which requires the appropriation of \$3,020 more for the supervision of the importation of animal by-products, including hides, wool, forage, etc.

The CHAIRMAN. This is for the inspection of the importation of hides?

Dr. MOHLER. The importation of hides; yes, sir. The work under this project is conducted in accordance with joint regulations of the United States Treasury Department and Department of Agriculture, which confer upon this bureau the authority and responsibility of supervising the sanitary handling and disinfection of hides, skins, wool, etc., after arrival in this country whenever such materials come forward from a foreign country without certificates showing freedom from the infection of certain diseases.

The United States has become one of the great markets for foreign hides, skins, wool, and other animal by-products, and with foot-and-mouth disease and rinderpest and anthrax prevalent in many of the countries supplying materials, it seems even more essential than ever that a careful supervision be maintained over their importation.

The present allotment of funds for this work is proving inadequate and will not enable the bureau to continue efficient control over shipments of this character. A large percentage of these imports are entered at the port of New York and from our records it is possible to show the increased volume of unrestricted hides, skins, and wool constituting such shipments handled by the bureau during July, August, and September, 1919, as compared with the same period of 1918. It may be a matter of interest to know that for those three months in 1918 there were 33,394 hides imported, while in July, August, and September of 1919 there were 1,436,000 hides imported, an increase of over a million hides.

There were 2,170,000 skins imported in those three months in 1918, while for the first three months of the fiscal year 1919 there were 8,400,000 skins, an increase during those three months of over 6,000,000 skins imported into the country. The same is true with bales of wool.

The CHAIRMAN. How do you account for the large increase in the importation of hides and skins?

Dr. MOHLER. The great demand for the raw materials to be made up into manufactured goods by our textile workers in the United States.

The CHAIRMAN. Is that permanent, or just to meet the war emergency?

Dr. MOHLER. I am afraid it will not be permanent, because Germany before the war imported more skins and hides than we did, and I am afraid that we will lose a great deal of that business as soon as the textile workers of Germany get back to their industry.

The CHAIRMAN. The hides and skins are imported and manufactured into finished articles?

Dr. MOHLER. Yes, sir. The same thing is true as to bales of wool. There were 1,632 bales of wool imported in 1918 for those three months, and for the first three months of this fiscal year there were 3,275 bales imported, an increase of 1,643 bales of wool.

Mr. RUBEY. That increase in the importation of hides, I suppose, accounts for the price of shoes going up?

Dr. MOHLER. I do not know. It seems paradoxical, and it is indeed pretty difficult to explain why the price of shoes have gone up so tremendously.

The last item in that appropriation is \$2,000 for the inspecting and testing of animals for export. The expense in connection with the exportation of live stock has been greatly increased, due in part to the shipment of cattle to France and Belgium for restocking the devastated areas of those countries. There were included in these shipments in the four months, July to October, 1919, 10,492 dairy and breeding cattle gathered from many different States and forwarded to Newport News for embarkation. All of these required bureau inspection and tuberculin testing.

Mr. McLAUGHLIN of Michigan. I thought you were going to do that under the previous item.

Dr. MOHLER. Which item?

Mr. McLAUGHLIN of Michigan. What the gentleman spoke about when the tuberculosis item was under discussion. One of the gentlemen said that he went down to South America and worked up a big foreign trade for cattle and was talking about inspection for tuberculosis in animals that were to be shipped abroad.

Dr. MOHLER. That item you refer to is the \$1,500,000 for the eradication of tuberculosis. This export work does not help to eradicate tuberculosis in this country by the accredited herd plan. It merely helps to build up an export trade. We have specific authority for fostering an export business in live stock and their products.

The CHAIRMAN. How much was appropriated for this last year?

Dr. MOHLER. \$7,000.

Mr. LEE. What type of cattle are we exporting to France?

Dr. MOHLER. Seventy-five per cent were Holstein grades. The remaining 25 per cent were high-grade cattle, mostly of the dual purpose type. The cows were not pure bred but all the bulls were pure-bred Holsteins. Taken as a whole they were a high-grade type of dairy stock.

The CHAIRMAN. The export business is increasing?

Dr. MOHLER. Very much so.

The CHAIRMAN. I take it that the export trade is more or less temporary.

Dr. MOHLER. Yes; but I saw while I was in Chicago last week an order for over 800 dairy cows to go to Mexico. Cuba also is buying a great many dairy cattle, and, as Mr. Harding said this morning, the increased demand from South American countries has been enormous, not only for cattle but also for hogs. The present allotment of funds for this work is proving inadequate and will not enable the bureau to continue efficient control over shipments of this character.

The exportations of sheep to Canada has likewise been unusually heavy. Thus, as compared with the entire year ending June 30, 1919, during which 5,163 sheep were exported, 10,938 sheep were exported in the first four months of the present fiscal year.

Mr. McLAUGHLIN of Michigan. Does Canada accept any inspection by State authority?

Dr. MOHLER. No, sir; she does not.

Mr. McLAUGHLIN of Michigan. Why?

Dr. MOHLER. It is pretty difficult to give the reason for the other person, but I imagine they have found that these health certificates, especially the tuberculin test charts that they have accepted in the past, have not been satisfactory; so they require a certificate from a Federal inspector.

Mr. McLAUGHLIN of Michigan. If the Government did not do it, what would ultimately be the result? The States that are not carrying on a proper inspection would come to find it necessary, would they not? They would be compelled to encourage a proper system of inspection, to carry it on, or their people would lose the trade?

Dr. MOHLER. I think what would happen, Mr. McLaughlin, is that if the bureau did not make the inspections of cattle, hogs, and sheep the Canadians would not get anything of that character from the United States. I talked with the veterinary director general last week in Chicago, at the International Live Stock Show, about accepting the States' tuberculin certificates from the State men, and he told me very frankly that he was not in a position to accept those certificates at this time. He is, however, in position to accept cattle from our accredited herds without any further restriction, and to allow them to come into Canada on an accredited herd certificate; but further than that he would not go at this time. That is the position you will find the Canadian authorities have taken with reference to the various certificates from State officials for cattle, sheep, and hogs.

Mr. McLAUGHLIN of Michigan. I have no doubt that is their position now; but if the States learned that their people could not do business with Canada, pretty soon they would come to the conclusion that it would be better for them to establish inspection services and do it right.

Dr. MOHLER. Yes; I agree with you.

The CHAIRMAN. According to your table, you employed 265 in 1919, paying them \$464,000. For 1921 you estimate for 251, with an expenditure of \$557,660.

Dr. MOHLER. On what page is that, Mr. Chairman?

The CHAIRMAN. The table is on page 43.

Dr. MOHLER. What is your question?

The CHAIRMAN. You are asking for fewer men and more money?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. That is explained, I take it, by the fact that a number of them were employed part time or temporary?

Dr. MOHLER. Yes, sir; and you also understand that the amount under the column for 1919 is the actual expenditure that has been paid, while the amount for 1921 is purely a pro forma estimate. That is the best approximation that we can give you so far in advance, but you will notice that 38 men who in 1919 were veterinary inspectors at \$1,800 were promoted, so that in 1921 they will get \$1,920. There is the same number of men, but they have been increased \$4,560 in salaries. The same thing obtains right through the list, which explains why a smaller number of men may receive a larger total in salaries.

The CHAIRMAN. Are your salaries in general satisfactory?

Dr. MOHLER. I would not say they were satisfactory, but they are much better than they were this time last year. The morale of the force has improved 50 per cent; so much so that a number of men who resigned before the 1st of July have returned to the bureau service since the salaries have been increased. However, the entire bureau force is expecting more adequate adjustment of their salaries as a result of the labors of the Congressional Reclassification Commission, and therefore I shall not discuss this subject now.

The CHAIRMAN. What would you say about including on the statutory roll a number of these new places?

Dr. MOHLER. I am very strongly opposed to—

The CHAIRMAN. There is much opposition to the lump sum appropriations in the House. It is contended that they should be placed on the statutory roll so that the House may know exactly the number to be employed.

Of course, you give an estimate of the number here, but that is not definite nor entirely satisfactory to the House.

Dr. MOHLER. Personally, I am very strongly opposed to putting these scientists, laboratory workers, and inspectors on the statutory roll. The present plan of having them on lump-sum rolls makes the service a very flexible organization. As an illustration, if, like at present, we are spending pro rata more money than is available for tuberculosis eradication, instead of laying off or dismissing 100 men, we can bring them over to our meat inspection service. The winter season is starting, and the amount of meat inspection is greatly increasing. There is more live stock being brought for slaughter at this season of the year than at any other time. We can bring those men in and put them into meat inspection work, and in the spring we can send them out when hog cholera is starting to appear in the country. When you have them on the statutory rolls, you can not make that transfer without causing a great deal of hardship.

The CHAIRMAN. In what way?

Dr. MOHLER. If we had a man who was drawing a certain salary on a statutory roll in tuberculosis eradication, and we found that our money was short, we might have to transfer him to a vacancy in the meat inspection work which might be of so subordinate a character that it would be worth \$300 or \$400 less than he received. Or he may be working alongside of a person who would be getting considerably more money than he. There is no way of controlling these things on the statutory roll, as is evidenced by the repeated experiences with the clerical statutory roll, where two clerks doing the same kind of work may get a difference of \$300 in salaries.

The CHAIRMAN. You transfer them back and forth?

Dr. MOHLER. We make the force as flexible as we can. We do not want an expert on tuberculosis who knows nothing about ticks, or an expert on meat inspection who knows nothing about hog cholera. We try to keep all our inspectors fully informed about every line of work in which we are engaged.

The CHAIRMAN. You transfer them at the same salary?

Dr. MOHLER. Yes, sir; we do.

The CHAIRMAN. Why would it not be just as well to put them on the statutory roll at once?

Dr. MOHLER. If we had the statutory roll under tuberculosis eradication, and had 80 men, 30 of whom were getting \$2,200 and 50 \$1,800, when we came to transfer them to other lines of work they would naturally be placed in work vacancies where they are needed irrespective of the amounts they may be drawing on the proposed statutory roll. At the present time we can adjust things without fear or favor. If there is a vacancy we can promote the most desirable man. This statutory roll proposition, so far as I can see, is a very serious thing to a wide-awake, outstanding young man. He has

to wait for the man in front of him either to resign or die. There is no vacancy that he can fit into because they are all occupied. Furthermore, new places on the statutory roll must be estimated for by the bureau practically a year in advance, and such places must be approved by the Secretary, your committee, and Congress, and may always be stricken out by a simple point of order from the floor.

Mr. McLAUGHLIN of Michigan. Under item 60 there are a number of different kinds of work, for which a lump sum of \$557,000 is provided.

Dr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. We are often asked on the floor how much money is being used for a particular piece of work, and how much for another piece of work, and how much for another piece of work, and sometimes we are unable to answer. I think, as we go along, where an item contains a number of different kinds of work, you ought to help us by stating how much money you spend for each particular kind of work.

Dr. MOHLER. I have that right here and would be very glad to tell you.

The CHAIRMAN. The note indicates the number to a certain extent but when grouped it is difficult to ascertain the exact number of each.

Dr. MOHLER. The present appropriations covered in this item are as follows, for sheep scabies, \$151,378.

The CHAIRMAN. That is for the current year?

Dr. MOHLER. Yes, sir; that is for the current year. We have not asked for an increase in that item. For cattle and horse scabies, \$59,500, and we are asking for an increase of \$10,000. That makes \$69,500. Interstate transportation, \$150,000, and we are asking for an increase of \$25,000. For the 28-hour law, we have \$27,840, and we are asking for no increase there. For the mallein testing of animals for interstate shipment we have \$5,000; for the importation of animals, \$64,980; for quarantine inspection, \$12,000; for the importation of by-products, \$16,980, and we are asking for an increase of \$3,020. For testing animals for export we have \$7,000, and we are asking for an increase of \$2,000 there. For the inspection of vessels we have \$2,500. For the laboratory work, including the dipping outfits for scabies and the work of manufacturing mallein and the preparation of dips and disinfectants for the disinfecting of hides, we have \$15,000.

Mr. McLAUGHLIN of Michigan. You spoke of some by-products. What are they?

Dr. MOHLER. Animal by-products. That would be knolls of wool, bones, hoofs, horns, hair, and different products of that character.

The CHAIRMAN. That is \$15,000?

Dr. MOHLER. No, sir; \$16,980. That is the item for importing by-products where we are asking for \$3,020 in addition.

The CHAIRMAN. Is that for the current year or 1921?

Dr. MOHLER. \$16,980 is for the current year, and we are asking for \$3,020 in addition for next year.

The CHAIRMAN. \$16,980 for the current?

Dr. MOHLER. Yes, sir; \$16,980.

Mr. McLAUGHLIN of Michigan. You have to inspect those by-products to see that they do not carry any disease?

Dr. MOHLER. Yes, sir; and if they are not accompanied by a certificate, they are all disinfected so that we shall take no chances of bringing in foot-and-mouth disease, rinderpest, etc.

Mr. McLAUGHLIN of Michigan. Have you particular places where they are permitted to be brought into the country?

Dr. MOHLER. Yes, sir; principally New York, and also Philadelphia, Boston, and Baltimore. They are all coming in under inspection. Also camel's hair, hog bristles, and things of that kind would all be included in the by-products.

Mr. McLAUGHLIN of Michigan. How about coming across the line from Canada by rail, or from Mexico?

Dr. MOHLER. We have the customhouse officials of the Treasury Department working in cooperation with us, and they notify us whenever anything is coming through. They very frequently are allowed to enter the country, in bond, but they have to be disinfected at destination, if necessary.

Mr. McLAUGHLIN of Michigan. When the Treasury officials notify you, do you have a man to go in answer to that call and make an inspection?

Dr. MOHLER. Yes, sir; we have men scattered along the Canadian border at different points, especially at railroad centers.

The CHAIRMAN. Why not put all of the veterinary inspectors in one group at a certain salary and then apportion them as you think best?

Dr. MOHLER. It would not work out well, if you are going to confine this number of veterinarians each at so many dollars per annum on the statutory-roll basis, for the reasons that I have already mentioned. It is submitted that in a work so extensive and complicated as the meat-inspection service and the great eradivative measures handled by this bureau, including foot-and-mouth disease, if necessary, it is absolutely impossible to predict a year ahead how many employees will be required, with their salaries.

The transfer of technical and scientific employees to the statutory roll, such as is now provided for the clerical force of the department, would, in my opinion, be a calamity. It would not be a calamity to scientific workers alone, but to the Government and people of the country as well. It is a well known fact that the adoption of the statutory roll for clerical employees, making it necessary for the clerks to depend upon the resignation or death in the service of employees to secure promotion, has in no way tended to increase the efficiency of the clerical force. It has made promotion so slow and opportunity for advancement so remote that many of the best employees have resigned and others who are of high natural ability have lost interest and refuse further to exert their best efforts. Such action would undoubtedly cause the best men in the scientific and technical branches to leave the Government service as soon as the opportunity offered.

Promotion at present is extremely slow. The salaries of Government workers are now below the scale paid by State institutions and far below that paid by commercial institutions. Not only would capable employees gradually leave the service, but the service would not attract men from the outside. It is difficult enough at the present time to obtain satisfactory scientific employees, without increasing this difficulty.

I believe that, if possible, the salary system for scientific employees should be made more elastic than it is at present in order that those who prove their efficiency by the results accomplished may be rewarded promptly. This would, in my opinion, give a tremendous stimulus to the research activities of the Department of Agriculture.

The appropriations for the salaries of scientific and technical employees, which at the present time can be used as the work requires, could not be economically administered under a statutory system, and there would be a tendency to maintain continuously a larger staff than necessary in order to be able to meet emergencies. It is also my belief that fewer applications will be received for appointment in the bureau service if this class of employees is placed upon the statutory roll. I might add that the turnover in our bureau in the last 12 months has been almost 40 per cent. We have lost 1,956 employees in the last fiscal year.

Mr. RUBEY. How many men, approximately, did you dismiss during the year?

Dr. MOHLER. Eight.

Mr. RUBEY. For inefficiency?

Dr. MOHLER. For various reasons.

Mr. HARRISON. That does not, of course, include reductions in force.

Mr. RUBEY. I am just asking for the number dismissed. Do you have difficulty in dismissing a man from your service who is just simply lagging along, doing what he is required to do, but doing it about as inefficiently as he can and at the same time keep his place? Do you have any trouble getting rid of that sort of fellow?

Dr. MOHLER. It is a very difficult thing to get rid of a man who is just about on the border line.

Mr. RUBEY. Under the civil-service regulations you can not dismiss a man without charges being preferred against him, can you?

Dr. MOHLER. No, sir; we can not.

Mr. HARRISON. The procedure is prescribed by law. We are compelled to prefer charges against a civil-service employee before he can be dismissed and frequently it is exceedingly difficult to cite specific instances wherein he has been inefficient. The natural result is that many people stay in the Government service who would not be retained by a business organization.

Mr. RUBEY. I just wanted to call that matter up.

Mr. HARRISON. I think it is safe to say that it frequently takes from a month to two months to dismiss an employee from the service.

Mr. McLAUGHLIN of Michigan. Before whom do you have to appear and make your charge against a man?

Mr. HARRISON. We do not have to appear before anybody.

Mr. McLAUGHLIN of Michigan. You spoke about the necessity of making a showing. To whom do you make it?

Mr. CANDLER. Do you have to take it up with the Civil Service Commission?

Mr. HARRISON. We do not have to take it up with the Civil Service Commission. We send the record to them after we have acted.

Mr. McLAUGHLIN of Michigan. Does the Civil Service Commission pass on your complaints against your own employees?

Mr. HARRISON. No; they do not pass on our complaints; we merely file with them the papers showing our action. Here is the difficulty.

We are compelled to cite specific instances of inefficiency, assuming that is the charge, and that is exceedingly difficult in many cases. We may know that the employee is generally lazy, or a number of relatively minor things may have occurred which indicate that he is generally inefficient. You can appreciate how cases of this sort will arise in a large organization, yet when it comes to preferring specific charges, indicating specific instances of inefficiency, it is an exceedingly difficult thing. All cases involving disciplinary action other than a reprimand are considered in the Secretary's office, and, if the charges are not sustained, the employee, of course, is not dismissed.

Mr. RUBEY. If the man himself is not satisfied he can go to the Civil Service Commission and take it up with them and ask them why he has been dismissed, can he not?

Mr. HARRISON. Yes; he may take it up with the Civil Service Commission, and at times the Civil Service Commission has communicated with us about particular cases, but, so far as I know, it has never objected to our action.

Mr. CANDLER. If the Civil Service Commission does not approve your action in discharging a man, can they reinstate him?

Mr. HARRISON. No; they have no power, as I understand it, to revise the action of the department.

The CHAIRMAN. Why not put all of the veterinarians in one group?

Mr. HARRISON. One of the greatest difficulties is that we are compelled to make these estimates so far in advance. We can not even guess with any degree of accuracy what the conditions are likely to be next year. It seems to me that some latitude must be left to the department in the handling of its personnel.

The CHAIRMAN. You have a veterinarian listed on several pages. Why not put them all under one group?

Dr. MOHLER. That is according to the procedure adopted by the department years ago and is, I believe, in accordance with law or at least with the requirements of the Littlefield committee.

The CHAIRMAN. We write our own bill. When we appropriate a lump sum we do not know how the salaries are apportioned. You make estimates and, of course, we know that you expect to carry them out in good faith and that these are the salaries that you expect to pay. It amounts to the same thing, but a statutory roll is a more comprehensive and intelligent way of doing it.

Dr. MOHLER. I object to putting them on the statutory roll and confining a certain salary to a certain position or to a certain man. I have been told that there were statutory positions established some years ago for scientific workers, and it was abandoned because it did not function satisfactorily.

Mr. HARRISON. Some of the States have tried it but it has been a miserable failure.

Dr. MOHLER. I know that is true.

The CHAIRMAN. This is practically the same. You are indicating to Congress just what you expect to pay in salaries. You start on page 43 with one veterinary inspector at \$3,500, one at \$3,000; and so on. That is what you state that you expect to pay. Why not write it in the law?

Dr. MOHLER. At the present time the Secretary can reduce that salary or raise it, but if you state in the law that the Chief of the

Quarantine Division must get \$3,500, it takes it out of the discretionary power of the Secretary entirely. This chief might leave and the next man might not be worth \$3,500. But you must fill it or have the money lapse into the Treasury.

The CHAIRMAN. We could specify out of a \$100,000 item intended for salaries that \$75,000 should be paid at certain rates on the statutory roll, and carry \$25,000 in a lump sum so as to give you some discretion and leave it flexible. It seems to me that the lump-sum appropriations are unjustifiable, and an unbusinesslike way of doing it. Congress has been criticized for it. I believe that this committee has reported bills carrying a larger statutory roll than practically all the other committees together, but I believe it can still be improved upon. If Congress is to determine what salaries are to be paid or are to have anything to do with it, it should be done in the act.

Dr. MOHLER. Congress has already stated that the Secretary will be permitted to pay \$4,500 as a maximum salary for scientific workers, and he has not abused that privilege. I think it is much better to leave these lump-sum salaries to his discretion rather than to make it compulsory, for instance, that the Chief of the Quarantine Division, or the assistant chief, be given just that amount and nothing more or nothing less. That is where the hardships of the statutory roll, to my mind, come in; it is so absolutely inflexible.

The CHAIRMAN. If these tables in the estimates are not to be adhered to they do not amount to anything. We, of course, expect you to make certain changes. We know that you carry out your estimates in good faith. When we get on the floor we are criticized for lump-sum appropriations. It is stated that there is nothing to indicate what they will be used for. The only way of answering the criticism is to call attention to the estimates and the plans indicated therein.

Mr. HARRISON. The department, of course, can not say absolutely what it will be necessary to do 12 months from now.

The CHAIRMAN. I do not ask to state exactly, but to come somewhere near it.

Mr. HARRISON. This is our best estimate. This is what we intend to do so far as we can determine on the basis of present conditions.

The CHAIRMAN. It should be something more than an intention, it should be written in the law.

Mr. HARRISON. There are many arguments in favor of lump funds, especially in connection with the prosecution of scientific and technical work. The matter was thoroughly discussed and a statement prepared by a committee working for the Joint Commission on Reclassification and printed in the Star of November 9. The committee has indicated some very specific, and I think sound, objections to statutory rolls, and I would like to read the statement to the committee.

It is a long statement, but the matter we are discussing is one of the most fundamental problems in the Government service to-day—the question whether the hands of administrative officials are to be further tied by statutory rolls or whether they are to be given some discretion in the administration of the work authorized by Congress.

The CHAIRMAN. I do not want to tie their hands, nor do I want to leave it entirely to them as at present under the lump-sum appropriations.

Mr. McLAUGHLIN of Michigan. If we could get rid of the responsibility and give it to you, I would be very glad to do it.

Mr. HARRISON. If Congress authorizes the expenditure of a certain amount of money for a certain kind of work, it is then up to the executive officers, the men who are doing the work, the men who are actually responsible for the results secured, to carry out the purpose of Congress.

The CHAIRMAN. But it is the duty of Congress to know how they are going to spend it.

Mr. HARRISON. Next year we will, of course, report the results to you, and, if Congress does not think that the expenditures we have made are justified, then it should cut the appropriation. I think anyone in the Government service holding a responsible position will say that the one thing that would seriously disrupt the Government service would be to put the scientific and technical workers on the statutory roll.

The absolute hopelessness that prevails among employees on the statutory rolls, knowing as they do that they may stay there for years without material advancement, that their ability, ambition, and energy will not be adequately recognized, is very demoralizing. We have come here year after year with recommendations for promotions on the statutory rolls, but they rarely ever go through. You gentlemen know that we proposed a readjustment in the lower grades on the statutory rolls last year, but no action was taken. There have been very few changes on these rolls in the last five or six years.

The CHAIRMAN. Your statement would be an argument in favor of the statutory roll. I am perfectly willing to accept the statement and the judgment of the department. I do not believe anybody wants to cripple the department. We do not want to cut salaries. We want to give all they are entitled to; but I do like to do business in a businesslike way, and the ordinary business man would not continue over the new year if he did not have some system of doing business in a regular businesslike way. The only way to do business is to know exactly what your money is to be expended for, and it is the duty and the function of Congress to absolutely determine this. Then it is left to the department to expend the money according to the direction of Congress.

Mr. HARRISON. Is there a business organization in the country, operating on a large scale, that tells its general manager just what he may pay in salaries a year from now? It is not my understanding that the board of directors of a business organization limits its general manager in the handling and pay of its personnel in the manner that the executive departments are limited. It might be said that Congress is the board of directors of the Government service and that the head of each department is a general manager. The budget of a business concern is usually fixed a month or two, perhaps less, in advance of its fiscal year, and even then much discretion is given to the general manager in connection with the pay of the personnel. Furthermore, a meeting of the board of directors can be called at almost any time to deal with any unusual situation that may develop, so that, in any event, a fixed salary roll in business would not present the same difficulties that exist in the Government service.

The CHAIRMAN. The general manager submits his plans to the directors, and the directors determine it.

Mr. HARRISON. Certainly.

The CHAIRMAN. It should be so with the Government, too, as with any well organized business institution.

Mr. LEE. I do not believe there is any man in the world who runs his business a year in advance.

The CHAIRMAN. Let us leave some latitude, of course. If we are to accept the statements of the department without writing it in the law, we will have to say to Congress, "Here is what the department expects to do," as we have done from time to time, and for which we have so often been criticized.

Dr. MOHLER. It is just a matter of integrity. That is the point I want to emphasize. There certainly has been no abuse in any bureau of the Department of Agriculture of this lump-sum roll, and I am sure you will find it would be the worst thing that could happen in our department, particularly to our best men, if they felt that they were going to be shackled by the statutory chain of a certain salary for a certain job. Instead of losing 1,900 employees we would lose practically all of our best men, and we are losing them fast enough under present conditions.

We know the psychology of these men, and we know the psychology of our clerks under the statutory roll. We run our offices with a lower average grade of clerks as compared with what we would have if a lump sum were available to pay them from. The same thing would obtain if we had to put our scientists on the statutory roll.

Mr. McLAUGHLIN of Michigan. There is an appropriation of \$557,000 and you might expend all that for salaries if you wanted to.

Dr. MOHLER. No; that is unthinkable. That is what you gentlemen seem to understand generally. We could not put all of that in salaries. We have a certain amount of work to accomplish, and if we paid these men \$557,000 in salaries, when we came here next year we could not show you any results. I keep coming here every year and keep showing you that we are protecting the live-stock interests of the country and giving you results. We could not possibly do that if we were only paying salaries.

Mr. McLAUGHLIN of Michigan. The statement that was made a few minutes ago was that it was the duty of Congress to make appropriations and put them in the hands of the executive departments to do with them just as they please.

Mr. HARRISON. I do not think I made that statement.

Mr. McLAUGHLIN of Michigan. I do not believe that is the limit of the responsibility of Congress. I do not like to assume responsibility I do not have, but I feel some measure of responsibility as to how this money is spent.

Mr. HARRISON. I did not mean to suggest that Congress should not put any limitation on appropriations that may seem to it to be wise, but I was merely trying to point out, Mr. McLaughlin, that some of the limitations handicap the executive officers, and to express the view that it is necessary for Congress to trust such officers to do their duty. These men feel their responsibilities and will, of course, endeavor to carry out the wishes of Congress as best they can. This

tuberculosis matter is a case in point. The department urged Congress not to place any limitation on the expenditure of the appropriation, realizing then the situation which was explained to you this morning would develop.

I was answering Mr. McLaughlin's statement, and was referring to a specific case where Congress exercised its judgment, as it had a perfect right to do, and refused to trust its executive officers. As a result important work that ought to go forward has been held up and it has been necessary to discharge a number of men. A considerable sum of money, appropriated by the Congress for the eradication of tuberculosis, can not be used for that purpose because of a limitation of the appropriation and it is going back into the Treasury. Will it not be time to raise that question when there has been an abuse of the authority and of the leeway you have given us?

The CHAIRMAN. My contention is that we should do business in a business way. As a private individual, I would not expect to do business in this way. It is a question as to whether I do my duty as a Member of Congress, or turn everything over to the Executive. Of course, I have confidence in the Executive, but that is not enough.

Mr. LESHNER. To what extent would you suggest that these salaries be put on the statutory roll?

The CHAIRMAN. I would not put them all on the statutory roll, but a large number of them.

Mr. LESHNER. Put them all on the statutory roll?

The CHAIRMAN. No. Not all of them. Here is an item of \$527,000, with not one salary on the statutory roll. I can not conceive of any business man saying that that is a businesslike way of doing business.

Mr. HARRISON. It is not my understanding that any business organization has an inflexible roll which can be changed only once a year.

Mr. RUBEY. Mr. Chairman, I want to study this question and I want to get all the information I can on it. Mr. Harrison a moment ago called attention to a statement prepared by the commission on the reclassification of salaries, and I believe it would be a good idea to print it in the record so we can look it over carefully.

The CHAIRMAN. I have no objection to that.

Mr. McLAUGHLIN of Michigan. By whom was it prepared?

Mr. HARRISON. It was prepared by one of the advisory committees, Mr. McLaughlin, appointed by the Joint Congressional Commission on Reclassification, a committee consisting of Mr. Manning, Chief of the Bureau of Mines, Mr. Myers, chief clerk of the Treasury Department, Mr. Ryan, of the Bureau of Education, and Dr. E. B. Rosa, of the Bureau of Standards. They set out under various headings the disadvantages of the statutory roll. The first heading, for instance, is the "Difficulty of foretelling statutory positions needed," under which the committee indicates very clearly the impossibility of any satisfactory estimate, so far in advance, of the positions required. We can not say now what salaries it will be necessary to pay next July. Congress authorizes a new line of work and we go ahead and organize it, securing the best available men at salaries they are willing to take. We can not tell in advance what we will have to pay them. Other headings in the statement are "Inequalities and

injustices under statutory salaries" and "Unused statutory vacancies." Year after year we have many low-salaried statutory places which we are unable to fill and the money goes back into the Treasury. The committee cites many other disadvantages of statutory rolls, but I will not attempt to enumerate them.

Mr. RUBEN. May that go into the record?

The CHAIRMAN. Yes; I have no objection.

(The matter referred to follows:)

LUMP-SUM WAGE APPROPRIATIONS ARE FAVORED.—107,000 UNITED STATES EMPLOYEES AFFECTED BY SUBCOMMITTEE'S PROPOSAL.—STATUTORY SCHEDULE MEETS OPPOSITION.—THOROUGH RECLASSIFICATION OF SERVICE PROVIDES FOR ADEQUATE PROMOTIONS.

Lump-sum appropriations for salaries as opposed to statutory fixing of individual wages for the 107,000 Federal workers in the National Capital was recommended to the Joint Congressional Commission on Reclassification of Salaries in the District to-day by a special subcommittee composed of Van. H. Manning, Chief of the Bureau of Mines, chairman; Paul Myers, chief clerk of the Treasury; W. Carson Ryan, jr., Bureau of Education, and Dr. E. B. Rosa, of the Bureau of Standards.

"The object of Congress in establishing statutory positions is to retain control of the salary schedules of the Government service," declared the summary of the elaborate report. "The object of the administrators in advocating lump-sum appropriations is to secure sufficient freedom to do the Government work efficiently.

OBJECTS NOT TO CONFLICT.

"The two objects are not necessarily in conflict," continued the summary. "A thorough reclassification of the service, with adequate provision for promotion and a strict supervision by a central agency, will accomplish both objects.

"(b) The commission, by the very fact of making a complete classification of all positions, will answer the demand of Congress by assigning definite salary scales for all positions, which will be approved by Congress. The question of lump sum or statutory will, therefore, if the commission's reclassification report is adopted and a budget system introduced, be settled by incorporating the best features of each into the new system.

"(c) The central agency that will be set up to carry on the classification—supposedly the Civil Service Commission—should have representatives in every department to cooperate with the department heads in personnel matters and to check up the whole system for the Government. Full reports should be made to Congress annually, showing the working of the system and suggesting any necessary amendments of it."

The reclassification commission has taken no action as yet upon the recommendations. The full report, with the exception of the summary already given, follows:

" 1. STATUTORY SALARIES.

"Statutory positions are fixed by Congress for each bureau or administrative unit in the service in the annual appropriation bills, the number of positions of each kind and the salaries of each being specified in detail. These positions are of two kinds, (a) where the salaries and titles have been standardized, and (b) where the salaries and titles are recommended by the bureau chief or head of the particular branch of the service concerned. No change can be made in the title or salary of any position after it is granted except by Congress, and this is done only in the annual appropriation bills. Moreover, any increase of salary is subject to a point of order in Congress, and hence even if the appropriations committee has recommended an increase in any given case it can only be granted by unanimous consent.

"This fact alone, namely, that Congress has provided no regular method of revision of salaries or making promotions in statutory positions, and can not do it if a single Member objects, is one reason for discontinuing such a system. As estimates are made out by the departments at least 9 months before the beginning of each fiscal year, it is 21 months from the time the estimate is

made until the end of the fiscal year during which the money is expended. Of course, it is impossible to foresee the requirements of a bureau's personnel or of the personnel of any particular line of work in a bureau accurately in detail a year or more in advance. No matter how carefully the work may be planned, conditions change and it is usually necessary to modify plans and make changes in personnel, sometimes very considerably, to meet changed conditions.

" 2. DIFFICULTY OF FORETELLING STATUTORY POSITIONS NEEDED.

" But even if external conditions did not change, it is impossible to foretell how work will develop and just how many men of different kinds and grades will be needed for a given investigation. Suppose, for example, an investigation is undertaken which requires physicists, chemists, mechanical engineers, statisticians, and clerks. To estimate a year in advance how many men of each kind will be needed and the salaries of each would be little better than guesswork. When the work is undertaken the men in charge of the several branches of the work develop the problem gradually, and they gather their personnel as needed and as they can. It is partly a question of what is needed to do the work as it develops and partly a question of what men can be found who are competent and available at the salaries that can be paid.

" If man who is splendidly equipped for some part of the work is found who can be had at \$4,000 a year, it is very awkward if the highest statutory salary available is \$3,000, and only statutory salaries are available. Perhaps two chemists are needed and only one has been estimated for; or perhaps two mechanical engineers were provided and it is found that one would better be an electrical engineer. In short, to be hampered and embarrassed by restrictions of this kind which do no good and make it impossible to carry out work efficiently is exceedingly undesirable.

" Under a lump-fund appropriation the bureau chief is free to employ the men most needed and to make salaries fit the men, instead of trying to fit the men to predetermined salaries. Under this plan the service of anyone may be discontinued when not required and the money used for some other position. The plans for the work may be developed gradually and the division of funds between salaries and other expenses may be determined by the needs of the work and not by a guess made a year in advance.

" 3. PROMOTIONS.

" Under a statutory-salary plan promotions are made by advancing men to vacancies at higher grades. These vacancies usually arise either by the securing of new positions at higher salaries, or by resignations. In a bureau that is growing rapidly there are apt to be many new positions, and if these are secured in the upper grades, promotions can be provided for. It is impossible, however, to foresee a year or more in advance where promotions are most needed, and it is also impossible to foresee what vacancies are going to occur by resignations. Hence it often happens that it is difficult or impossible to make the promotions that are most deserved, and one is obliged instead to make such as can be made. That is, promotions can not be made strictly on merit, but must be determined to a large extent by accident. It may happen that two men of the same salary are equally deserving of promotion, but there is only one vacancy. Perhaps the next higher vacancy is \$400 above the given salary. The just action would be to give each \$200. But that is impossible with statutory salaries, as the salaries can not be changed. One must be given \$400 and the other nothing, or else neither promoted and the position left vacant or filled by an appointee from outside the bureau.

" Such distressing situations often arise where statutory salaries prevail, but do not on a lump-sum basis. Where a bureau is growing slowly or not at all there are vacancies for promotions only as resignations occur at the top, or salaries are increased by Congress. Vacancies at the top due to death are usually too slow to provide promotion. Hence resignations must be depended upon, and these are apt to be from the men that are most useful. To lose the best in order to promote the rest is very detrimental to the service. A lump-fund plan that will permit promotion of those who deserve it most without sacrificing valuable members of the staff is extremely important.

" 4. INEQUALITIES AND INJUSTICES UNDER STATUTORY SALARIES.

"If a position has a special title and there is only one of a kind in the bureau, promotions can not be made without special action of Congress. For example, chief chemist, chief clerk, chief mechanic, chief engineer, secretary, librarian, and a great many other similar positions may occur only once in a given scientific bureau. The holders of these positions frequently go on year after year without promotion, and although they may be especially deserving. Sometimes they resign for this reason; sometimes they are transferred to other positions where they can be promoted; sometimes their salaries are raised by Congress. The latter action is relatively infrequent, however, and this partly because the bureau chiefs are often instructed not to ask for any increases in salary. Bureau chiefs should be encouraged to equalize salaries when they become unequal—to correct injustices when they occur. However, it is well known that promotions and equalization of salaries are being made for lump-sum employees, and for statutory employees where there are vacancies. Nevertheless, all departments are frequently requested to ask for no increases in statutory salaries, even to correct the most glaring cases of injustice that may arise through the inflexibility of statutory salaries. This is one of the strongest reasons for discontinuing statutory salaries.

" 5. UNUSABLE STATUTORY VACANCIES.

"At the present time there are a great many statutory positions in the Government service vacant because the salaries are so low that they can not be filled. In such cases the money can not be used for any other position or purpose but reverts to the Treasury. This puts administrative officers under pressure to fill positions as best they can, even though unsatisfactorily, rather than get nothing out of them. This is not an efficient use of the money, but may be justified as being better than leaving the position vacant and neglecting work that is calling for more help. It hurts the service to have such cases occur, and they never do occur under a lump-sum plan.

" 6. OTHER DISADVANTAGES OF STATUTORY SALARIES.

"It is inconceivable that a private corporation employing the services of scientific and technical men, and employing labor on a large scale, would operate on a statutory basis, as it promotes inefficiency and destroys the morale of the workers. If merit can not be rewarded when it is deserving, the result is loss of efficient conduct of the work. If not rewarded, the employee becomes discouraged, and if he does not leave the service, his work usually deteriorates in quality and diminishes in quantity. As the number of such discouraged employees increases from month to month, the working morale of the force is weakened and the output soon decreased. The statutory salary does not encourage initiative, enthusiasm, or ability, and it holds the employee with these qualities to the salary level of employees lacking them. In the economical conduct of some special work, it is sometimes not advisable to promote the understudy for a particular piece of work to the salary vacated by the chief of the division or section where there is a wide range in salaries. This promotion should not be made until the successor to the section chief has shown his ability. Yet under a statutory system, it would often be necessary to promote the understudy to the chief's position or leave the position vacant. Emergency work or work in an overburdened section can not be cared for, because of the special character of the work, for which men in any other section are not properly qualified; and even when so qualified, their assignment to the overburdened section will usually mean embarrassment to the work of the section from which they are taken.

" 7. FILLING POSITIONS OF SPECIAL CHARACTER.

"Probably never before has the overwhelming importance of the personal equation been so fully recognized as it is to-day. One man makes a brilliant success where another has failed totally, although having the same advantages at his disposal; another, surrounded by every advantage which could reasonably be expected, permits the decay and dissolution of a great business built

up by a predecessor under the most adverse conditions. The reason for the success on the one hand and the failure on the other is directly due to the man involved. Therefore, people universally recognize the importance of securing and retaining the services of the right man, and no commercial organization would consider depriving itself of the power to pay a larger salary than usual in order to obtain the services of the right man for a particular line of work. Therefore, if the head of a bureau is authorized to make certain investigations which required a man of unusual talent who could not be obtained for the salary fixed by law he would lose the opportunity of obtaining this man; whereas if some elasticity is provided the services of the best man could be secured.

" 8. OBJECTIONS TO LUMP FUNDS.

" Statutory salaries present so many difficulties and disadvantages that in some bureaus lump funds are in vogue much more than statutory funds, and in some almost entirely. One of the principal objections to lump funds has been that the various bureaus are enabled to fix salaries without conforming to a common scale, and considerable inequalities arise. It is true that the character and quality of the work varies in different cases; and the salary scales perhaps vary less than they appear to do. But it must be granted that there are differences for men of the same qualifications and responsibilities, and if proper coordination and standardization of positions and salaries had been carried into effect the objections to lump-sum salaries would have been less felt.

" Another objection to lump funds has been that men could be transferred to them at higher salaries than they are getting on statutory rolls. This was so strongly felt that it led to legislation forbidding this. However, we believe that difficulty arises primarily from the fact that because promotions were impossible on statutory funds it was sought to do justice to men in the only way possible. Thus the legislation resulted in either driving men out of the service or depriving them of promotions to which they were entitled. It may be in some cases that men have been promoted who did not deserve it. But that can happen under either plan.

" Certainly the advantages of a lump-sum plan are very great, and if its principal disadvantages can be eliminated statutory salaries could be largely or entirely dispensed with to the lasting benefit of the Government service.

" 9. A STANDARDIZED PERSONNEL.

" The congressional reclassification commission is engaged in classifying all Government positions in the District of Columbia and proposes to make out a system of standardized titles with the duties and qualifications for each. A range of salaries for these various positions will presumably be suggested. If Congress adopts the report and fixes the salaries, it will be setting very definite restrictions and giving very definite instructions to the bureaus in making appointments and promotions. If funds are provided to the various bureaus for their work in accordance with some kind of a budget, in which the work to be done is described and the money to be spent is estimated, together with an approximate list of positions of various grades that it is expected to fill, then the bureaus will be free to spend the money as efficiently as possible and not be tied up by fixed numbers of fixed salaries as under the present statutory system, nor left as free from restrictions as to salaries as under the present lump-fund system. The disadvantages of each plan will largely be done away with and the best features of each preserved. It will, of course, be necessary under this plan that the permanency and stability of statutory places be secured for the permanent positions in a bureau. It will also be necessary to have some sort of effective supervision of promotions, such as the Civil Service Commission gives to appointments, to see that the scheme of standardized salaries is followed, that exceptions or special cases are justified, and that the interpretations of the terms expressing the duties and qualifications of the various positions are substantially uniform in the different bureaus and departments of the Government."

" 10. PROMOTIONS UNDER THE NEW SYSTEM.

" How promotions shall be made under the new system has not yet been decided. It is very important that they be made according to merit, rapidly for those who develop rapidly, slowly for those who progress slowly. Any

system which makes it impossible to promote men and women according to merit can not be satisfactory or right. Automatic promotions which put all in one class and offer no incentive to industry and effort are of course out of the question. On the other hand, if there is no automatic promotion there should be provision for systematic revision of salaries and frequent promotions for all who deserve them. Some method of recording the quantity and quality of work done and the responsibilities carried would seem to be necessary for all grades of the service. If this can be provided and the range of salaries specified can be made adequate and sufficiently flexible in some way so that they can be maintained comparable with salaries outside the Government service, it ought to be possible to maintain a high grade of personnel and to conduct the Government efficiently on a business basis.

" 11. SUPERVISION OF THE NEW SYSTEM.

"The Civil Service Commission, if enlarged and strengthened, could effectively perform this function of supervising promotions and transfers as they now do and see that the standardized system of titles and salaries is followed. It would be desirable to have a representative of the Civil Service Commission permanently detailed to each one of the large bureaus to cooperate with the chief clerk or appointment division in matters of appointments and promotions. Other representatives of the Civil Service Commission could go about among the smaller bureaus giving assistance where needed and seeing that there is satisfactory compliance with the system established by Congress. This will give Congress more adequate control over salaries and positions than heretofore, without unduly embarrassing the bureaus in carrying on their work."

The CHAIRMAN. The function of Congress here is to determine these salaries, and unless we do that we are not performing our duty. Shall we surrender them to the Executive as we have in the past?

Mr. RUBEY. I at one time was a member of the appropriations committee of the State Senate of our State. Our committee made appropriations for every institution in the State, and we made lump-sum appropriations. We could not do anything else. We appropriated so many thousand dollars for the State University, so much for the different insane asylums, so much for the penitentiary, and so much for the different institutions throughout the State, and the State of Missouri runs its affairs in that way to-day, and gives to the people who have charge of the expenditure of that money in the institution the distribution of that money and the use of it in the way in which they think will be for the best advantage of the institution. Every institution, of course, reports to the legislature the following year how much of this money has been expended and the details, and the name of every man that has received a penny is on that list, and when they submit their estimates to the committee they set forth their estimates for every person they want, and the salary they expect to pay him, but they do not always know that they can get him for that salary, and sometimes, as has recently happened, they have had to pay him twice that much in order to retain him. The president of our university, Dr. Hill, is now on the point of going to California at a higher salary, but they will probably pay him that higher salary to keep him in the University of Missouri. If, however, we said, "You can pay Dr. Hill \$7,000," they could not pay him any more, and they would have to let him go.

Dr. MOHLER. The point I tried to cover was that there has been no abuse of this lump-sum appropriation in our department. In fact, the Secretary has given the \$4,500 maximum salary that he is permitted to give by Congress, to only a very few of our most efficient and outstanding people.

The CHAIRMAN. You are limited, of course, to \$4,500, but you can put everybody up to \$4,500?

Mr. HARRISON. The records will indicate that we have not done so.

The CHAIRMAN. I do not question the integrity of the department. I am talking about business methods, and I am trying to do my duty.

Mr. HARRISON. It is merely a question of what "business methods" means, and people will differ on that. I doubt whether there are many business concerns which do not vary their plan of operation to suit their own particular needs.

The CHAIRMAN. One would not be in business very long if he conducted his business in this manner. It accounts to a certain extent for the inefficiency of the Government. It is the loose way that Government business is transacted. I do not know that we can look for any remedy or reform it. I know that I could make certain changes that would be to the benefit of the Government, but that is not the trend at the present time. The executive naturally wants all the power he can. Why have Congress unless it exercises its rights and prerogatives? If we are going to turn all these matters over to the executives, what is the use of Congress spending any time on them?

Mr. HARRISON. Congress, of course, controls the appropriations and indicates the manner in which, or the purpose for which, the money may be expended.

The CHAIRMAN. We ought to have something to say about what it is going to be used for. You spoke of checking up. Can any one point out where Congress has checked up anything? We have had one report from the Committee on Expenditures in the Department of Agriculture. I think we have had about three reports on these expenditures in these 20 years that I have been in Congress.

Mr. HARRISON. The department, of course, is not responsible for that; we submit a report on expenditures every year.

The CHAIRMAN. That is a different thing. You are a part of the executive branch, and we a part of the legislative. It is the duty of the legislative branch to check up just as much as it is your duty to check up.

Mr. HARRISON. I do not think the department should be made to suffer on that account, and it will suffer if all salaries in the department are placed on the statutory roll.

The CHAIRMAN. I stated at the outset that we wanted to make it as flexible as possible, but not as loose as it is at present. I am criticizing Congress, not the department, for this method.

Mr. HARRISON. We are suggesting in these estimates that you authorize the transfer of the forest supervisors, the forest rangers, and the forest guards. These employees have been on the statutory roll for several years, and the arrangement has proven to be an absolute failure. We are merely asking you to give us in a lump sum the total of the statutory salaries provided in the present bill. The only alternative is to considerably increase the salaries of the men at present employed. We are not asking for any increase in the amount appropriated but, with a lump sum, we will be able to handle the situation with the same amount. I take it that Congress is primarily concerned about the total amount provided for a particular purpose.

The CHAIRMAN. You have \$140,000,000, all told; you suggest that we give you \$33,000,000 in a lump sum to go out and expend it as you see fit.

Mr. HARRISON. I think such an arrangement would enable the executive officers to perform their functions much more effectively and efficiently, but, of course, I am not suggesting that any action of this kind be taken.

The CHAIRMAN. Why do you not suggest that so many million dollars be appropriated, and Congress stop with that?

Mr. HARRISON. We are merely contending for reasonable latitude.

The CHAIRMAN. I am perfectly willing to give you reasonable latitude; I am perfectly willing to do that.

Mr. HARRISON. Congress turned over \$21,000,000 to the Internal Revenue Bureau in one lump sum.

The CHAIRMAN. Yes; and we regret that we did it. It was necessary. That was during war times.

Mr. HARRISON. I understand that it was done this year.

The CHAIRMAN. And the pity of it is that the truth will never be known. It was necessary to do it under war conditions.

Mr. HARRISON. I do not think there is any bill that comes before Congress that is so completely itemized as this bill.

The CHAIRMAN. When it comes to salaries, as I stated at the outset, we carry nearly as many, if not more, on the statutory roll as are carried in all the other appropriation bills, but that is no excuse for not doing so all along the line. I believe this committee is entitled to more credit than nearly any other committee, as far as that goes, but, after all, it can be improved upon and should be improved upon. That has been my contention. I have talked about this until I am pretty nearly tired of talking of it. I have talked about it a number of years. It has taken a foothold, and Congress has given it a some attention. I still believe what I am contending for. I do not want to suggest anything radical, but anything we can do along business lines to improve the methods ought to be done. With the unrest in the country and everything else taken into consideration, I believe it is time to give some consideration to these matters. I do not want to injure the department or anybody.

Mr. HARRISON. I don't know of anything that would more seriously cripple the department than to put the scientific and technical force on the statutory roll. I think that statement will be supported by everybody who has had any responsible experience in the Government service.

Mr. McLAUGHLIN of Michigan. How many of these 252 men on page 43 would be called technical men?

Mr. HARRISON. They are all technical men.

Mr. McLAUGHLIN of Michigan. There are several executive clerks there.

Dr. MOHLER. They are all technical or professional men except those in the last eight lines. The latter include messenger boys, an executive clerk, clerks, and laborers who would not come under the lump-sum appropriation this year, as they were transferred by law to the statutory roll on July 1.

The CHAIRMAN. This is a matter that we will have to take up carefully. I intended to bring it up, and have discussed it with a

number of members who I believe have it in mind. Some day we will have to discuss it further and settle it one way or another. We will go on with our hearings now and take this up as a separate proposition. When we write the bill it will be a question whether we will write the salaries on the statutory roll, or whether we will make these lump-sum appropriations. That is a matter of policy for the committee to determine.

Mr. HARRISON. Will you not give the chief of the various bureaus an opportunity to tell you just what effect such action would have on their activities. They are responsible, in the final analysis, for the work under their direction.

The CHAIRMAN. I will be very glad to do that. We want information, we want to discuss it with you. I do not know what the committee may have in mind, but I have in mind exactly what I have stated to-day and all these years.

Mr. HARRISON. May I inquire whether the committee thinks of acting in advance of the report of the Joint Commission on Reclassification? That commission is investigating the whole subject and will make its report to Congress. It has accumulated a mass of data about the Government service.

The CHAIRMAN. There is no more consideration to be given to that commission than to other commissions. I take it we will lose nothing by taking action.

Mr. RUBEY. When do you expect that report?

Mr. HARRISON. The commission is required by law to submit its report during the first week in January.

Mr. McLAUGHLIN of Michigan. Is that the commission composed of Mr. Keating, Mr. Cooper, and so on?

Mr. HARRISON. Yes, sir. It has secured complete records of 107,000 Government employees here in Washington, their duties, and salaries, etc., and it has classified them into a number of different services. It has also accumulated a great deal of information about salaries paid by outside agencies.

The CHAIRMAN. The committee will now recess.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Wednesday, December 10, 1919.

BUREAU OF ANIMAL INDUSTRY—Continued.

The committee met at 10.30 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. We have a number of gentlemen with us this morning interested in the tuberculosis appropriation, from whom we will hear first. This is found in item 61, page 44, of the estimates, "For investigating the disease of tuberculosis of animals, for its control and eradication, for the tuberculin testing of animals," and so on. Mr. Smith, who is live-stock commissioner of the Chicago Live Stock Exchange, will take charge of the order of the witnesses, suggesting the names of those who desire to be heard.

Mr. SMITH. Gentlemen, we appreciate very much the opportunity of being given this hearing, to come here and express some views we

have on this situation, and I would like, first of all, to have Mr. Brown, who is president of the Chicago Live Stock Exchange and president of the National Exchange, which is an organization taking in all of the live-stock exchanges in the United States, say a few words, first, on the general subject.

The CHAIRMAN. We will be pleased to hear Mr. Brown.

STATEMENT OF MR. EVERETT BROWN, PRESIDENT OF THE CHICAGO LIVE STOCK EXCHANGE AND OF THE NATIONAL EXCHANGE.

Mr. BROWN. Mr. Chairman, as well as having the titles that the honorable professor has indicated, I was appointed four years ago as chairman of the sanitary committee of the Chicago Exchange, which has actually to do with the work on tuberculosis, the promotion of the eradication of tuberculosis, and I was chairman for that time. We feel that we have accomplished a great deal on that work in assisting the different departments of the Government who have had that under supervision. I may say, in starting, that we had a gathering in Chicago on the first night of the International Live Stock Exposition, representing 32 States and representing all the breeding associations in the United States that were interested in this eradication of tuberculosis. Prof. Smith will present to you, I think, the resolutions which were offered at that time and carried unanimously by that aggregation of gentlemen. I am particularly requested to present to you the request of the National Exchange, the Chicago Exchange, and our sanitary committee, in the hope that the unused appropriation passed by the last Congress—which, I understand, is approximately \$800,000—may be distributed so that the operating expenses of the Bureau of Animal Industry—which have been, I understand, restricted because certain amounts of this fund have been particularly appropriated to cover the operating expenses and the other part of the fund the indemnification—that that fund which now remains, of \$800,000, which was intended only to be used for indemnification purposes, should be distributed to permit the proper operation of the Bureau of Animal Industry so that they could proceed, and that the indemnification amount would also apply so that this fund could be used in its broader purposes in the eradication of tuberculosis.

The last Congress appropriated \$1,500,000 for the eradication of tuberculosis during the fiscal year ending June 30, 1920. Of this amount, \$500,000 was appropriated for operating expenses, such as the preparation of tuberculin, payment of salaries, and general administration, whereas \$1,000,000 was set aside for the payment of indemnities to the owners of reacting cattle slaughtered. The fund for operating expenses is now nearly exhausted, but there is still left in the indemnity fund something over \$800,000. Apparently it has not taken as much money for the payment of indemnities as many of us predicted. In order that the work may be continued through the year it is hoped that Congress will pass some kind of resolution giving the Bureau of Animal Industry authority to draw on the indemnity fund for the payment of operating expenses. It is further to be hoped that in making the appropriation

for the next fiscal year the law can be so worded that the bureau will be able to draw on the entire fund for either operating expenses or the payment of indemnities.

In connection with this we are looking forward, gentlemen, to what we hope will be an increase in the appropriation in the next Congress. We believe this work is so important that we hope your committee will recommend to the next Congress an increase in the appropriation and in connection therewith, and I desire to present to you that the Chicago Live Stock Exchange and the other exchanges in the United States favor liberal appropriations for the eradication of tuberculosis for the following reasons:

Statistics from the Division of Meat Inspection of the United States Department of Agriculture show that approximately 10 per cent of all the hogs slaughtered in the United States are affected with tuberculosis. These statistics also show that the disease is very prevalent among cattle, more especially among dairy and breeding cattle in the northern half of the United States.

That the large quantity of beef and pork annually condemned for tuberculosis means not only a great waste of valuable meat, but also a waste of feed that went into these animals. We frequently get reports of cattle that die on farms from tuberculosis. The loss on meat condemned by Government inspectors in packing plants, while borne for the time being by the packers, eventually falls back on the producer. Tuberculosis has been costing shippers of hogs to the Chicago market an average of 15 cents per hundred during the past year.

That tuberculosis is a hindrance to the breeding-cattle industry and discouragement to production.

That while tuberculosis is causing a greater annual loss than any other disease of farm animals, it is not highly contagious and can be eradicated. Control work that has been in progress in some of the States and in the Nation-wide campaign inaugurated two years ago by a congressional appropriation of \$500,000, conditional upon State cooperation, has already shown results. The percentage of cattle retained for tuberculosis affected with the disease at the Chicago market during the fiscal year 1917 was 4.34 per cent, and during the fiscal year 1919, 3.09 per cent. The percentage of cattle condemned for tuberculosis at the Chicago market has been reduced from 0.94 per cent in 1917 to 0.57 per cent in 1919.

The percentage of hogs retained for tuberculosis at the Chicago market has been reduced from 16.28 per cent in 1917 to 13.21 per cent in 1919. The percentage of hogs condemned for tuberculosis has been reduced from 0.34 per cent in 1917 to 0.21 per cent in 1919. If the percentage of condemnations in cattle killed at the Chicago market during the fiscal year ending June 30, 1919, had been as high as during the year 1917, 24,282 cattle would have been condemned or 9,830 more than were condemned during the year 1919—worth, at \$100 each, \$983,000. Had the percentage of condemnations in hogs at the Chicago market been as high as in 1919 (0.21 per cent) as in 1917 (0.34 per cent), the number condemned in 1919 would have been 28,424, or 10,535 more hogs than were actually condemned in 1919, worth, at \$40 each, \$421,400.

Lastly, tuberculosis in hogs comes almost entirely from cattle through infested milk and droppings. If the disease can be eradi-

cated from dairy and breeding cattle, it will disappear to a large extent from fattening cattle as well as from hogs. The sentiment throughout the country is favorable to the plan of testing all breeding dairy herds with tuberculin. There are a large number of farmers who have made application for the test, but it can not be given them because of a lack of Federal and State men to do the testing. A much larger appropriation is needed to carry on this work and we hope it can be made an annual appropriation until the disease is practically eradicated.

Now, gentlemen, if there are any questions you would like to ask me regarding this work, as far as I can give you any information, I will do so.

The CHAIRMAN. My understanding is that the item in which you are most interested is the one of \$500,000 for administrative and operating expenses?

Mr. BROWN. Yes, sir.

The CHAIRMAN. Thank you, Mr. Brown. May we have some information as to that item, and as to what is required?

Mr. SMITH. My idea is that you should have an adequate sum for indemnity?

STATEMENT OF MR. HOWARD R. SMITH, LIVE STOCK COMMISSIONER OF THE CHICAGO LIVE STOCK EXCHANGE.

Mr. SMITH. As I understand the situation, when this first came up many of us thought that the money required for the payment of indemnities should be greater than for the payment of expenses. I personally thought so, and I remember I talked with Mr. McLaughlin, of Michigan, and I thought it would take a good deal more money for the payment of indemnities for the actual cattle slaughtered than would be required for the operating expenses, the payment of salaries, etc. But we have, many of us, been fooled, for this reason: The price of beef has been very high, the highest on record in the history of the country, all during the year. Beef has advanced in the last 15 years nearly four times. Top cattle are selling in the Chicago market for \$21.50 a hundred. That does not mean the show cattle, but what we call the best cattle on the market. Beef has been selling very high and the salvage that beef men get or the proceeds they get from the sale of the salvage is high. I think you understand that about 80 per cent of all the reactors slaughtered pass for food; that is, according to our own statistics, at the Chicago market about 80 per cent of all the cattle which have tuberculosis, pass for food.

In other words, the disease is localized. Now, the facts are that beef brings almost as much as strictly healthy cattle would bring, and the result is this, that the farmers have been able to get a very good revenue out of that beef—what we call the salvage. And I think you men understand that the law is worded so that cattle that react on the test are appraised on the basis of the breeding value and the difference between the proceeds from the sale of the meat and the breeding value of the animal, that loss is borne, one-third by the Federal Government, one-third by the State, and one-third by the owner. I want to say to you gentlemen that that has proved to be a very valuable provision. The law is worded so that the loss

on the basis of the breeding or dairy value is borne one-third by the Federal Government, up to certain limitations. The Federal Government does not pay in any case to exceed \$50 as its share on a pure bred, or \$25 on a grade.

Mr. McLAUGHLIN of Michigan. Do you understand that the appraisal is on the breeding value alone?

Mr. SMITH. Yes; on the breeding value.

Mr. McLAUGHLIN of Michigan. Does the law require that?

Mr. SMITH. Yes; the dairy or breeding value, Mr. McLaughlin. It is worded so that it is limited to a rather small sum, but it is on the basis of the dairy or breeding value. Now, the difference between the value of the meat of the animal and the breeding value of the animal represents the loss sustained. I can put it in this way: Suppose I have a dairy cow that reacts and the appraisers value that animal at \$150 and that animal goes to slaughter and the meat passes inspection and the meat brings \$75, which is not unreasonable. Now, the difference between that value of the meat which I get and the \$150 which represents the breeding or dairy value of the animal means a loss of \$75 to me. The Government pays one-third of that loss, which is \$25; the State pays one-third of that loss, which is \$25, and I stand the other one-third. The Government does not pay more than \$25, no matter how valuable the animal is. If that animal had been appraised at \$200, I would not have gotten a cent more.

Mr. McLAUGHLIN of Michigan. The law, as I understand it, is as follows: That out of the money hereby appropriated, no payment of compensation for any tuberculosis animal destroyed shall exceed one-third of the difference between the appraised value of such animal and the value of the salvage thereof. I do not see anything about breeding value in there.

Mr. SMITH. It says appraised value.

Mr. McLAUGHLIN of Michigan. Yes, appraised value, for beef, for dairy, or for breeding purposes.

Mr. SMITH. The appraised value would necessarily represent the real value for whatever purpose it is intended.

Mr. McLAUGHLIN of Michigan. That is it, for whatever purpose. So are you entirely right in saying that that appraised value is for breeding purposes? That is the question I ask you; I do not think you are entirely right about that.

Mr. SMITH. I do not know that it is definitely stated in the law, but practically all of those cattle are breeding cattle or dairy cattle; there are practically no steers whatever, but they are practically all breeding cattle or dairy cattle. I think I am right in that, Dr. Kiernan, that nearly all of these cattle are breeding cattle or dairy cattle.

Dr. KIERNAN. Yes.

The CHAIRMAN. The contention was that it would not be necessary to protect steers.

Mr. SMITH. No. What I was trying to bring out was this, that the proceeds of the sale of the salvaged meat, being very high, have gone a long way toward reimbursing these farmers, and that the one-third of the difference paid by the Federal Government and by the State has not been as great as it would be if the meat were lower

in price. I think you see the point there, that the meat value of the animal has gone a long way toward reimbursing the owner and that the difference, representing the dairy or breeding value, is comparatively small and the result has been the money required for the payment of indemnities has not been nearly as great as we anticipated; while the money required for paying the operating expenses has, of course, been heavy.

Now, as I understand the situation, we found in Illinois that some of the Federal men, that their services had been discontinued, and naturally we made inquiry as to why their services had been discontinued. Other States were in the same situation. Through inquiry we found it was necessary because the operating fund was getting very low, whereas there was a little over \$800,000 left in the indemnity fund. Now, in order that the work may not be hindered, that it may proceed through the year, up to June 30, we are hoping that some sort of a resolution will be passed authorizing the bureau to draw on the indemnity fund for the payment of operating expenses. If that can not be done, of course the work will have to stop long before the end of the year and there will still be a good surplus in the indemnity fund. That is the point we wanted to bring out. Are there any questions on that. The details, of course, on that will be presented by Dr. Mohler or Dr. Kiernan, representing the bureau. I think possibly you may have questions to ask them a little later.

Mr. McLAUGHLIN of Michigan. One question naturally arises, and that is, how much of this inspection work should be done by the Federal Government. Some may think the work is of such a character that it does not require the highly expert work of officials of the department. The testing of cattle can be done by any veterinarian. Is it necessary and is it proper for the Federal Government to go into a State and do all that kind of work?

Mr. SMITH. I would like to say in that connection, Mr. McLaughlin, that the people as a whole look upon the work of the Federal testers as being about the best work that can be done along this line. There are, we are sorry to say, a good many local veterinarians whose work can not always be depended upon. If we ship cattle to Canada, the Canadian buyers insist upon Federal testing, insist upon the work being done by Federal men. And cattle that go into some of the States must be tested by Federal men rather than by State men. Now I understand it is the plan of the bureau to work out a scheme whereby many local veterinarians will be able to do some of this work, so long as their work remains reliable and good. That will probably be brought out later on.

The CHAIRMAN. Is not the State work generally accepted?

Mr. SMITH. The State Work is generally accepted; yes.

Mr. McLAUGHLIN of Michigan. You say when cattle are shipped from one State to another, they are only shipped and only accepted by the State into which they go after Federal inspection?

Mr. SMITH. Not all the States, but there are some States that want them tested by Federal men.

Mr. McLAUGHLIN of Michigan. I understood the State certificates were accepted quite generally.

Mr. SMITH. I say the State certificates are accepted quite generally.

The CHAIRMAN. Have you knowledge of any State certificates not being accepted in any other State?

Mr. SMITH. A few years ago some States would not permit cattle to be shipped from the State of Illinois.

Dr. MOHLER. Wisconsin was another.

Mr. SMITH. They would not take it at all.

Mr. BROWN. They would not take it during the foot and mouth disease; during that trouble they would not take the State certificates.

The CHAIRMAN. That is during an emergency, of course; which is different.

Mr. SMITH. That is true of the tuberculosis also, is it not, Doctor?

Dr. MOHLER. Yes.

Mr. SMITH. Some States will not accept cattle unless they are inspected by Federal men.

Mr. TINCHER. There is no experiment about the testing any more, is there?

Mr. SMITH. No; not to any great extent. The tests now are considered very reliable, but there are different kinds of tuberculin tests under investigation.

Mr. TINCHER. What I mean is, have you not gotten a test that is not an experiment?

Mr. SMITH. Yes, sir.

Mr. TINCHER. Any graduate veterinarian could make that test?

Mr. SMITH. Yes, sir; any graduate veterinarian could make the test.

Mr. TINCHER. Do you know any place where Federal men are making the tests now, and have, during the last year, made the tests?

Mr. SMITH. Where Federal men have been making the tests?

Mr. TINCHER. Yes.

Mr. SMITH. The Federal men are making the tests in nearly all of the States.

Mr. TINCHER. What do you mean by "Federal men"?

Mr. SMITH. Men employed by the Bureau of Animal Industry.

Mr. TINCHER. You mean they are actually making the tests?

Mr. SMITH. Yes.

Mr. TINCHER. I looked the matter up while at home and I found the tests being conducted there were being made by the local veterinarian, who was appointed by the State veterinarian.

Mr. SMITH. That is in Kansas.

Mr. TINCHER. And was being paid for making that test by the owner of the stock.

Mr. SMITH. Yes.

Mr. TINCHER. And all of the Federal money was being used for demonstrating, as far as my State was concerned, as far as I could find out.

Mr. SMITH. The situation is this: If a man in your State, Kansas, sells a breeding animal to some other State, he can have that animal tested by the local veterinarian if that local veterinarian is approved by the State authorities.

Dr. MOHLER. Right there, I wish to state that Minnesota has refused to take any cattle from your State, Mr. Chairman, unless the inspections are made by Federal inspectors.

The CHAIRMAN. How recently?

Dr. MOHLER. Over a year ago. Every dairy or breeding animal that goes into Minnesota from Iowa is inspected by a Federal inspector.

Mr. TINCHER. Here is the point I am making: Here we have a test which is no longer an experiment. If we have a serum or whatever you call it, a tuberculin, which is no longer an experiment, it does not make much difference whether one State sets itself upon a pinnacle and says "We won't take live stock from another State unless certain authorized men make the test" or not. For instance, I raise hogs; there is no occasion any more for the Government to appropriate money to make experiments with reference to hog cholera tests. I know how I can keep the hog cholera out of my herd; I know how I can be careless and let it get into my herd. But the Government has found a serum, and I am using that. Now, is not the tuberculosis test the same kind of a proposition, and if I want to follow the prescribed rules by your department I can get rid of tuberculosis in my herd of cattle and I can keep it out of there?

Dr. MOHLER. Many breeders are doing that through the employment of private veterinarians.

Mr. TINCHER. I suppose the theory on which the Government originally got into this thing was that they would benefit the industry by certain researches and investigations that would make it possible for a man to do that. But the Government can not eradicate by appropriations and can not hire enough men to wipe out the tuberculosis of cattle; that is, to go and do the testing of the herds to do that. They have to have the cooperation of the owners of the herds of cattle. Now, if it is no longer an experiment, and if we have the method for doing that, is it not about time to let the individual take some responsibility?

Mr. SMITH. I think I can answer that question, Congressman, and I say there are some breeders who are hiring their local veterinarians. Now, they are doing it for this reason: There are many breeders that have very valuable cattle, worth a thousand or two thousand dollars, and if they put those cattle under Federal or State supervision they have pretty nearly got to have them slaughtered, and they can not afford to lose those valuable animals. And they are doing it in a private way; they are hiring local veterinarians and segregating those reactors and keeping them on the farms to raise offspring, and later on they will have them slaughtered. Now, there is nothing objectionable about that. Every man has a right to do that, which is a very good way.

But in regard to private veterinarians I want to say this, that the reason some States will not accept the tests of private veterinarians is because we have found that a great many private veterinarians are not honest; they will do things in order to pass the animal, to give a certificate of health. They will sometimes do what we call plugging the test—it has been done frequently—by injecting tuberculin before the regular test is made. A very common thing among private veterinarians is to make out a chart and not take any temperatures at all. They are working for this man, and he wants to get the animal through, and the local veterinarians is paid a little fee for making up a false chart. That is the reason a good many States will not accept

the work of a local veterinarian. The Federal man can not afford to do anything of that sort.

The CHAIRMAN. But how about the State veterinarians and their assistants? They are the ones to whom I have reference. I think in my State the State veterinarian has an assistant in nearly every county in the State.

Mr. SMITH. We have in Illinois State veterinarians and assistant veterinarians. We have recently adopted a new plan in Illinois. The old plan was to have a sort of civil-service examination, and a man by answering certain questions could be put on the list as an assistant veterinarian. We had a lot of trouble with that plan; we had a lot of men on that list as assistant veterinarians who did dishonest work. At the last session of the legislature it changed that law, and we no longer have assistant State veterinarians appointed in that way. The State veterinarian now appoints as assistant State veterinarians men who are reliable and will do that work satisfactorily. We have to have men who are dependable men, who do strictly honest work in making the tests. When that is done they ought to accept State tests just as readily as Federal work, and I feel sure it is the plan to employ more and more of those local veterinarians who will prove themselves honest and capable. If a man sells an animal, he frequently hires his local veterinarian, but the local veterinarians, as yet, are not employed to any great extent in conducting the whole-herd tests. You see, in this work of eradicating tuberculosis we have got to test the whole herd to make any progress. You can not go in and test one animal or two animals; you have to go through the whole breeding herd and clean it up, and either slaughter the reactors or separate them. They usually slaughter them. That is the only way of making any progress in eradicating this disease. And to-day that work is being done to a large extent by Federal and State men, and it is planned to employ local men to a large extent in doing that work.

Mr. McLAUGHLIN of Michigan. The idea advanced by Mr. Tincher, of Kansas, is that it is the duty and entirely proper for the Federal Government to make the investigation and work out a plan and evolve ideas, principles, and so forth, that can be applied. When that is done, the application of them, after that, is simple, and it is a question of the physical labor and expenditure of money, and it is up to the local people to furnish that money and to do the work. I remember very well the statement made by Mr. Scott, of Kansas, formerly a member of this committee, and a very able man, who resisted the appropriation for work in the States in carrying out the plan evolved by the Federal Government, and he said that when the Government had worked out a plan and developed a principle, and there is no question about its successful operation, and there simply remains the matter of carrying out, involving the expenditure of money and work, that in his opinion it was up to the States to carry it out. I did not agree with him at the time as to the particular matter that was up before the committee, but the more we see of demands of States for Federal appropriations and the employment of Federal agents to go into the States and do the work the more I come to think that Mr. Scott

was right. It may be that this should be an exception in this case; perhaps the work is so big and there is such a general interest in it that it exceeds State lines and all that. But if Mr. Tincher is right, and you answered his question when you said there was no doubt about the efficacy of this testing proposition—if he is right about that, then it is simply a question of spending money by the States and hiring the right kind of men. And it does not seem to me that you answer the question when you say some of the State men are dishonest.

Mr. COOK. I think I can give Mr. Tincher a little information. Take it in Montana: We have what we call the tail test; the interdermal, I think, is the proper name for it. Many States will not accept that test. We can not ship into Minnesota and many other States. We think that test is all right; the other States do not think so and they want a Government test. If we ship into Canada, they won't accept our test there at all; they insist on a Federal test. I know some bulls shipped up there, tested by a man who was absolutely all right. He got them to the line and could not get them across. I went to Ottawa myself on behalf of the man (who was a friend of mine), but I could not do anything with them. They just absolutely refused to have anything to do with any tests made by any of the States. And we ship a great many cattle into Canada, and if the accredited herd system means anything at all, it means when you issue a certificate it is accepted anywhere.

Mr. TINCHER. Do you know the test that is approved by our department?

Mr. COOK. That is the subcutaneous test.

Mr. TINCHER. Yes. Now, I do not know just how we can help your trouble, if your State is using a different test which is not approved. It is not just clear to me.

Mr. COOK. Other States are using it, too.

Mr. TINCHER. I use the test approved by the Government. The veterinarian says it is all right. Just follow that out to its logical conclusion and see what would happen. Suppose we should say that no part of the appropriation should be used, because the Government has found a real test. Now right on that subject, Mr. Smith, you see I follow the test approved by the Government; I take the trouble to take care of my herd; my neighbor don't: Is it your idea that the Government can force him to do so?

Mr. SMITH. Not necessarily. I do not think it is desirable.

Mr. TINCHER. Say you could not eradicate the disease from cattle generally in the United States—you could not get rid of it (you could not anyway, so far as that is concerned, by reason of its being a germ disease).

Mr. SMITH. We can get rid of nearly all of it, Congressman.

Mr. TINCHER. I do not suppose in this serum appropriation because the disease is so prevalent, the germ is so prevalent—I do not suppose it would be contended that we would be able to appropriate enough money to entirely eradicate the disease.

Mr. SMITH. I just want to say on that, first, that all we know is that tuberculosis in hogs comes from cattle—almost all of it—and we know tuberculosis in fattening cattle comes to a large extent from breeding cattle, and we have every reason to believe we got this con-

tagion in this country from early importations from Europe of pure-bred cattle. Europe has a great deal of that disease, and those cattle were brought over here and they were sold to various breeders over the country and the disease was scattered. And I feel sure if we can go through those breeding herds and clean up those breeding herds you would see a big reduction not only in the breeding herds but in the grade cattle. It has already shown results.

Mr. TINCHER. Is it your idea for the Government to appropriate enough money—say I have 100 head of cattle in Kansas, is it your idea that I can have them tested without cost to me?

Mr. SMITH. Yes; by the State and Federal Government.

Mr. TINCHER. That any man who has a breeding herd can have it tested?

Mr. SMITH. Yes, sir.

Mr. TINCHER. Without any expense to him?

Mr. SMITH. Yes, sir.

Mr. TINCHER. Then you are not beginning to ask for enough money in this appropriation, are you?

Mr. SMITH. He should have the privilege of having his herd tested under State and Federal supervision.

Mr. TINCHER. Free of charge?

Mr. SMITH. Free of charge where he has his whole herd tested and where he signs up an agreement to abide by these regulations that have been provided, the sanitary regulations, etc. Now, the plan is very favorable for this reason, that it leads rather than drives. No man is compelled to have his herd tested, but the conditions are made such that he wants them tested; and if the testing is done free of charge and if the State and Federal Governments will share with the owner part of that loss, he is willing to have his whole herd tested.

Mr. TINCHER. When would you stop this law; when would you quit that; how long would you keep that up?

Mr. SMITH. It would seem as though it ought to be kept up until the disease is practically eradicated.

Mr. TINCHER. You can not eradicate a germ disease, can you?

Mr. SMITH. You can reduce it to a very large extent.

Mr. TINCHER. We have all had the experience with the cholera in hogs and things of that kind.

Mr. SMITH. Yes, sir.

Mr. TINCHER. How many years would you advocate keeping up this offer of a free Government test to all breeding animals in the United States?

Mr. SMITH. I believe, Congressman, if this work continues, say, for 10 years, you will see it down to a pretty low point.

Mr. TINCHER. With the money appropriated, it won't begin to be enough to offer that free test to all the breeding herds in the United States.

Mr. SMITH. It has been enough to cover something like 10,000 herds of breeding cattle this year.

Mr. TINCHER. That would not cover my congressional district, Mr. Smith.

Mr. SMITH. We are not encouraging the testing of all grade cattle. We are encouraging testing breeding herds, the thoroughbred herds, first, the seed stock. They are the most dangerous, and they

have the highest percentage of the disease. Further than that, these seed animals, as we call them, are scattered here and there over the country and they carry the disease with them. The general trend of the grade cattle is to the market, and they are not so dangerous; that is, the general trend of grade cattle is from the farm to the market, and they do not scatter the disease over the country. The pure bred cattle do scatter the disease, and I believe we ought to confine this work to a large extent to the pure bred herds first. Of course, in the grade herds, where we know it exists, we should extend this privilege. I believe that is the logical plan, to undertake the testing of the pure bred herds of cattle and those grade herds where we know the disease exists.

Mr. TINCHER. If you are right in that theory (and I do not doubt the figures at all given by the gentleman, that you have made a great saving in meat production)——

Mr. SMITH, Yes.

Mr. TINCHER (continuing). If you are right in that theory (and we absolutely know now, as a scientific proposition, how to keep cholera out of hogs, and we know there is not any comparison with the figures of tuberculosis as to the loss of meat produced in hogs every year by cholera), why not offer free to provide the vaccine and treatment of all the hogs in the United States by the Government?

Mr. SMITH. The Government is cooperating in vaccinating hogs.

Mr. TINCHER. A man raising hogs and observing the rules spends just so much money on every hog he raises to vaccinate it at a certain age.

Mr. SMITH. Really it would not be a practical proposition for a man to have his hogs vaccinated unless he knew they were exposed.

Mr. TINCHER. I differ with you there, that it is not a practical proposition to have the herd of hogs vaccinated. When you vaccinate every one of them at a certain age, that is the only way to have an immune bunch of hogs.

Mr. SMITH. I have herds in southern Michigan, and they are never vaccinated unless I know cholera is in the neighborhood.

Mr. TINCHER. That may be true in certain neighborhoods. Would it be practicable, within the next ten years, to have cattle that were not tested for tuberculosis, if you are going to eradicate that disease?

Mr. SMITH. To have cattle that were not what?

Mr. TINCHER. That were not tested for the disease.

Mr. SMITH. I think all the breeding cattle should be tested, because you can not tell by looking at the animals whether they have tuberculosis or not.

Mr. TINCHER. I wonder if the same situation does not prevail with cattle that prevails with hogs? It just occurred to me since we have been talking—I spoke of the fact in reference to our way of handling hogs in our locality—that the only safe way to raise hogs is to take them all at a certain age and have them vaccinated, and when we do that at a certain age we are going to be free of cholera. I presume that is not true of the locality you mentioned.

Mr. SMITH. No.

Mr. TINCHER. And probably that would be the same situation with reference to the cattle.

Mr. SMITH. Yes.

Mr. TINCHER. But we know the treatment for hogs, and any man can buy the vaccine for so much and have it administered. The Government found that out for us; we appropriated the money, and it has ascertained that treatment.

Mr. SMITH. Yes.

Mr. TINCHER. Now they have done the same thing with reference to cattle. The only thing worrying me is where we are going to stop. I am for the cattle and for the appropriations necessary, but it looks to me like an awful big proposition to appropriate enough money to give free tuberculin tests to all the cattle in the United States if a man wants it.

Mr. SMITH. There is this difference: You can always know when there is an outbreak of cholera, but no man can tell when there is tuberculosis in a herd of cattle until they are tested for tuberculosis. That is the only way to tell, to have a man go through the entire herd and make the test.

Mr. TINCHER. It is too late to tell with hogs after they get the cholera.

Mr. McLAUGHLIN of Michigan. We have been told by some scientific gentlemen that tuberculosis is not transmitted to the offspring.

Mr. SMITH. It is not, Congressman, ordinarily. A calf can be weaned from its mother and can be raised a healthy calf if it is taken right away. If it is left to nurse the dam, it is in great danger of contracting the disease from the mother, or if it is left in the stall and eats out of the same manger there is great danger of its contracting the disease. But if the calf can be removed from the cow it can be raised a healthy calf, and many are doing it.

Mr. TINCHER. It is exactly the same proposition as tuberculosis in the human being; it is a germ?

Mr. SMITH. A germ.

Mr. TINCHER. And there is not as much probability of eradicating it in the cattle as there is in the human family.

Mr. SMITH. I just want to give you the figures to show the actual progress that has been made in the last two years:

The following table, compiled from data furnished by the division of meat inspection of the United States Bureau of Animal Industry, shows the number of cattle and hogs slaughtered at eight Middle West markets, the number and per cent retained (tagged) for tuberculosis, the number and per cent sterilized and the number and per cent condemned because of this disease during the fiscal years ending June 30, 1917; June 30, 1918; and June 30, 1919:

	Total slaughter.	Retained for tuber- culosis.	Per cent.	Passed, sterilized.	Per cent.	Con- demned.	Per cent.

If the percentage of condemnations in cattle killed at the Chicago market during the fiscal year ending June 30, 1919 (0.57 per cent), had been the same as in 1918 (0.78 per cent), the number condemned in 1919 would have been 20,232 cattle or 5,680 more than were condemned worth, at \$100 each, \$568,000. If the percentage of condemnations in cattle killed at the Chicago market in 1919 (0.57 per cent) had been the same as in 1917 (0.94 per cent), the number condemned in 1919 would have been 24,382, or 9,830 more than were condemned worth, at \$100 each, \$983,000.

Had the percentage of condemnations in hogs at Chicago been the same in 1919 (0.21 per cent) as in 1918 (0.27 per cent), the number condemned in 1919 would have been 22,572, or 4,673 more than were condemned, worth at \$40 each, \$186,920. Had the percentage of condemnations in Chicago in 1919 (0.21 per cent) been the same as in 1917 (0.34 per cent), the number condemned

would have been 28,424, or 10,535 more than were condemned in 1919, worth at \$40 each, \$421,400.

The reduced percentage of condemnations on both cattle and hogs in Chicago in 1919, effected a total saving of \$754,920 as compared with 1918, and \$1,404,400 as compared with 1917, assuming that the losses on cattle and hogs retained for tuberculosis, but not condemned would offset the value of the salvage on condemned animals.

On the same basis of valuations, the reduced percentage of condemnations on both cattle and hogs at these eight markets in 1919 effected a total saving of \$2,136,860 as compared with 1917.

It is apparent that the tuberculin testing of herds of breeding cattle, the elimination of the reactors and the adoption of better methods of sanitation is reducing the prevalence of tuberculosis in both cattle and hogs.

For example, in 1917, 0.94 per cent of the cattle killed at Chicago were condemned for tuberculosis. In 1919, it was only 0.57 per cent. That is the best barometer of the conditions we have, when we get these reports from the division of meat inspection and see the actual conditions at these various markets. I have here all the Middle West markets, and the situation with reference to hogs in Chicago is this. The percentage of condemnations has been reduced from 0.34 in 1917 to 0.21 in 1919. Now, something is causing this to begin to go down. It had been coming up all the time until this appropriation was provided two years ago. I think the farmers are cooperating well. I want to say to you men that in my work as live stock commissioner I come in contact with men from all over the country, farmers and stock men, and they are all very greatly interested in this work of eradicating tuberculosis. We find the shippers and feeders are all of them anxious to cooperate. They realize it is a real menace to the live stock industry. And I maintain that the testing that has already been done and the improved sanitary conditions that have been brought about on our farms has been a big factor in reducing the prevalence of tuberculosis already. And that is the reason I do not hesitate to say if we can continue this work just the way we have been doing for 10 years, you will see, Mr. Tincher, that the situation is so well in hand in this country that it can be controlled. I had a herd of cattle in southern Michigan and I had it tested five years ago and wherever I found reactors I disposed of them and I have a clean herd and have had no trouble since. And I know any number of breeders who had that done.

Mr. TINCHER. Who tested yours?

Mr. SMITH. A Federal man.

Mr. TINCHER. Do you have him keep up the test?

Mr. SMITH. Yes; every year.

Mr. TINCHER. Is there a local man appointed by the governor?

Mr. SMITH. This work has been done by a Federal man entirely.

Mr. TINCHER. Sometimes the Federal man is a home man, too.

Mr. SMITH. Ordinarily the Federal man is stationed at some central point, and they go out and do the inspecting free of charge.

Mr. BROWN. From where was your inspector?

Mr. SMITH. Detroit. He is stationed at Lansing now. And I have a great deal of faith in this accredited herd plan which has been launched through provisions made by this appropriation. The accredited herd plan is this: It gives every breeder a chance to have his whole herd tested annually, and he simply signs up an agreement to have the Federal or State man to make the test every year, and if they find reactors they tell him to send them to slaughter

or else to put them off by themselves so they won't expose their cattle. If they own real valuable cattle they frequently like to keep them until they get some offspring from them, and they are allowed to do that, but if they have an accredited herd they must have no tuberculosis cattle on the premises. After they pass a second test and are shown to be free from the disease they get a certificate showing their herd is free from tuberculosis. When they have that certificate any breeder can ship cattle from his herd to any State of the Union without any special tests. Every State of the Union will take those cattle.

This is proving to be a very popular plan and breeders all over the country are making an effort to have their herds cleaned up. They lose something; the Government pays a small part of that cost, the State pays a part, and the breeder loses the rest of it. But he is willing to stand that loss to have a clean herd and the fact that he can make interstate shipments without restrictions gives him an advantage. I am confident the way this thing is going to-day that in a few years we will have tuberculosis practically eradicated from cattle, pure-bred cattle, and I am satisfied it will make a great reduction in the prevalence of the disease among grade cattle. The way the work has been going we feel it is most encouraging, and we simply want to give all these breeders an equal chance to have their herds tested. The facts are there are over 3,000 breeders to-day who have made application to have their herds tested and the Government and State men can not get to them. They have too many applications on their lists. And I believe we ought to keep this up, and it is going to take more men, but as long as the breeders are willing to have their herds tested I believe we ought to make every effort possible to furnish the necessary number of men to do that work.

Mr. TINCHER. What would you think of this proposition? We know what the test is; now, why not pass a law requiring before they can put their produce or stock in interstate commerce that they must make the test, that they comply with the law requiring that test individually.

Mr. SMITH. That is frequently required now. Every State requires a test.

Mr. TINCHER. Not for the produce, not for the butter.

Mr. SMITH. Not for the butter; that is true. For the produce that is not usually required, but any animals must be tested you know. Any cattle sold into another State have to be tested for tuberculosis before they can go into that State.

Now I would like to have Mr. Harding make a statement on this, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. Smith. I will ask Dr. Mohler a question first. I would like to call your attention to the note in the book of estimates. It reads: "It is only necessary to point out that during the month of July, 1919, the department expended approximately \$35,000 for salaries and expenses and only \$7,000 for indemnities, to show how the department is hampered by the restriction placed on the expenditure of its appropriation." \$35,000 would only be \$420,000, and we are giving the department \$500,000. I take it that is correct, Dr. Mohler?

STATEMENT OF DR. JOHN R. MOHLER, CHIEF OF THE BUREAU OF ANIMAL INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. MOHLER. This book of estimates was prepared back in August, so that the only month we had to base an estimate on was July. Since that time, for the first four months of the fiscal year, we have spent almost \$200,000. At that rate, we will spend \$600,000 this year, or \$100,000 more than the appropriation provides, which means we will have to lay off 100 inspectors between now and the first of July, in order to reduce our expenses about \$20,000 per month.

The CHAIRMAN. The estimates call for only \$1,480,440, and we gave you a million and a half last year.

Dr. MOHLER. We are asking now that the proviso which Congress saw fit to put in last year be stricken out, which proviso sets aside \$500,000 for operating expenses and \$1,000,000 for indemnities.

The CHAIRMAN. But, after all, the indemnities are the most important part; the inspection amounts to nothing unless you have money to reimburse the owner?

Dr. MOHLER. For the first four months of this year we have spent nearly \$200,000 for operating expenses and we have spent only \$52,000 for indemnities. At the prices which hides and meat of animals bring to-day, it has required an expenditure by the Federal Government of only \$29.19 per head for indemnities, so you can slaughter a great many animals and keep within the million dollars for indemnities at \$29.19 a head.

The CHAIRMAN. My recollection is the States appropriated about \$1,800,000?

Dr. MOHLER. Almost \$2,300,000.

The CHAIRMAN. I mean as it was presented to the committee last spring. I understand other appropriations have been made since, but at that time it was about \$1,800,000?

Dr. MOHLER. That is right.

The CHAIRMAN. And I believe you estimated you would require about \$700,000 for the operating expenses?

Dr. MOHLER. Fifty-fifty, we thought; \$750,000 each way.

The CHAIRMAN. And after consulting with you, the subcommittee decided to give you \$500,000 for operating expenses and \$1,000,000 for indemnities. We wanted to be certain that we were appropriating enough money to pay the indemnities. We were off on the estimates of the operating expenses; however, we accepted your estimates.

Dr. MOHLER. As I say, at the present rate we will expend \$100,000 more than the appropriation for operating expenses.

The CHAIRMAN. What would be your estimate next year for operating expenses?

Dr. MOHLER. As stated there in the book of estimates, we would prefer to have that left open.

The CHAIRMAN. That is rather indefinite.

Dr. MOHLER. Then to be more definite, we would rather have what the Senate put in last year. You remember after the House passed the bill it went to the Senate committee and the Senate committee made the recommendation of \$800,000 for operating expenses and \$700,000 for indemnities. That was passed by the Senate, but in conference the wishes of the House prevailed.

The CHAIRMAN. You can readily see it would not do any good to appropriate money for operating expenses unless we had money to pay the indemnities. The inspection would not be any good, because the cattle can not be slaughtered without paying the indemnity.

Dr. MOHLER. That is very true, but the best indication of what we need for the future will be what has been spent in the past. And as I stated in the first four months, July, August, September, and October, the indemnities which have been settled were only \$52,000.

The CHAIRMAN. The contention is that the free inspection should be limited to those who enter into this agreement.

Dr. MOHLER. That is true.

The CHAIRMAN. That is on a 50-50 plan?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. And outside of that a fee should be paid?

Dr. MOHLER. Yes, sir; in private practice, but the department permits no fees to be charged.

The CHAIRMAN. Is it not safe for the Federal Government to accept the findings of the States? For instance, a State tests the cattle and it agrees to pay on the basis of 50-50?

Dr. MOHLER. Yes, sir; we are accepting the findings of the States every day; we are cooperating with 45 of the 48 States and accepting their State men's work.

The CHAIRMAN. Do you cooperate with them in the inspection and testing, too?

Dr. MOHLER. Yes, sir; we cooperate in every way.

The CHAIRMAN. Is it not safe to accept the statement and findings of the State veterinarians?

Dr. MOHLER. Yes, sir; and, as I say, we are doing that; we are accepting the State men's findings; we are accepting their appraisements and their tuberculin tests also. We are cooperating in the full sense of the word with the State officials and breeders in 45 out of the 48 States.

The CHAIRMAN. How many applications have you for inspection now?

Dr. MOHLER. There are over 3,200 applications that can not be taken care of. Your State has 241.

The CHAIRMAN. They are willing to enter into this agreement?

Dr. MOHLER. 3,200 herd owners have made applications already that can not be filled and they are coming in every day. Instead of completing this work for them, we will have to stop it.

The CHAIRMAN. Is any of the work done by the States entirely?

Dr. MOHLER. No, this is all cooperative. The breeders enter into a contract between the State and ourselves that they will take care of the herd in the manner approved by the State veterinarian and the Federal inspector.

The CHAIRMAN. Can you not cooperate with the States and the State make a certain number of inspections?

Dr. MOHLER. That is being done right along, every day. The State is divided into zones, some of which are under the supervision of State men and other zones are under a bureau man. Each accepts the work performed by the other, so there is no duplication of effort.

The CHAIRMAN. How many inspections have been made altogether during the year?

Dr. MOHLER. The number of herds under the supervision of the various States and the Federal Government is 21,447, which include 421,264 cattle. The number of herds that have already been accredited is 1,391, containing 36,205 cattle. In addition to these, there are 16,341 herds that have passed one successful test and are on the road to be accredited. They contain 232,847 cattle. There are now on the waiting list, to be tested, 3,257 herds, containing 80,184 cattle.

This work is being done by about 181 of the bureau's veterinarians in cooperation with almost the same number of State veterinarians and assistant State veterinarians, and they are scattered all over those 45 States in the various areas. We do not have a man from the bureau go into the same territory where the State has a man, but we try to cover the entire State with a certain number of our bureau men and a number of men that the State veterinarian supplies. There is no duplication of effort in any way.

Mr. McLAUGHLIN of Michigan. And the State can do it?

Dr. MOHLER. The State can do it, and we accept all the work the State men do and they accept all the work the Federal men do.

Mr. McLAUGHLIN of Michigan. If the State fails to do it, though, you send a man in there?

Dr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. Then the greater the neglect of the State to do its duty, the more responsibility rests on the Federal Government?

Dr. MOHLER. That is true, but they have already paid more and appropriated more money than the Federal Government has appropriated.

Mr. McLAUGHLIN of Michigan. Why shouldn't they?

Dr. MOHLER. I am simply stating the facts.

The CHAIRMAN. How many inspectors did you say you had?

Dr. MOHLER. About 180 at the present time.

The CHAIRMAN. How many in each State; how many in Iowa, for instance?

Dr. MOHLER. About 7 in Iowa. We have cut the the force down by 20 in nine different States during the last 30 days.

The CHAIRMAN. How many are there in Illinois?

Dr. MOHLER. There are about 8 in Illinois.

The CHAIRMAN. They average about four to a State?

Mr. TINCHER. How many are there in Kansas?

Dr. MOHLER. There were six, but we had to take two men off.

Mr. RAINEY. As I gather it, the gist of the proposition is that Congress has appropriated a million and a half dollars for this work and limited you in operating expenses and the number of employees. You are now asking for an increase of a million dollars, about \$2,500,000, and you want that in a lump sum so that you will be able to have enough to go out and locate tuberculosis and you will not pay indemnities unless your inspectors locate the disease.

Dr. MOHLER. That is the point, but we can not locate the disease unless we have the inspectors, who may be termed detectives, to locate the trouble. And you may be paying just as much operating expenses to locate a healthy herd as to locate a diseased herd. If a herd is 100 per cent tuberculous, it costs the bureau no more to pay the operating expenses of the man to find that large herd of tuberculous cattle than if there were no tuberculosis at all in the herd.

The CHAIRMAN. If we omit that clause and make it all available for one purpose or the other, \$1,480,440 will be adequate? That is the estimate.

Dr. MOHLER. That is the department's estimate; yes, sir. These gentlemen have another proposition which Congressman Rainey just spoke of. There is nothing in the Book of Estimates about this \$2,500,000; that sum is what is presented there in the resolution. I do not want to get this confused in the record. What we are asking for in the Book of Estimates is the elimination of the phrase which limits the appropriation for operating expenses to only \$500,000, which is practically no more than what we had last year.

The CHAIRMAN. What was estimated by the bureau?

Dr. MOHLER. This year?

The CHAIRMAN. Yes.

Dr. MOHLER. Practically a million and a half dollars.

The CHAIRMAN. The bureau estimate was a million and a half? Was that cut by the Secretary?

Dr. MOHLER. \$1,480,440, the decrease being due to the transfer of \$19,560 in salaries to the statutory roll.

The CHAIRMAN. The Secretary allowed the bureau's estimate?

Dr. MOHLER. Yes, sir. The only difference is where some clerks were employed during the year and are now to be transferred from the lump-sum to the statutory roll, so it reduces—

The CHAIRMAN. I was trying to ascertain the amount needed to meet all your requirements.

Dr. MOHLER. That is the estimate, approximately one million and a half dollars.

Mr. TINCHER. If it is changed in that way, it would enable you to have at least double or three times the number of veterinarians that you have now?

Dr. MOHLER. Not three times, but we could double the number.

The CHAIRMAN. You can only go as fast as the States go; you just keep pace with the States, do you not?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. How many of your inspectors are devoting their time to the inspecting of animals for export and shipment to other States?

Dr. MOHLER. That comes under another provision here, under the provision for inspection and quarantine work. That is an entirely different proposition from this tuberculosis item which is for the purpose of the eradication of tuberculosis in herds in the United States. Our work on exports is done by the quarantine division and, as you know, we have inspected practically 11,000 dairy cattle to go to France in the first three months of this fiscal year. We had no money for that particular line of work, because we never exported dairy cattle before to Europe.

The CHAIRMAN. I mean shipping from one State to another or in interstate commerce?

Dr. MOHLER. That comes under this clause here.

The CHAIRMAN. That comes under this clause?

Dr. MOHLER. Yes, sir; but not the export.

The CHAIRMAN. How much of that are you doing?

Dr. MOHLER. We are doing a great deal. We have men at all the public stockyards to enforce the regulations about the interstate

shipments of dairy and breeding cattle. We have about 42 stockyards where that work is being done, and wherever the owners send in cattle to public stockyards we make the test free of charge. If we have to go around the country and make such a test, we charge the owner for the railway expenses and he has to put up the inspector at his home for the 36 hours required to make the tuberculosis test. All that work is being done under this appropriation of \$1,500,000.

The CHAIRMAN. It would be impossible for the department to respond to all the requests and applications for inspection for shipment in interstate commerce, would it not?

Dr. MOHLER. That is what Congressman Tincher just said. We are only doing a certain portion of that; the rest of it is being left to the States to do and the States are appointing their best local practitioners, approved by the State and O. K'd by the Government, and then the other States accept these tests. And the herd of this man the Congressman just spoke about, the herd of that man you referred to in your neighborhood, can go to any other State when accompanied by this approved veterinarian's health certificate.

The CHAIRMAN. Are you extending that service?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. To what extent?

Dr. MOHLER. We are covering every animal that is intended to go into another State for breeding or dairy purposes.

The CHAIRMAN. The purpose of this act is to exterminate the disease of tuberculosis and to get rid of it just as quickly as we can. I do not think anybody would stop at a few million dollars of expenditure if it can be exterminated; but when you go out in the field to inspect herds for export or interstate shipment, that is a different thing. I have been engaged in shipping for a number of years and I have never thought of asking the Government to inspect my herd or a carload of cattle when shipping to another State.

Dr. MOHLER. No, sir, we are not doing that.

The CHAIRMAN. We ought to leave a little bit to the States and to the shipper.

Dr. MOHLER. We are not doing that except at the public stockyards and for special shipments. For instance, if a breeder wishes to make a shipment to Canada, we go to his farm and he pays the traveling expenses of our man and puts him up overnight, because Canada requires a Federal certificate. And we do that for you in Iowa when you are going to ship to Minnesota, because Minnesota will not accept the Iowa State certificate.

The CHAIRMAN. They do not accept the State certificate?

Dr. MOHLER. No, sir; and we do not like it, because it is placing a great burden on us and is not getting anywhere, but it costs us both money and time.

The CHAIRMAN. Now, to be frank, I think the State of Iowa and every other State should provide the inspection. If they have not the necessary law, they should pass it. If they have not proper veterinarians, they should get them.

Dr. MOHLER. I am just referring to the exceptions. The regular plan and rule is for our men to be at the public stockyards to test for tuberculosis the cattle that are going to a breeder or dairyman in another State.

The CHAIRMAN. I agree with you on that, but I do not think it is possible to do it on every farm in every State.

Dr. MOHLER. We are not doing it except where we are obliged to do it by State laws, and we do not like to do it.

The CHAIRMAN. The inspectors employed in Iowa are located in Sioux City?

Dr. MOHLER. No, sir; the inspector in charge is Dr. Thompson, located at Des Moines, and the other men are scattered over the State. When the State sends their man we do not send our man; we are all cooperating.

Mr. McLAUGHLIN of Michigan. What I am speaking about is going out in a State and inspecting private herds, and you said you were not doing that unless you were compelled to do so by State law.

Dr. MOHLER. That is right.

Mr. McLAUGHLIN of Michigan. What do you mean by that?

Dr. MOHLER. I mean, as Mr. Smith has stated, certain States will not accept cattle from certain other States without a Federal certificate.

Mr. McLAUGHLIN of Michigan. Why?

Dr. MOHLER. Because the certificates that were coming with cattle from these tabooed States were considered to be of no value.

Mr. McLAUGHLIN of Michigan. The State inspectors have not been efficient in doing their duty; they have been dishonest?

Dr. MOHLER. I am not in a position to say that, but that is the interpretation of the other States. Illinois is not now but it was in this position several years ago, and a number of the western States would not take any cattle from Illinois without a Federal certificate. Prof. Woods just tells me that Maryland will not accept cattle from New York unless a Federal inspector has made the tuberculin test.

Mr. McLAUGHLIN of Michigan. Why?

Dr. MOHLER. I do not know. You will have to ask Prof. Woods about that.

The CHAIRMAN. Thank you, Dr. Mohler. We will hear Prof. Woods.

Mr. McLAUGHLIN of Michigan. The men in New York have not been doing their duty; they have not been honest, perhaps.

STATEMENT OF DR. ALBERT F. WOODS, PRESIDENT, MARYLAND STATE COLLEGE.

Dr. WOODS. That is the reason.

Mr. McLAUGHLIN of Michigan. If the State has the Federal Government to make the test and does not need to spend the money, does not that lead to more dishonesty among the States and the more Federal money is necessary?

Dr. WOODS. Our experience is the State is very loath indeed to have this quarantine issued against the State veterinarians. We had it issued against us once before we got our service up to the standard, and we hastily got it up to the standard, and it was only operative for about 30 days. Now we have issued it against New York, operative day before yesterday, simply because the New York State veterinarian service has been shipping plugged animals into Maryland. We have spent a lot of money to clean up the State of

Maryland, and we can not afford to have those animals shipped down here and reinfect our pure-bred herds which are now clean, and consequently we have issued this quarantine. New York, probably within 60 days, will find out these veterinarians who have been doing this sort of thing and will eliminate them from their list, and it is one of the most valuable educational methods to clean up the veterinarians as well as the herds that I know of.

Mr. McLAUGHLIN of Michigan. I do not see how you are going to educate them if, when you refuse to accept their dishonesty, the Government goes in and does the work for them. It seems to me it would be almost to the interest of the State to be dishonest, in order to have the Federal Government step in and do this work.

Dr. WOODS. The State can not afford to have that stigma upon the reputation of their service, and the fact is they do clean up as soon as a step of this kind is taken.

Mr. McLAUGHLIN of Michigan. Then, when the State realizes that, it gets to the front and does its own work, does it?

Dr. WOODS. Very largely; yes.

Mr. TINCHER. I do not think you could appropriate enough money to make New York be honest.

Dr. WOODS. It would be a very serious thing if it would not be possible to transport animals from New York to our breeding herds. There must be some means of doing that. We will only accept Federal veterinarian inspection up to the time New York gets satisfactory inspectors.

The CHAIRMAN. What would you say to charging a fee for making the Federal inspection?

Dr. WOODS. I think that would be all right, and I would like to say here—

The CHAIRMAN. In addition or outside of the regular salary men?

Dr. WOODS. Yes.

The CHAIRMAN. Of course, we should provide for men at these large shipping points, but, if it is necessary to have a man for every locality, I take it that the Federal Government could not afford to hire men to place in every one of the 2,900 counties, and I take it a county is about as big a territory as any one man can cover.

Dr. WOODS. It is absolutely necessary for all these pure-bred breeders to import animals from other States. They have to keep exchanging bulls, selling and buying, to keep their blood lines up and, in doing that, even after you get cleaned up, from those States that are not clean they are constantly introducing the disease, and for that reason we feel that some greater effort than the State has the power to put forth ought to be made to clean up the breeding herds, as Mr. Smith has said.

The CHAIRMAN. Inspection ought to be provided, there is no question about that.

Dr. WOODS. Our breeders would very much rather have a Federal man come in there and do the inspecting and cut out the indemnity entirely. The indemnity is hardly worth mentioning compared with the losses that a herd will sustain if they have to destroy 10 or 15 animals worth anywhere from \$500 to \$5,000 apiece.

The CHAIRMAN. Do you think we could make headway in eradicating tuberculosis without the indemnity provision?

Dr. Woods. I do not think we would have made any beginning on it, but the thing is going now pretty well and my own opinion is if you have to cut out anywhere, cut out the indemnity. I do not know about the experience of other men, but that is true in our State. In Maryland, if you have to cut off anything, cut off the indemnity; we will stand the loss. But we do want to know, when we stand the expense, that we are through, and we do not want some plugging veterinarian, for 50 cents, to come and plug a cow so she won't react, and to send us an animal from some other State that we can not depend upon. For that reason we have issued this quarantine against New York and won't accept any animal from New York State, unless she has a Government certificate, until they clean up.

Mr. McLAUGHLIN of Michigan. Two years ago we had quite a controversy here as to the amount of the appropriation, whether it ought to be \$250,000 or \$500,000. I think I have the amounts right. We were told by the Department of Agriculture that there was no need whatever of increasing the amount of the appropriation to \$500,000 unless measures were taken to provide an indemnity; there was no need of doing it at all unless we provided an indemnity.

Dr. Woods. I understand there is a constitutional limitation upon the destruction of property without paying for it, but I do not know why, if the owner agrees to stand the loss, that would not cover the constitutional prohibition.

Mr. McLAUGHLIN of Michigan. And following that very discussion in the House and Senate, over the question whether or not this amount should be increased from \$250,000 to \$500,000, the Senate added an amendment, a crudely drawn affair, to provide for indemnities; and the amount was increased under the statement from the officials of the Department of Agriculture that there was no need of increasing the amount unless indemnities were provided.

Dr. Woods. That was so 10 years ago, but I believe the breeders have realized the great importance of this move, and while they of course want the indemnity, they want the skilled supervision more than the indemnity. That is my opinion.

The CHAIRMAN. This matter was under consideration for a number of years, appropriations were withheld, a number of the members of the committee contended that there was no use appropriating large sums of money unless we provided a definite plan that would prove effective. We came to the conclusion the only effective way of doing it was to provide indemnities so we adopted the same plan as in the foot-and-mouth disease.

Dr. Woods. I do not want to be misunderstood. I believe the system you have is the most effective system that could have been devised to get this thing done. The breeders would not permit our men to come on their farms, and every herdsman of blooded cattle would say I am honestly in favor of this thing, of cleaning up the herd, but I can not afford to stand the entire loss.

The CHAIRMAN. Thank you, Dr. Woods. Now the question is, how far do we need to go; my question is how would it do to provide a part-fee policy? It seems impossible for us to provide inspection and testing for every farm—to take care of every shipment. What have you to say as to a fee system?

FURTHER STATEMENT OF DR. JOHN R. MOHLER, CHIEF OF THE BUREAU OF ANIMAL INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. MOHLER. I would like to say that what Mr. McLaughlin stated is absolutely true, namely, that this committee of the House, in 1917, did propose an appropriation of \$250,000 for the eradication of tuberculosis, but it had no indemnity feature in it at all.

The CHAIRMAN. I made the fight for it myself.

Dr. MOHLER. When asked about the indemnity, the Department of Agriculture's attitude was, if indemnity was to be allowed, \$250,000 would not be sufficient, but that \$500,000 would be needed if indemnities were to be included. The House bill provided for \$250,000, but did not include any provision for indemnities.

The CHAIRMAN. That was the first appropriation?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. Then we decided on this plan and gave you \$500,000, then we jumped to a million and a half. The question is, How much is required now?

Mr. TINCHER. You stated there were 3,200 applications for inspection?

Dr. MOHLER. Yes, sir.

Mr. TINCHER. Do you not know, as a matter of fact, that that is only a beginning, that those 3,200 applicants have reported to their neighbors that the fund is exhausted and they can not have it, and if it was possible for the Government to give the inspection, there would probably be an aggregate of 10,000 applications right now instead of 3,200?

Dr. MOHLER. I would not be surprised at all, Mr. Tinchler. This thing is growing by leaps and bounds and it is getting far beyond us. I want to say here, with reference to the possibility of eradicating tuberculosis, that I would like to go on record as asserting that tuberculosis can be eradicated in five-eighths of the United States in the next 10 years. I believe that in the State of Mississippi, which Mr. Candler represents, the disease can be eradicated in 10 years, and in a great many of the other Southeastern States as well. In Georgia, which Mr. Lee represents, I would like to have a contract to eradicate tuberculosis in 10 years. But when you come to some of those badly infected Northern and Central States, which I do not care to mention, I would not want to take a contract even for 50 years. I believe we should take part of the country and exterminate the disease, and we could exterminate it in a relatively short period of time in certain sections. Then we could put a quarantine on or a barrier around the badly infected States and tell them to enforce stringent inter and intra county restrictions on the movement of tuberculous cattle, if they wished our cooperation. But we have to be the leaders in this as well as in every other thing, like hog cholera and tick eradication. Where would the States be to-day if we had allowed these matters to take their own course?

The CHAIRMAN. Why is it possible in one State and not in another?

Dr. MOHLER. Because in one State they have a 33 per cent infection, where it has existed for years and years, and in other States, like Georgia and Mississippi, they have kept their native stock prac-

tically free from tuberculosis and only get the disease by buying pure-bred bulls and females from these badly infected States.

The CHAIRMAN. The further north you go the longer the cattle are housed throughout the year, and as a result the disease is more prevalent among them.

Dr. MOHLER. That is very true, and some of the Northern States are cleaner than other Northern States.

The CHAIRMAN. What do you say as to a fee system?

Dr. MOHLER. I am opposed to a fee system.

The CHAIRMAN. In conjunction with what we now have?

Dr. MOHLER. I am opposed to a fee system at all. I think it will be entirely unsatisfactory.

Mr. McLAUGHLIN of Michigan. There was a bill before the House Monday for the District of Columbia, providing for the inspection of all weighing apparatus of different kinds in all the stores and the measuring of containers and so on to see that they were exactly in compliance with the law; and it was urged that a fee be charged by the Federal inspector each time he made the inspection. The chairman of the committee, Mr. Mapes, read a long statement from the sealer of weights and measures of the District of Columbia, as I remember his title, against the fee system, claiming that it led to fraud and collusion between the inspector and the merchant whose machines were to be inspected, and that after a trial over a term of years the fee system had not been effective, and there was fraud and dissatisfaction, etc. What do you think of that?

Dr. MOHLER. That is very possible. You are running right into the personal element when you commence to allow an official to collect fees, and you are also running against the private practitioner who has to make his bread and butter in that same territory. The plan of the bureau is to keep abreast of this constantly growing list of requests, but to let these accredited herds go back to the practitioner in the locality where the herd is situated after they have been under Federal and State supervision for two years. And that is going to help solve the problem; we will turn over these accredited herds to the private practitioners with the idea that the local veterinarians will keep them clean and allow us to go into new fields.

Mr. McLAUGHLIN of Michigan. The fact that the inspection is optional with the owner of the herd, you might think he would not consent to have his herd examined and tested and run the risk of having it condemned; but you think he might consent to it if he had some assurance on the side, in a dishonest way, that he would give him a clear certificate if he paid the money?

Dr. MOHLER. That is a possibility.

Mr. McLAUGHLIN of Michigan. You think that would grow up under a fee system?

Dr. MOHLER. I am afraid it would. The personal objection I see to it is the fact that we will go right into the territory where the practitioners are located and compete with them by testing these cattle for a small fee. With the method I am speaking about, the accredited herd would only stay under Federal and State supervision for two years (but, of course, we would have the right to go in at any time and make a check test), and then it would be turned over to the practitioner in that community.

Mr. McLAUGHLIN of Michigan. The practitioner is in private practice and he makes a charge, I suppose?

Dr. MOHLER. Yes.

Mr. McLAUGHLIN of Michigan. Where State inspectors do the inspecting, do you know of any State where a fee is required?

Dr. MOHLER. No, sir; not with the tuberculin test, unless it is South Dakota. I know in inspecting for certain other infections—for scabies, glanders, etc.—a few States have a fee system, and there is a great deal of criticism of that method. I think that South Dakota has a fee system for tuberculosis inspection at the Sioux City stockyards. That has caused a great deal of criticism. In fact, we sent Federal inspectors to do the testing at Sioux City for that very reason, because we heard that the man was going around looking through the rails of the stockyards and the slats of the stock cars and then making out health certificates without applying any real tests. There is one of the advantages of this accredited herd proposition, because all of the States will take cattle from accredited herds without any further test and we will allow cattle from any accredited herd to go to any State in the Union, and Canada will also accept these cattle without additional tests. So there is a big advantage in making interstate shipments as a result of having a large number of accredited herds.

Mr. McLAUGHLIN of Michigan. This statement that one State will not accept a certificate by a State official and as to another State it will accept the certificate of the State official does not appeal to me. It is evident that where a State is honest and its officials have been doing good work the certificate is accepted, but where they have failed to do their duty and where their officials have not been on the square their certificate is not accepted. So that if the Government takes up that work and assumes to make the inspection in every State where the local inspectors have not done their duty, it is practically putting a premium on inefficiency and crooked work. If one State can inspect its herds in such a way that another State will accept its certificate all of them can be brought up to the same standard.

Dr. MOHLER. It might seem to work out that way, Mr. McLaughlin, but in reality it does not. Wisconsin has had seven States at various times refuse to take any charts from the practitioners of Wisconsin but that number has been reduced greatly. I do not know now whether there are more than one or two. Illinois was in the same position. There were four or five of the western States that refused to take any certificates from Illinois men. I do not know any that will now refuse to take the certificates from Illinois. This case Prof. Woods just spoke of is a new case to me. I am not surprised, however, from what information I have had from Maryland breeders. I do not think however that this deplorable condition is growing; I believe it is being greatly reduced. And I think what New York will do is to try to comply promptly with the requirements of the Maryland State officials so that they can ship anywhere on their veterinarians certificates.

Mr. TINCER. What you are asking for in this appropriation is to make the \$800,000 that was not used in paying indemnities last year, available for administrative purposes for the coming year and carrying practically the same appropriation we carried last year without

that restriction? Which will give you practically \$1,500,000 more for administrative purposes for 1921 than you had in 1920; is that right?

Dr. MOHLER. Yes, sir, practically so.

Mr. TINCHER. That would be, then, \$1,500,000 for administrative purposes. And what was it you had in 1920 for administrative purposes?

Dr. MOHLER. The whole thing is a million and a half dollars and we are asking now that we be given the privilege of using that money as we see fit.

Mr. TINCHER. That would give you four times as much in 1921 as you had in 1920?

Dr. MOHLER. No, because we got \$500,000 for operating expenses this year.

Mr. TINCHER. That is what I say, and then you have \$800,000 of this year's appropriation to be made available for next year?

Dr. MOHLER. What we are trying to do is to correct this condition right now. We are not asking that this \$800,000 be carried over to 1921; what we want is to have a joint resolution of the House and Senate making available the indemnity appropriation of the present fiscal year for this year's operating expenses; otherwise, we are going to have to transfer or dismiss 100 inspectors and we are going to have to disappoint most of these 3,200 breeders.

The CHAIRMAN. Are we to understand, then, that \$1,300,000 is to be used for testing and only \$200,000 for indemnities?

Dr. MOHLER. In this item here?

The CHAIRMAN. Yes.

Dr. MOHLER. No, sir.

The CHAIRMAN. Now, this \$800,000 would mean that you have \$1,000,000—

Dr. MOHLER. Yes; but we are going to expend, the way we have been going, only \$200,000 of that million dollars for indemnities which means \$800,000 will be turned back into the Treasury. I am not objecting to turning money back into the Treasury; I think it is a good thing; but we are given credit for having one million and a half for tuberculosis eradication, and the funds are tied up in such a way that we are not going to be able to spend more than \$700,000 of it.

The CHAIRMAN. But in the note here it states that you are spending \$35,000 a month.

Dr. MOHLER. That is only for the month of July.

The CHAIRMAN. How much do you expect to spend for the testing?

Dr. MOHLER. We will spend, at the rate it is going now, not \$35,000 a month, which was true in July, but \$600,000 for the year, since \$198,000 have been already spent in the first four months.

Mr. McLAUGHLIN of Michigan. \$50,000 a month?

Dr. MOHLER. Yes; it is at that rate, or \$600,000 for the 12 months, which is \$100,000 more than we can expend. The result will be that we will have to cut off 100 inspectors between now and the 1st of July unless something is done to remedy that condition.

Mr. McLAUGHLIN of Michigan. Then you only want \$100,000 more between now and the 1st of July?

Dr. MOHLER. Yes, sir; if we must keep within our present limits.

The CHAIRMAN. What you want is \$100,000 more between now and the 1st of July?

Dr. MOHLER. What I want is to eliminate this proviso that limits the appropriation for operating expenses to only \$500,000.

The CHAIRMAN. But that is a question for us to determine, and I take it Congress or the committee does not care to change that policy.

Dr. MOHLER. That is up to you, gentlemen; but you are asking what we want.

The CHAIRMAN. There is no reason why we should make \$800,000 available if only \$100,000 is required.

Dr. MOHLER. It will require \$100,000 to make up the deficit that is going to occur if we keep going at the present rate. We dismissed 20 men on the 1st day of November in order to cut down the expenses.

The CHAIRMAN. Then \$600,000 is required, and that is all that will be necessary?

Dr. MOHLER. No, sir; that is not all that will be necessary.

The CHAIRMAN. Just how much will be required?

Dr. MOHLER. What I would like to see done is to have this proviso eliminated this year by a joint resolution, so that we may use as much of the million-dollar indemnity appropriation as we may need for operating expenses. We won't use any more than we have to use.

The CHAIRMAN. Personally I want to give you every cent that is required, but it is not necessary to appropriate more than is required. If you will state the amount necessary for the testing and administration, so far as I am concerned I am willing to give it to you, but not one cent more.

Dr. MOHLER. To do that, I will go back to the figures which a year ago the other branch of Congress, the Senate, gave favorable consideration to, and these are \$800,000 for operating expenses and \$700,000 for indemnities. At the rate we are going this year, under present conditions, we won't spend near that amount in indemnities.

Mr. McLAUGHLIN of Michigan. It will only be necessary to release \$300,000 for the rest of the year?

Dr. MOHLER. That is right.

The CHAIRMAN. But you said you would only spend \$600,000.

Dr. MOHLER. No, sir; I say we have spent \$198,000 the first four months of this fiscal year. For July we spent only \$35,000. That leaves \$163,000 for the other three months. So that we were spending more than \$54,000 a month for the last three months.

Mr. HEFLIN. You state that one State will not accept the certificate of inspection from another State. Could you not help that work by cooperating with the State authorities in this way, by having inspectors appointed that you could give a certificate to of character and ability? For instance, let your department give to the State inspector a certificate reading like this: "This man's ability and character is such that an inspection by him will be accepted by us and should be accepted by all parties concerned."

Dr. MOHLER. Mr. Heflin, we do that now. We have a number of people in New York State whose certificates we will accept for interstate shipments.

Mr. HEFLIN. Do they have any certificate they can show publicly?

Dr. MOHLER. Yes, sir; they do.

Mr. HEFLIN. From you?

Dr. MOHLER. Yes, sir; from us. We approve of the men that are approved by the State people. As I say, I do not know the case Prof. Woods referred to. It may be one of the men we have approved; maybe not. But if we find this man is one we have approved or if we find a man who is not doing the work according to our methods, we will remove him, and we remove our own men sometimes. We do not have an infallible system ourselves. Our men are not all perfect. I am far from perfect myself. But we remove our own men when we find they are not working in accordance with our methods. And if we find it is a State man, we drop him from the list. This case that Prof. Woods referred to is where a man is evidently falling down; whether he is on our list I do not know. We have between 6,000 and 7,000 men in the 48 States approved by the State officials, and who are approved by us.

The CHAIRMAN. They inspect?

Dr. MOHLER. They inspect.

The CHAIRMAN. Do they charge a fee?

Dr. MOHLER. They charge a fee for inspecting interstate shipments from one State to another. There are almost 7,000 of those men cooperating with the bureau.

The CHAIRMAN. Their certificates are accepted?

Dr. MOHLER. Minnesota does not take them from those men we approve in your State, and Maryland won't take them from the men we approve in New York now. That is the present condition.

Dr. WOODS. There are one or two or maybe three or four of those men that the Government has approved that we have not gotten spotted yet. But this procedure will stop their doing dishonest work (and we have the evidence here) and they will be removed just as soon as we find out who they are.

The CHAIRMAN. They give the veterinarian more money to influence him?

Dr. WOODS. Here is a veterinarian and here is a man who wants his herd inspected. The herd owner wants his cattle to pass, and the veterinarian thinks it is all nonsense anyway, and he says, "I can take care of that for you." It is only a case of locating those dishonest assistants or locating those dishonest practitioners.

Mr. TINCHER. Take our State live-stock inspector: If he recommends a veterinarian in Kansas to you for a certificate, you give him a certificate?

Dr. MOHLER. No, sir; not in every case. Of course, in your State there are some graduates from nonrecognized colleges and when one of these men has been recommended we say to Mr. Mercer "This man is not acceptable to us."

Mr. TINCHER. He would not recommend anybody but a graduate?

Dr. MOHLER. They have to recommend somebody we will accept, and sometimes they recommend a man from a college not approved by the United States Civil Service Commission, the War Department, or the Department of Agriculture. We try to accommodate Kansas, because they have that big western territory, where they do not have very many veterinary practitioners. Some of these practitioners are from one of these nonrecognized schools, and we say to

those men we will allow you to take an examination and if you pass the examination, solely on the subject of tuberculosis, we will accept you for interstate testing.

Mr. TINCHER. I will ask you if it is not true that you know it to be Dr. Mercer's practice that he does not appoint a man a State man unless he is able to get you to approve him as a Government man?

Dr. HOHLER. Yes, sir; for regular State work. However, there are one or two fellows he thinks very kindly of, close personal friends of his, that we have not approved for interstate testing.

STATEMENT OF MR. HOWARD R. SMITH, LIVE STOCK COMMISSIONER OF THE CHICAGO LIVE STOCK EXCHANGE—Continued.

The CHAIRMAN. Dr. Smith, have you anything else to say?

Mr. SMITH. I just want to say, Mr. Chairman, that to my knowledge the States are making an effort to secure high-class men for this test work. In our State, in Illinois, we have recently changed the law. I think this will answer your question, Mr. McLaughlin. Heretofore, any man who passed the examination could become an assistant veterinarian. That examination does not include honesty; it is purely a technical examination. The result has been we have had a number of men in Illinois who have not been honest, as assistant State veterinarians, and the Illinois Legislature, last winter, changed the law and those men must now be appointed by the State veterinarian and the State veterinarian has authority to cancel the license of any man who proves dishonest. That is going to give us a good honest lot of men in Illinois.

Mr. McLAUGHLIN of Michigan. Is there any provision for punishment?

Mr. SMITH. He is simply dropped from the list and can do no more testing; that is all. He is taboo from any further testing.

Mr. McLAUGHLIN of Michigan. Is his license taken away from him?

Mr. SMITH. I do not know whether his license is taken away from him, but he is no longer an assistant State veterinarian. I think the States are all making an effort to meet this standard. In regard to this matter of—

Mr. McLAUGHLIN of Michigan. You said that would answer the question I asked?

Mr. SMITH. You mentioned the fact the State men are dishonest and the very fact the Government would do that work for them encouraged dishonesty. I believe that was the question. That is true until the States get a better lot of men, and I just want to say Illinois is endeavoring to get a better lot of men. That is all. I think that is true of other States, also. In regard to this other matter, I just want to call attention to a statement that was made and passed unanimously by the representatives of 12 national cattle-breeding associations in Chicago last week:

In view of recent orders from the United States Bureau of Animal Industry discontinuing the services of a number of field inspectors engaged in tuberculosis eradication work throughout the country, which action we find upon inquiry was made necessary because of a lack of funds for the payment of operating expenses, we, the representatives of the 12 American cattle-breeding associations—

That takes in all of the important associations, the Shorthorn, Hereford, Guernsey, Jersey, Holstein, and so on—

in convention assembled at Chicago, Ill., December 1, 1919, urge Congress to make some provision whereby the United States Bureau of Animal Industry may be empowered to draw on the indemnity fund for the payment of operating expenses in order that the work of tuberculosis eradication may be continued without interruption through the present fiscal year.

That is all we are asking for, is to draw on the indemnity fund for paying operating expenses.

Now, one of our men has to leave early and I would like to have a statement from Mr. Frank Harding, one of the best-known short-horn breeders in the United States. He is also secretary of the American Shorthorn Breeders' Association.

The CHAIRMAN. We will be pleased to hear Mr. Harding.

STATEMENT OF MR. FRANK HARDING, SECRETARY OF THE AMERICAN SHORT-HORN BREEDERS' ASSOCIATION.

MR. HARDING. Mr. Chairman and gentlemen, I will take a short time. As Mr. Smith has stated, I have a valuable herd of short-horns in both Wisconsin and Illinois, whose veterinarians have not been very favorably spoken of here to-day, and I am secretary of the American Short-Horn Breeders' Association. I would like to present what I believe is the general view of our breeders, of the American Short-Horn Breeders' Association, that tuberculosis eradication is very important and they approve of the work that has been done. And they have in mind this large waiting list of herds that are anxious to have free tests—accredited herds—and they are also advised without further funds this work will have to be curtailed, and they are very much interested in its going on and this arrangement made, if possible, to make this indemnity fund or such part of it as is needed available for inspection. They also believe that this work is of national interest.

Figures have been submitted to you that show, through the work of the department and the States cooperating, the reduction that has been made in the number of tubercular cattle in this country. The breeders of the country have been educated by this work that has been done. They possibly had different views and recommendations when this fund was provided, as it was, that more would be used for immunity and less for inspection; but they are so pleased with the work that they are anxious it should go on. It is naturally important and if it saves the cattle breeders of the country a large amount of money through lessened condemnations it is along the line of conservation and the lowering of the costs of living.

There is another point I would like to mention, because I have been in close touch with the sentiment, at least, and that is our export trade. The American Short-Horn Breeders' Association sent me to South American countries four years ago, because I told them I believed I could present points down there why they should buy our cattle as against Great Britain; that at least they would consider and give us a trial; and the result has been that since my return, although two years' interruption occurred on account of the war, we have sent over 200 head of shorthorn cattle to Argentina,

Uruguay, and Brazil. These cattle have all been Federal tested. To my knowledge there have only been two reactors out of that large number that I have personally supervised and sent through our association. Now, the results of shipments from foreign countries are very different than the shipments from this country, and the sentiment is getting strong in South American countries that they can come to North America and get clean cattle. We are able, through the results we have made in shipping pure-bred cattle to these South American countries, to insure them against the retest which is required down there. They do not accept the test of any country in the world; they only accept their own test after the arrival of the cattle and we are able, after the good results we have secured on the cattle shipped from the United States, to get a rate of 8 per cent.

Three per cent of that rate, approximately, is to cover the risks of transportation and the other 5 per cent the risk of death from any cause whatever, including reactions to the tuberculosis test, on the retest that is demanded by law in those countries. By comparison it is less than half and in some cases one-third of the interest rate charge from any other country. And that is the class of cattle that are wanted in South American countries.

I just thought that was a point worthy of bringing up, that if we want to build up our North American trade in those South American countries, which is possibly of advantage to all of our citizens in the way of export trade, the sooner we can get a practically free country, as far as bovine tuberculosis is concerned, the more of that trade we will secure.

The CHAIRMAN. When you speak about an accredited herd, that applies to those who enter into an agreement to slaughter or segregate?

Mr. HARDING. Yes, sir; or segregation. This meeting has been referred to in Chicago, on the 1st day of December, where representatives of these associations were present, and I have a resolution to present from these 12 registry associations. These registry associations were represented in this meeting by the three members of the board of directors of each association and the secretary of the association. The resolution reads:

As representatives of the 12 American cattle breeding associations, in convention assembled, Chicago, Ill., December 1, 1919, we indorse the action of the last Congress in providing an appropriation of \$1,500,000 for the eradication of tuberculosis—a disease that is causing a loss of millions of dollars annually for meat condemned and for cattle that die of tuberculosis on our farms.

We heartily approve and commend the plan adopted by the officials of the United States Bureau of Animal Industry cooperating with the State live stock sanitary officials in combatting this disease with the resulting that this menace which has heretofore been increasing in its destructiveness is now actually declining.

We urge that the present Congress provide liberally for the continuance of this important work, that a larger force of field inspectors may be appointed to take care of the increasing number of requests from breeders for the annual tuberculin testing of their entire herds, in the performance of which work the present force is inadequate.

We recommend and urge Congress to make an appropriation of \$2,500,000 annually, the entire fund to be available for the payment of either operating expenses or indemnities, as necessities may require, under the terms of the **law now in force.**

The eradication of tuberculosis will not only conserve for human consumption great quantities of beef and pork annually condemned as inedible, but will also encourage the production of both meat and dairy products.

That is signed by the representatives.

The CHAIRMAN. On what is the estimate of two and a half million which you speak of based—how did you arrive at that figure?

Mr. HARDING. That the work is increasing for the elimination of tuberculosis, and, to continue it all over the country, it would appear it is getting larger in volume and there is more work to be done.

Mr. JONES. That is for the organization expenses and indemnities?

Mr. HARDING. Yes, sir.

Mr. JONES. I thought you said your indemnity was down to about a minimum now. Is it getting less?

Mr. HARDING. I believe there is a possibility that some day the indemnities may increase. As Mr. Smith has stated to you, we have had the highest prices these last two or three years, this last year particularly, in the history of our particular business for beef cattle, and the people who are having their cattle condemned and are marketing them are not receiving any indemnity, from the fact that it is fully covered by the salvage value. The time may come when they won't receive as great an amount for salvage and more will be needed for indemnity. That is a conjecture and not a certainty, but the work is enlarging and the desire for accredited herds is increasing all the time.

The CHAIRMAN. Thank you, Mr. Harding.

Mr. TINCHER. What is your post-office address, Mr. Harding?

Mr. HARDING. 13 Drexell Park Avenue, Chicago, Ill.

Mr. SMITH. I would like to have a word from Mr. A. B. Cook, president of the American Hereford Breeders' Association. Mr. Cook is from Montana.

The CHAIRMAN. We are glad to hear Mr. Cook.

STATEMENT OF MR. A. B. COOK, PRESIDENT OF THE AMERICAN HEREFORD BREEDERS' ASSOCIATION.

Mr. COOK. Mr. Chairman, I do not think it is necessary to take up the time of this committee. I think that what has been done in the last two years proves that this is a very necessary work, and I know that the Hereford breeders feel that the department has accomplished wonderful results, and we do not think they should be hampered for the want of enough money to carry it on satisfactorily.

The CHAIRMAN. Thank you, sir.

Mr. SMITH. Mr. Shoemaker would also like to say a word. He represents the American Guernsey Association on the executive committee.

The CHAIRMAN. We will be pleased to hear you, Mr. Shoemaker.

STATEMENT OF MR. S. M. SHOEMAKER, OF MARYLAND, REPRESENTING THE AMERICAN GUERNSEY ASSOCIATION.

Mr. SHOEMAKER. Mr. Chairman and gentlemen, I do not know that I can add anything to what has already been said. I can fully indorse everything Mr. Smith has said, and I feel that your idea of cutting

off the inspections would meet with the violent opposition of about 99 per cent of the breeders with whom I have come in contact. They would, unfortunately, rather give up the compensation.

The intelligence with which this work has been carried on by the department has secured the confidence of the breeders; and it is a real tribute to the work of that department, the way the people speak of it, "Why, a bureau man made the test; there is not any question about it."

Now, the economic value of this thing, I think, is enormous. Its educational value has been tremendous in Maryland. We needed for the Federal Government to come and tell our people that our State officials were right. We have a prominent man in the State, and I spent several years as a member of our State board of agriculture endeavoring to convince him that the tuberculosis test was a necessity and it was breeding high-class cattle. He eventually realized the Federal Government would not get behind this thing unless there was something to it, and he had his herd tested and he lost 56 out of 59, I think, and now he is the most ardent advocate of the tuberculosis test to-day that I know of; certainly one of them. As I say, its educational value is tremendous.

Now, it may be entirely reasonable to cut off the compensation in the near future; it may be wise to charge a fee for these tests after a while; but I do not believe it would be good policy to do either one at the present time. You are educating the public in a way that I do not suppose it could be done in years and years. You are getting results. The people are cleaning up their herds and they are under pledge to keep them clean. I believe it is accomplishing a valuable work, good financially to the country, and I believe you should give the department all the funds they need for these inspectors.

I do not know that I can answer any questions, but I will be very glad to give you any information I have.

The CHAIRMAN. You and I agree as to the inspection; we ought to provide for the inspection and testing. But the question is, How much is required and how can it best be accomplished?

Mr. SHOEMAKER. I do not believe you can improve on the work the way it is being handled at this time.

The CHAIRMAN. I believe it would be impracticable at this time to provide inspectors in 3,000 counties, and I believe a county is probably as large a territory as any one person could properly handle. It would take a tremendous amount of money to take care of that work. I do not think it would be possible for us to go to the extent of testing in every county. Possibly it may be done in connection with a fee system.

Mr. SHOEMAKER. I think eventually you can require a fee without retarding the work, but I do not believe it would be a wise thing to require that just now—just as it was necessary to provide the indemnity to get the work started.

The CHAIRMAN. The subject has not been discussed in the committee; it was merely my suggestion in order to get the ideas of the breeders and the department.

Mr. SHOEMAKER. Its educational effect—instead of its working as the gentleman suggested, that the States lay down because the Federal Government will do it, as a matter of fact it is educating the

veterinarians in the States to the fact that they can not do that sort of work. Incidentally, of course, States are bringing pressure on them.

The CHAIRMAN. Of course we ought to leave a little for the States to do. This country is pretty big, and we ought to divide it up between the States and not undertake to take charge of all the things to be done throughout the country; and it occurred to me the State should meet us half way.

Dr. MOHLER. Maryland is doing that, Mr. Chairman, very nicely.

The CHAIRMAN. I take it most of the States are.

Mr. SHOEMAKER. Yes, most of the States are; they are all cooperating in this kind of work.

Mr. SMITH. Before I call on Mr. Munn, who is president of the American Jersey Cattle Club, I wish to say I agree with Mr. Shoemaker that the time has not yet arrived for discontinuing indemnities. It would drive out of business our young breeders, I think you will agree with me, that the young man who hasn't a lot of money, if he should put his herd under the supervision of the State and Federal Government and say to those people "Test my cattle and slaughter the reactors," it would simply drive him out of business to the detriment of the whole country, and we are not ready for that yet. These well-to-do men, the experienced men, can stand that loss, but the young breeder, the man with limited means, we have to protect. We simply want to take off enough of that rough edge so that the young man can stand part of the loss without driving him out of business, and that is what we are doing. They are anxious to clean up, but they want the support of the Federal Government and State to that extent.

Mr. HUTCHINSON. I am confused in my figures Dr. Mohler, and I am asking for information. If I understand it, the appraisal of the thoroughbred is \$150, and of the grade, \$75?

Mr. SMITH. No.

The CHAIRMAN. That is the maximum?

Mr. HUTCHINSON. That is the maximum.

Mr. SMITH. The maximum paid by the Federal Government is \$50 for the pure bred. That is true. The Federal Government does not pay to exceed \$50 on a pure bred and \$25 on a grade.

The CHAIRMAN. That is not the total loss?

Mr. SMITH. That is not the total loss.

Mr. HUTCHINSON. The meat is worth something?

Mr. SMITH. The meat is worth something.

Mr. HUTCHINSON. \$75 is pretty high salvage on a grade.

Mr. SMITH. No, the animal is appraised at its dairy value, as a rule, or breeding value. If the salvage is more, he gets nothing; but the salvage is never more.

Dr. MOHLER. The salvage per head has been \$41.20, that is the average.

Mr. HUTCHINSON. I understood Dr. Mohler to say the average was \$29 and some cents, the salvage paid by the Government.

Dr. MOHLER. That was not the salvage, that was the indemnity, \$29.19.

Mr. HUTCHINSON. The hide will bring more than that. The packers are getting \$19 for the hide.

Dr. MOHLER. The hide is included in the \$41.20 for the salvage. This \$29.19 is what the United States Treasury paid out per animal to the cattle owner. This \$29.19 indemnity is over and above the salvage of \$41.20 which the butcher gave the owner of the tuberculous animal as an average.

Mr. HUTCHINSON. I can not make my figures come together.

Mr. SMITH. I will now ask Mr. Munn to make a brief statement. Mr. Munn is president of the American Jersey Cattle Club and also president of the National Dairy Council from St. Paul, Minn.

The CHAIRMAN. Thank you, Mr. Shoemaker. We will hear Mr. Munn.

STATEMENT OF MR. M. D. MUNN, OF ST. PAUL, MINN., PRESIDENT OF THE AMERICAN JERSEY CATTLE CLUB.

Mr. MUNN. With reference to indemnities first, the States vary, as I understand it, in the method of payment. Minnesota, I think, is the most progressive State we have in connection with the accredited herd. I know so far as the breeders of our association are concerned we have more animals in accredited herds in Minnesota than in any State of the Union, and I think we have more animals of all breeds than any State of the Union in accredited herds. We have been kind of progressive out there in that respect. We do not pay anybody out there in accordance with what I understand from Dr. Mohler and Mr. Smith some States are paying. The law is there you can not exceed a certain amount, and \$150 is the limit for a pure-bred in Minnesota. The salvage does not go to the owner. If there is any salvage it is deducted from the allowance made by the State and the State gets the salvage.

To come back to the question of the appropriation, I do not know the relation which exists between the indemnity and the overhead and inspection, and I shall not say anything about that other than to suggest it seems to me the relation should be one which would carry on the work in the most satisfactory way; that is, you must have a salvage which will induce those who are not now having tests made of their herds to test.

And, of course, to get this test, you must have a sufficient fund to carry on the inspection work. And I agree with your chairman that there should be cooperation between the State and the Federal department in that respect. I do not think it is entirely wise to take it away from the State, because you will get more inaction in that way than in any other. At the same time, you have got to have the Federal Government lead in this work, and it seems to me it is largely a matter of food economics. And if you view it from that standpoint, our food comes from two sources; it comes from the land directly or indirectly and from the water, and most of it comes from the land; about 90 per cent from the land. And of the total expenditure for food, over 50 per cent comes from animals. Those are figures which are available and about which there can be no controversy. That means in protecting these herds, by the eradication of disease, you are conserving our sources of food supplies which, it seems to me, is the real question. Because if there is any lesson that has come home to us out of this war above any other, it is that the source of the food supply is the most vital thing we have to consider in our na-

tional welfare. And by eradicating a disease like tuberculosis and getting healthy herds, we are conserving our sources of food supply and the money expended by the Government in that respect is very well expended.

Whether it should be two and a half million, three million, or five million, I am not prepared to say. I am prepared to say this, however, that in my judgment you could not go too high so long as you can economically carry on the work. If \$2,500,000 will do that, \$2,500,000 it should be; if \$5,000,000 will do that, \$5,000,000 it should be. In other words, if we are going to clean up, let us clean up as rapidly as we can economically rather than to dribble along year after year. And if I had my say about it, it seems to me in fixing the amount, if I were a Member of Congress and on this committee, I would want to know how rapidly this work can be done and then I would fix the appropriation accordingly.

The CHAIRMAN. We are up against this situation: The heavy demands on the Treasury under the present condition, and the estimates of the department are less than \$1,500,000. The question is are we warranted in increasing that appropriation? What the committee would like to know is whether additional appropriations are absolutely required in excess of \$1,500,000. Judging from the action taken in the past, I feel sure the committee wants to meet the requirements in every respect.

Mr. MUNN. Those figures, of course, would have to come from the department. It seems to me \$2,500,000 could be very well expended.

The CHAIRMAN. But the department estimates less than a million and a half, or \$1,480,000.

Mr. MUNN. That is a matter of opinion. I look upon these expenditures a little differently, perhaps, than some. We speak in billions these days. Now, when we are conserving food, it seems to me that we should give consideration to the results rather than to dollars.

Dr. MOHLER. The Department of Agriculture does not say that is enough to do this work.

The CHAIRMAN. That is the estimate.

Dr. MOHLER. It is the estimate. In view of all the various activities of the department, and in view of the state of the National Treasury and other things, the Secretary of Agriculture did not feel that he should ask for any more than that million and a half. He is, of course, not opposed to any action which this committee might take for increasing any of the estimates if it so desires.

The CHAIRMAN. That is the figure arrived at, taking all the conditions into consideration?

Dr. MOHLER. Yes, sir; that is it. I did not want to have it understood that the department would object to an increase.

Mr. JONES. You understand the trouble the committee have in appropriating more than a department has asked for, do you not?

Dr. MOHLER. Mr. Lever wrote a letter to the Secretary last year on this \$500,000 basis, and asked the Secretary if he thought \$500,000 was enough, and the Secretary replied that he could spend effectively twice that much money.

Mr. JONES. I understand that, but I say you understand the trouble the committee would have in convincing Congress to appropriate more than was asked for.

Dr. MOHLER. They had no difficulty last year. They appropriated three times more than the Secretary asked for in that budget last year. The Secretary only asked for \$500,000 in the budget last year and your committee appropriated a million and a half. So that it is a similar condition this year to that which obtained last year.

Mr. TINCHER. Do you not suppose the Secretary took into consideration the fact, in making his estimates, that the receipts of the Government this year would probably be \$3,000,000,000 short?

Dr. MOHLER. That is one of the points I referred to, but I do not want it to be understood by the members of the committee that the Secretary has fixed that as enough money for tuberculosis eradication and would oppose an increase, if in your wisdom you considered it essential to the welfare of the live-stock industry.

Mr. McLAUGHLIN of Michigan. The chairman of the Committee on Appropriations and the chairman of the Committee on Ways and Means say we are facing an inevitable deficit of at least three billion and a half. A large part of that money comes from the income tax. The President has recommended the reduction of the income tax. He knows why, I suppose, but he has not told anybody. The Secretary of the Treasury has said there would be no deficit. He has said that more than once, that there would be no deficit, although these two chairmen have said there would be a deficit of about three billion and a half dollars. The Secretary of the Treasury has said, also, there would be no bond issue. He has said that several times that there would be no bond issue. When it was pointed out to him that some bond issue would be inevitable, "Oh," he said, "there will be a bond issue that the bankers will take." He said, "What I mean is, there will be no bond issue like the Liberty loan bond."

The CHAIRMAN. You should not say "bankers will take," but "bankers will have to take." That is the way to put it.

Mr. McLAUGHLIN of Michigan. So that this committee while it handles very small amounts of money, relatively, yet it is looked to to be as economical as it can be.

The CHAIRMAN. Personally, I believe this is the most important work the department has ever undertaken.

Dr. MOHLER. And the most popular

The CHAIRMAN. Personally, I would do everything I could to meet the situation. Thank you, Mr. Munn. We will now hear Mr. Brown.

FURTHER STATEMENT OF MR. EVERETT C. BROWN, PRESIDENT OF THE CHICAGO LIVE STOCK EXCHANGE AND OF THE NATIONAL EXCHANGE.

Mr. BROWN. If you will allow me to say a word, I think the live-stock commission men come in contact with the producers, and the farmers want this more than any other agency in any line of work. This work of the department is the most popular work that is being done by any branch of the Government, to my certain knowledge. I am speaking for the farmer direct.

I think the department estimated four years ago that the loss by tuberculosis as \$25,000,000 annually. Because of the appreciation in values of live stock, which has occurred during the war, I think we can estimate now, conservatively, that the loss by tuberculosis in food

animals will reach fully \$50,000,000. Now, if you can make an appropriation of two and a half million dollars that may save even \$10,000,000 to the producers of this country, it seems to me it is a corking good investment.

I want particularly to bring out one point that has developed in the controversy here this morning, and that is the Federal inspection on the point of confidence. I can speak for the 27 markets that I represent, and they are the largest live-stock markets in the country, that the Federal inspector has the entire confidence of the producer and the State inspector has not. That is true in all markets. I think any hampering or reduction of the inspectors under the supervision and employ of the Division of Meat Inspection, Bureau of Animal Industry, would be a great blow at the live-stock industry throughout the United States. I think this inspection is of much more importance than the indemnification. We feel, at the large markets particularly, great markets like St. Paul, Sioux City, Omaha, St. Joseph, Denver, and Chicago, where the man comes in to buy a carload of breeding heifers or cows, when they go out he wants the Federal inspector to inspect them, and it is under protest in most of those markets that he accepts State inspection. He does not want it. He wants to have Federal inspection. The Federal inspection has obtained the confidence of the country as against State inspection (more in the foot-and-mouth trouble), and, in a way, as compared with State inspection, that never can be eradicated in the mind of the producer, the farmers of the country. They felt that the Federal inspection was absolutely on the level; they felt that the State inspection was not. And I want to say, as representing these markets that I mentioned, and all the markets in this country, there is no bureau of the Government that has more the confidence of the people, every producer in this country, than the Bureau of Animal Industry has; and I hope there will be no restriction in any way on this inspection.

MR. CANDLER. Then, you think it is more important to look after the extension of the inspection than to take care of the indemnity?

MR. BROWN. I certainly do.

MR. CANDLER. And if there is to be any enlargement of either one or the other, it should be along the line of inspection and not along the line of indemnity?

MR. BROWN. I do, sir.

MR. CANDLER. That the producers—the breeders—would prefer to stand the loss, to some extent at least, as far as indemnity is concerned rather than to have the inspection curtailed in any regard?

MR. BROWN. I absolutely think so. And in saying that, I think I represent every live-stock market in the country. And I think it is borne out in the figures shown of the work in the last year, that the indemnification has not been drawn on the way the inspection has. The pure-bred breeders, the grade men, the fellow buying a load of cattle in a big market—he wants the inspection; he wants to be absolutely sure.

MR. CANDLER. Then you would favor the recommendation urged by Dr. Mohler that the limitation be taken off, so that the department may be allowed to use its discretion largely in pursuing the further extension of the inspection work and only utilize what is

absolutely necessary for the indemnity work, in order to keep up the encouragement as to the development of grade herds and the development of grade cattle?

Mr. BROWN. I certainly would. I think the Bureau of Animal Industry has the confidence of the people, and there has been no reason why that confidence has been shaken; in fact, every year that confidence grows. Every farmer who knows anything about this work has the utmost confidence in the Federal inspection.

Mr. TINCHER. Does the average purchaser, say, of a carload of heifers like you speak of, keep the cattle there at the market for the 36 hours required for inspection?

Mr. BROWN. They have to under the Federal rules, Congressman; that is a requirement.

Mr. TINCHER. When those cattle are inspected, who takes the loss?

Mr. BROWN. He takes the loss; the animal is thrown back—has to be thrown back and killed.

Mr. TINCHER. The purchaser takes the loss, does he?

Mr. BROWN. Yes, sir.

Mr. TINCHER. No inspection of heifers shipped on to the open market is required?

Mr. BROWN. No. Where they are shipped on to the open market, that is not required; but where they go back into the country for breeding purposes, they are obliged to inspect; and they are followed back on to the farm, and when they come back on to the market. For instance, they are also inspected for commercial purposes, for feeding purposes, to see there is no shutting down out on the farm in the country. The department watches that, and the State inspectors also watch that.

Mr. TINCHER. When he buys cattle he has the Government man inspect them?

Mr. BROWN. Yes, sir.

Mr. TINCHER. And the point you make is he wants an authorized Federal inspector's certificate?

Mr. BROWN. Yes, sir.

Mr. TINCHER. That encourages him, if the market has that inspector, to pay the price for the heifers?

Mr. BROWN. Yes, sir; and when that animal goes back into the country, the farmer is so much more encouraged or pleased with that Federal inspection, than he is with the State inspection, that that herd is worth more money.

Mr. TINCHER. It would not take many inspectors to accommodate all the markets?

Mr. BROWN. No; it does not. The fact is that they are right there; they do not have to travel around the country; they are right there when that load or two, or three loads of stuff goes out, perhaps 10 or 15 or 20 a day, and they are right there where they inspect that stuff, and they do it right on the spot.

Mr. TINCHER. And there are not enough stock markets like you mention so that it would take any great number of inspectors?

Mr. BROWN. No. That inspection should not be hampered in any way, but should be increased. As Dr. Mohler could tell you, I think all of the markets now are asking for more inspectors, and that is the inspection that really counts more than anything else, because it is the dissemination of these animals all over this country.

Mr. TINCHER. It is the inspection that costs less?

Mr. BROWN. Yes.

Mr. TINCHER. And it is this traveling around over the country that represents the largest cost?

Mr. BROWN. Absolutely.

Mr. CANDLER. You believe it would be better to take away the limitation and leave it to the discretion of the department itself to utilize the funds where they will do the greatest good to this industry?

Mr. BROWN. Absolutely.

Mr. MUNN. Did you say the loss was stood by the man buying them?

Mr. BROWN. On the reactors.

Mr. MUNN. I do not want to throw discord in here. I agree with what has been said about the inspection where the animals go back to the shipping point, to the farm, but I can not say to do away with the indemnity and just have the inspection alone, because you could not reach the source of trouble that way. These animals come to the terminals and some go back again. They all come from the farms to the cities, and there is where the diseases start, and if you are going to eradicate it, you have to go back there to eradicate it. Of course, the city detects it by inspection at the yard and that is highly important to see that those animals do not get back on the farms. But if you are going to eradicate this disease, you have to inspect on the farm to do it, and you can not get condemnation on the farm if you have inspection alone, because the farmer won't allow his cattle to be inspected.

The CHAIRMAN. I think we all agree we should provide indemnity.

Mr. BROWN. I do not want to be understood as stating the inspection should stop altogether, but I want particularly to impress that this work at the terminal market, where the stock is going back to the country, is one of the most important.

Mr. MUNN. I think that is one of the most important where the stock is flowing back to the farm.

The CHAIRMAN. The question is on going onto the farms, visiting every farm, and making the inspection and test.

Mr. TINCHER. It is conceded that the Government can not appropriate enough money to have complete inspection of all the cattle on all the farms. What would you think of this as a fixed definite policy: That we do furnish sufficient inspectors for the markets and let the States understand that the Federal Government is furnishing sufficient inspection for the markets and the owners of the cattle understand the Federal Government is furnishing sufficient inspection for the markets, and then, in order to insure good markets for their own cattle, the State will have to exercise care, and the owner of the cattle will have to exercise certain care or he will be up against the proposition that the Federal inspection in the market will actually reduce his price in view of the fact that the Federal Government can not defray the total expense. What would you think of that as a policy?

Mr. BROWN. That is the policy strongly favor and, as far as the appropriation will stand, I also hope they will cover the farms as much as they can. But I think we all agree that the inspection at

the great public markets where the stock is disseminated through the farming districts is of paramount importance. Of course, the pure-bred breeders may differ with me on that.

(Thereupon, at 12.40 p. m., the committee took a recess until 2 o'clock p. m.)

The committee reconvened, pursuant to the taking of the recess, at 2 o'clock p. m.

FURTHER STATEMENT OF MR. A. B. COOK, PRESIDENT OF THE AMERICAN HEREFORD BREEDERS' ASSOCIATION.

The CHAIRMAN. Please give your full name and address to the stenographer.

MR. COOK. A. B. Cook, president of the American Hereford Breeders' Association, Helena, Mont.

I have been thinking of the appropriation that the department has asked for, which, as I understand it, is something like a million and a half of dollars. Am I right in that, Mr. Chairman?

The CHAIRMAN. Practically, in round numbers.

MR. COOK. The States within the last year have appropriated something over \$2,200,000. The breeders met during the International Live Stock Show, and it was the unanimous opinion of all the breeders present that it would take more money than they had been getting for the department. As I understand it, there are a little over 3,000 herds that have requested to be tested, and you can not do it for want of money. I know that the word has been passed out throughout the country that it no use making application, because they have not the money to do it with. I think it is fair to say that if it was known that there was money there would be fully five times that amount, and maybe ten times. It is hard to estimate what it should be. I do not think that you should curtail Dr. Mohler and his department and shut him off on money to carry on this work. I do not think it is fair to the breeders. He certainly can not give us results unless he has the money to do it with, and I think it is up to this committee to try and get him that money; and I am positive from what he said this morning as to what his requirements would be, and the way it is increasing, that \$1,500,000 will not be sufficient.

The stockmen and the farmers pay a good part of the money that is raised in this country, and I think that we are entitled to that much recognition. We are paying a good part of this money and I think we are entitled to a little recognition that way. Thank you.

MR. McLAUGHLIN of Michigan. You speak of the amount of money that the States have appropriated. Do you know how that is divided—how many States there are and the amounts that they have appropriated?

MR. COOK. I think every State in the Union, with the exception of Colorado and Delaware, has appropriated. I have not the figures handy. I think that is right, Prof. Smith? We were discussing it this noon.

MR. SMITH. I wrote to all the States.

MR. COOK. You wrote to all the States and got the total amounts, and at that time what it would be. Two years ago in our discussions here it was asked if the States would do their parts, and almost

every member thought that his State would be willing to help out and go 50-50 on the proposition.

Dr. MOHLER. All of the States, with the exception of Arizona, Arkansas, Colorado, and Louisiana, have made appropriations, totaling \$2,211,850. I have a list here of the different States.

Mr. McLAUGHLIN of Michigan. Is that for this particular work?

Dr. MOHLER. That is solely for tuberculosis eradication, in cooperation with the Federal Government. If you want to know about any particular State, I shall be pleased to tell you. Your State, Mr. McLaughlin, has appropriated \$100,000 per annum for this work.

Mr. McLAUGHLIN of Nebraska. What has Nebraska appropriated?

Dr. MOHLER. \$37,500 per annum.

Mr. MCKINLEY. How much is Illinois's appropriation?

Dr. MOHLER. Illinois, \$50,000 per annum.

Mr. JONES. Give us Pennsylvania. We will get them all in.

Dr. MOHLER. Pennsylvania, \$100,000 per annum.

Mr. McLAUGHLIN of Michigan. Have you a list that you can put in the record? Put in the whole thing.

Dr. MOHLER. Yes, sir; but I am going to speak on this later, and I thought I would put it in then.

The CHAIRMAN. Will you go on now, Doctor?

Dr. MOHLER. Would you not prefer to take care of these men first?

The CHAIRMAN. I understand that they have finished. Is there anybody else, Mr. Smith?

Mr. SMITH. I do not think so.

The CHAIRMAN. Thank you, Mr. Cook. Now, Mr. Kiernan.

STATEMENT OF MR. J. A. KIERNAN, CHIEF OF THE TUBERCULOSIS ERADICATION DIVISION, BUREAU OF ANIMAL INDUSTRY, DEPARTMENT OF AGRICULTURE.

Mr. KIERNAN. Gentleman, the tuberculin test was discovered in 1892. It has been in operation in this country from that time. Veterinarians in every State have been educated on the technique of the tuberculin test and have been applying it in every State.

Notwithstanding the efforts of the individual veterinarians and the individual live stock owners of the United States, however, tuberculosis has spread to practically every State in the United States. In the older dairy States it is more prevalent than it is in the newer States and in the range States; but, nevertheless, it is spreading from State to State, and the meat-inspection regulations show that for a period of 10 years it was spreading among swine at the rate of 10 per cent a year, so that for 1918, out of every 40,000,000 swine slaughtered at the establishments where meat inspection was maintained practically 4,000,000 of those hogs were affected with tuberculosis.

It became so alarming that the live stock owners of America said: "Something must be done to control and eradicate tuberculosis, if it can be eradicated, because if it goes on at the rate at which it has been progressing for the last 10 years, the time will come when all of our swine and also all of our beef herds in the United States will become affected with that thing."

The live stock owners came here to Congress two years ago, and Congress provided a small appropriation to carry on this work. There was no work done, from a national standpoint, up until two years ago. The only work that was done by the Federal Government up to that time was the eradication of tuberculosis from cattle in the District of Columbia. That work has been carried on for several years, and it has proven beyond a peradventure that tuberculosis can be eradicated from live stock. Here in the District they had, at the inception of the work, practically 19 per cent of the cattle infected, and each year the disease has been diminishing, and last year the official tests showed that very much less than 1 per cent of the total number of cattle in the District were affected with the disease; and the department feels confident that the disease will be totally eradicated from the District.

Now, with this appropriation that you made the Bureau of Animal Industry in its work started from the ground floor without any State cooperating, and in two years the work has been built up so that to-day there are 45 States engaged in this work, cooperating with the Department of Agriculture, and it has been mentioned here to-day, those States have appropriated an aggregate of \$2,200,000 for tuberculosis work this year. There were 33 States last winter where the legislatures met and considered tuberculosis work, and there were only two of those States that did not make appropriations. They were the States of Colorado and Delaware. But since then in the State of Delaware they have obtained a fund of \$15,000 or \$20,000 from private sources to carry on the work, so that they could carry on the cooperation with the bureau.

The plan of this work as set forth to-day is the eradication of tuberculosis from pure-bred cattle, the plan known as the accredited herd plan. That plan is in operation in 45 States, and that it has been a success is borne out by the testimony of the gentlemen who appeared here to-day representing every pure-bred cattle association in the United States.

In addition to the pure-bred herds, of course, we have got to look after the grade herds—the farmers' herds.

Last year when the breeders and the State live-stock sanitary officials and Dr. Mohler and the other bureau men got together in Chicago, we came to the same conclusions. And I want to emphasize, gentlemen, that this is our plan of cooperation, not a coercive measure, but we are working together in this eradication work, the farmer, the State official, the pure-bred breeder, and the Bureau of Animal Industry are going as one man in this campaign as has been shown here to-day; there is no contention between them; there is no division of plan.

The plan is "Now we have got together and we are going to stick together until we control and eradicate this disease"—gentlemen, we have made a canvass on this proposition. There are upward of 3,000,000 square miles in the territory of the United States, and of that vast area, two-thirds is comparatively free from tuberculosis. It exists to such a minor degree in two-thirds that the department is confident that in 10 years it can free that area, as Dr. Mohler said this morning, and preserve that area from tuberculosis. And what is that area? A large part of it is the Southern States, where there is the greatest development of live-stock industry growing in that territory that there is in any section of the United States to-day.

At the International Livestock Show, Mr. Chairman, where you visited last week, from the Southern States, where 10 years ago they did not raise anything but a \$10 cow, they produced this year the grand champion short-horn of America, the grand champion Hereford of America, and the grand champion Angus of America. It is in that territory that the live-stock industry is developing, and it is just as important for the United States Government and for the State officials and for the live-stock owners in general to preserve that territory free from tuberculosis as it is to develop any branch of agriculture. We can do it to-day at a very much cheaper rate than we will ever be able to do it, and by our precautionary measures to keep tuberculous animals out of that territory we are going to preserve at this time that territory in which the greatest advancement of the cattle industry will come about in the next 10 or 20 years.

The balance of the territory, as Dr. Mohler says, is a different proposition. Tuberculosis exists in it to the extent of from 5 per cent to 30 per cent among the cattle.

Only a month ago I was up in Otsego County, N. Y., where they have 5,500 farms, and where they have cattle on 5,000 farms. I went before the county bureau there and discussed tuberculosis. I told them, "Gentlemen, we are not coming in to ask you to create any new laws or to put any coercive measures on the people of this county. We are putting up the proposition to you that tuberculosis is a menace to the live-stock industry, and therefore a menace to the whole United States; that tuberculosis can be eradicated; it has been demonstrated. It is up to the people of this county if you desire to eradicate the disease; and the State will cooperate with you, and as far as possible the Government will cooperate with you." They adopted the tuberculosis accredited herd area in that country as a five-year plan for eradicating the disease.

Gentlemen, the place to eradicate tuberculosis is back on the farm, and the only way to do it is by taking the herd as a unit. You might work from now until the end of time, tuberculin testing cattle at public stockyards, where you get only one animal out of a herd or only two or three animals out of a herd. That does not eradicate tuberculosis if it exists in the herds back home. The place to eradicate tuberculosis is back on the farms, and the farmers of this country have shown their willingness and their appreciation of the opportunity of cooperating in this measure in the extermination of the disease by going to their legislatures and getting appropriations of \$2,000,000. This is a new work, two years old. It has met with almost universal approval. They are engaged in it in 45 States, and we know that within the next year or two the other three States will be actively engaged in the work. It is only a proposition of keeping pace with the demands for the work. Of course, it is the right of the States to look after the live-stock industry in the States; but this is a national proposition. Cows that are in one State to-day may be over in another State to-morrow, and unless you control this disease of tuberculosis, it is no respecter of State lines and it will go across.

The people have demonstrated that they want this work, and when I had the pleasure of coming here before I remember some of the members stated that it ought to be done on the cooperative basis. That is what we have undertaken to do, and I believe that it is on a cooperative basis, it is on a logical basis, it is on a plan that if

carried out can not help but succeed in eradicating tuberculosis, or reducing it to a very small percentage.

There was some mention made this morning about employing the services of private veterinarians. Our plan for this work is, we recognize the fact that Congress will never, and probably it should not ever, appropriate a sufficient amount of money to employ enough officials to go around the country testing all the cows, and supplemented by congressional appropriations. The 48 States would never appropriate a sufficient amount of money to go around and test everybody's cows, and I do not think it right that they should. But it is necessary to make a demonstration in all these States and to get this thing on a working basis.

We contemplate under this accredited herd plan—and that is the plan adopted by the breeders and approved of by every State in the United States and by the Bureau of Animal Industry—that after a herd has been accredited two years, that herd may be turned back to the private veterinarian and the department get rid of that herd, so as to be able to take on new herds. The private veterinarian will be paid by the private individuals.

In addition to that, as Dr. Mohler said this morning, there are about 6,000 private veterinarians in the United States who have been approved of to test cattle for interstate shipment. We contemplate that the time is coming when these 6,000, or maybe 10,000, of the veterinarians of the United States will be engaged in this official work of eradicating tuberculosis, not paid out of the Government's funds or paid out of the State treasuries, but paid by the owners. And we are building along those lines, getting everybody acquainted with the work and building up efficiency of the veterinarians throughout the United States, so that in time they can serve the purposes for which they were educated and help in the control and eradication of the diseases.

Another project in this work is the eradication of tuberculosis from an area. Take a county, for instance. In several States we are now engaged in the eradication of the disease from a county. In the State of Mississippi, in Hinds County and Clay County, the people voted on the proposition there, "Shall we eradicate tuberculosis from livestock?" By very substantial majorities that was carried in both elections, and they are so engaged in the eradication of this disease from those counties. After they clean up the disease in those counties, then they will have to be protected from the infection of cattle from other States. And another advantage is that after they clean up the disease from those counties the work will spread from county to county until it embraces a large area of the State, and probably the entire State; and then, when that area is clean, the county, or a group of counties, or the entire State, may become clean; then the interstate shipment of cattle from that territory may be permitted without any further tuberculin testing.

So that you see it is all working to that time when the interstate movement of cattle can be facilitated without restrictions. That is what we are working to. But until that time comes every State and every breeder must exercise eternal vigilance to prevent, as far as possible, the movement of diseased animals from one State into another.

In the Western States, in the arid section of the West, tuberculosis is not known among the range cattle, or it exists to a very insignificant degree. The only place you will find the disease there is down in the valleys where they started little dairy herds and brought cattle in from the older dairy States. There you will find a good deal of the disease. So that it is in those areas we must put forth the great effort to free them from what little disease there is, and then preserve them free from tuberculosis, and in the other areas carry on this work according to the demands of the people. That is the whole plan we have in mind; not to get any drastic laws and make it compulsory to have animals tested, but to build up among the live-stock owners of America a confidence in the ability to control and eradicate this disease. Thank you.

The CHAIRMAN. You were speaking about the dairy herds. What are the conditions as to introducing new stock into a herd?

Mr. KIERNAN. Into an accredited herd?

The CHAIRMAN. Yes.

Mr. KIERNAN. Before an animal can be introduced into an accredited herd it must have had two tuberculin tests, separated by a period of 60 days.

The CHAIRMAN. That is a part of the agreement?

Mr. KIERNAN. The owner signs an agreement to that effect; yes, sir.

Mr. RAINEY. You heard the discussion this morning between Mr. Brown of Chicago and Mr. Munn from St. Paul. There seems to be a conflict of understanding with reference to this appropriation. Mr. Brown suggested that in his estimation, inspection was paramount; that indemnity should be allowed, but if either one were to be curtailed, probably it would be preferable that indemnity be curtailed. The gentlemen from St. Paul suggested that the farmers might strenuously object to that.

Is your idea of the situation this: That the amount to be allowed by Congress should be given to the Department of Agriculture in a lump sum, and that they should pay for inspection whatever inspection is necessary, and that they should also apply the necessary amount to indemnity; and in applying the amount to indemnity that will necessarily lower the amount appropriated that they can use in salaries, but that the department should have discretionary powers, that it should be voted in a lump sum, and that it should be an elastic appropriation, and that you men who go about this particular thing should use it in that way?

Mr. KIERNAN. Yes; those are my views on the subject.

Mr. RAINEY. In that way you could provide for the inspection now, and at the same time take care of the indemnity also as it arises?

Mr. KIERNAN. Yes, sir. It seems only reasonable to me, if the State or the Government, after testing cattle, condemns them and takes them away from the owner for the welfare of the live-stock industry, that the State or the Government should reimburse the owner for the loss, or partially reimburse him, at least.

Mr. RAINEY. In the appropriation as it stands you are limited to a certain amount for indemnity, and a certain amount for inspection, and the amount allotted for inspection does not give the department opportunity to comply with the innumerable requests that have been made for inspection?

Mr. KIERNAN. That states the case.

Mr. RAINEY. The only way you can carry on your work effectively is to have a more elastic fund, so that you can send out the inspectors to discover this disease by inspection?

Mr. KIERNAN. That states it exactly, according to my view of it.

The CHAIRMAN. Thank you, Mr. Kiernan.

Mr. RAINEY. The last time I was here I made a plea for the veterinarians, to increase their stipend. Dr. Kiernan is a veterinarian, and I think he is wasting his time working for the Government. He ought to get outside where he can make more money.

Mr. SMITH. You mentioned a difference of opinion between Mr. Brown and Mr. Munn. Mr. Brown represents the various live-stock exchanges throughout the country, and he feels the great importance of stock-yard inspection to prevent the shipping out of these animals from the yards to the farms; but in his belief in that work he also believes just as heartily in the testing out on the farms. I know Mr. Brown very well, and I know that he feels greatly encouraged over the testing and accerding of herds in the country. I think both of them are equally important. It is absolutely true that the disease exists in the stockyards because it exists on the farms first. And so Mr. Munn is right in saying that we ought to give greater attention to this cleaning-up process on the farms, and that would decrease the disease in the stockyards.

Just one other point I want to make with regard to our production of live stock, and that is this: I mentioned this morning that we had now the highest prices on beef in the history of our country. Top prices for beef were 21 cents in Chicago yesterday. Those are the very highest prices, and that is due to scarcity. We have not a sufficient number of cattle in the country, and I fear that unless we can stimulate production we are going to see prices higher, to the detriment of the consumers. We have a shortage of cattle in this country. The range is no longer able to supply the demands of the feeders. The range has reached its limit. If we are going to have an increase of cattle throughout the United States, they must come largely from our farms, and if we are going to stimulate the production of cattle on our farms we ought to do everything we can to build up the industry on a healthy basis. We can not build up any industry on a diseased basis. So that this is right in line with our campaign for progressive production to eliminate this disease, which is a positive hindrance to development. I want to make that clear.

The CHAIRMAN. Have you any others to be heard, Doctor?

Mr. SMITH. I do not know of any others.

The CHAIRMAN. Mr. Hays, do you wish to be heard?

Mr. HAYS. Yes, sir.

STATEMENT OF MR. MARTIN HAYS, OF BOSTON, MASS., COUNSEL OF THE NEW ENGLAND FARMERS' AND LIVE STOCK DEALERS' ASSOCIATION (INC.).

The CHAIRMAN. Please state your name and residence.

Mr. HAYS. I am from Boston, Mass., and I represent the New England Farmers' and Live Stock Dealers' Association (Inc.). That is a Massachusetts incorporation, organized in 1918.

Mr. JONES. What position do you have in that association or organization?

Mr. HAYS. I am counsel for them.

Mr. JONES. It is an association of farmers and whom?

Mr. HAYS. Massachusetts farmers and live stock dealers. That association has a membership at the present time of about 150 farmers, cattle raisers and cattle dealers in all the New England States.

The market for cattle for those people is the Brighton stockyards at Boston, Mass.

Until July 1, 1919, the cattle at the Brighton stockyards were under State inspection. On that date the Federal Government took over the inspection.

I am addressing my remarks to this honorable committee in reference to tuberculin tests. These tests are made in accordance with regulations with which you are all familiar and I will not take up your time with the details unless you, Mr. Chairman, or any one of the other members of your committee desire to question me.

After a cow has been ordered killed by the Government inspector because of the fact that the chart after inoculation shows her to be a "reactor" there is always a post-mortem examination. If after such a post-mortem examination no lesion is found there is no way of showing that the animal was tubercular. Under the present conditions the owner of this animal has no redress. That is the grievance of my clients.

We find no fault if an animal is ordered killed and a post-mortem examination shows lesions, but it seems to us that a great hardship and wrong is inflicted upon us if through no fault or act of ours an animal is condemned and ordered killed because it is decreed tubercular and thereafter is found healthy and free from tuberculosis.

Since the Government inspection on July 1 last and to date about 150 milch cows were wrongfully killed, and I beg to present herewith a copy of a letter and inclosure from Dr. E. A. Crossman, inspector of the Bureau of Animal Industry at Boston, Mass.:

NOVEMBER 12, 1919.

MARTIN HAYS, Esq.,
18 Tremont Street, Boston, Mass.

DEAR SIR: AS per your request, please find inclosed list of cattle slaughtered and no lesions found covering the period from July 9, 1919, to October 30, 1919, inclusive.

Very truly, yours,

E. A. CROSSMAN,
Inspector in Charge.

Then follows a list of cattle slaughtered, with the names of the owners, which is as follows:

List of cattle slaughtered and no lesions found from July 9 to Oct. 30, 1919, inclusive.

W. A. Ricker.....	32	G. B. Farr.....	2
D. A. Walker.....	3	Putnam Bros.....	9
R. J. Blanchard.....	2	B. Crosby.....	3
F. L. Libby.....	11	C. H. Gage.....	6
W. C. Savage.....	1	Atwood.....	2
Burlingame.....	3	McSatyre.....	1
F. O. Thompson.....	1	Corey.....	3
Austin Brooks.....	7	J. A. Clark.....	2
F. L. Brown & Son.....	1	Levine.....	1
V. Hanson.....	2	Gleason.....	1
C. J. Hanson.....	1	Fogg.....	1
Dorand Bros.....	5		
D. Simon.....	1	Total.....	102
Harman.....	1		

The CHAIRMAN. How many are there, altogether?

Mr. HAYS. The total is 102.

Mr. McLAUGHLIN of Michigan. What is the percentage of the total?

Mr. HAYS. If my memory serves me, 318 were ordered killed, and 131 were found without lesions.

Mr. WILSON. Nearly 50 per cent?

Mr. HAYS. Nearly 50 per cent, Mr. Chairman.

Mr. WILSON. In this list there were 102?

Mr. HAYS. That is by Dr. Crossman's figures, from July 9 to October 30, 1919.

Mr. JONES. Your data are for the year?

Mr. HAYS. They only commence July 1. Previous to that we were under Massachusetts State inspection.

Mr. JONES. Within what period of time did the slaughter of 131 animals take place?

Mr. HAYS. From July 1 up to date.

Mr. McLAUGHLIN of Michigan. Those inspections must have been largely by State inspectors?

Mr. HAYS. They were entirely by Federal inspectors. The State inspection ceased on the 1st day of July and the Federal inspection commenced.

Mr. CANDLER. Do they not have State inspection?

Mr. HAYS. There are State inspectors there, but this is all under the supervision of the Federal inspectors.

Mr. CANDLER. Do the Federal inspectors report to the State inspectors? Do they work under them?

Mr. HAYS. No; they do not. The tuberculin testing in that yard I am informed is entirely by the Federal Government.

The CHAIRMAN. The men are employees of the Federal Government?

Mr. HAYS. Mr. Kiernan made an investigation of that.

Mr. KIERNAN. They are employed by the bureau and State.

Mr. WILSON. Is that the percentage that is usually found without lesions?

Dr. MOHLER. No. I think the Brighton tests show up the poorest of any for reasons which I will mention later. We have all the tests at the various stockyards here and many of them will show as satisfactory as tests on farms.

Mr. HAYS. Permit me to illustrate how that affects my clients. I quote from a letter addressed to me by Mr. William A. Ricker, a cattle dealer from St. Johnsbury, Vt., dated November 17, 1919:

Cow No. 41788. My No. 3416 proved to be all right; no lesions at all. Now, I had this cow sold to Mr. Coburn for \$125 and I realized from same for beef purposes only \$32. Now, here is a loss to me of \$93.

The loss in these cases will probably average \$100 per animal, and inasmuch as the people whom I represent are to a large extent small cattle dealers it has resulted in some instances in such great hardship that the profits of an entire year were lost and in one or two cases has put the cattle raiser and shipper out of business.

The laws of Massachusetts provide for reimbursement in instances such as I have cited and until July 1, 1919, the Commonwealth of Massachusetts reimbursed the owner in all instances where no lesions

were found after an animal had been ordered killed after tuberculin tests and no lesions had been found.

We earnestly desire your favorable consideration for an appropriation so that the United States Department of Agriculture will have the right to pay the difference between what the carcass brings for beef, plus the value of the hide and the value of the animal before slaughter.

I have been in conference with Dr. J. R. Mohler, Chief of the Bureau of Animal Industry at Washington, D. C., with Dr. E. A. Crossman, in charge of the Bureau of Animal Industry at Boston, Mass., and with other veterinarians connected with the department and they are unanimously of the opinion that such legislation as I am asking for should be favorably acted upon. Inasmuch as there is no opposition to the proposed legislation and necessary appropriation and as I can conceive of none from any source, I am not going to burden your honorable committee with any extended remarks.

If the principle involved appeals to your sense of fairness and justice, I believe you should make the taking effect of the legislation retroactive to July 1, 1919, so that those persons who have suffered because of the conditions which I have described, through no fault of their own, may be reimbursed, subject to the approval of the Department of Animal Industry. Having presented a situation which admittedly requires alleviation, I leave the cause of the people whom I represent to your consideration and I earnestly urge speedy action.

I might supplement this, if I may be permitted, Mr. Chairman, by stating that our situation is not analogous to that of the gentleman who preceded in the other hearing. When an animal is condemned, and there are lesions found, the people that I represent ask for nothing from the Government, and are perfectly willing to have the animal slaughtered and to pocket their loss.

It is only when an animal has been slaughtered under the direction and by order of the Government, and the Government can not prove its case—in other words where no lesion is found in the animal, and it is therefore presumably healthy—that I ask that the men I represent be not burdened with a loss which they did not contribute to in any way.

Mr. McLAUGHLIN of Michigan. What is the proceeding in a case like you speak of there? The writer of this letter had a cow which he said that he had sold for \$125 before it was killed.

Mr. HAYS. For \$125.

Mr. McLAUGHLIN of Michigan. But when the butcher handled it, it was worth only \$35.

Mr. HAYS. Only \$32, in this case. They run from \$30 to \$50.

Mr. McLAUGHLIN of Michigan. There was an appraisalment of the value of the cow before she was slaughtered, was there not?

Mr. HAYS. Not necessarily. He brought the cow there for sale, and sold the cow for \$125. These are dairy cows, you know.

The CHAIRMAN. He sold the cow subject to test?

Mr. HAYS. No; I do not think so. The cow was sold subject to the test, of course. There is no liability to produce the cow.

Mr. JONES. If he sold it, he could have got his money under the sale.

Mr. McLAUGHLIN of Michigan. I understand that where the Bureau of Animal Industry, cooperating with the State authorities, slaughters an animal, there is an estimate made of its value for breeding purposes or for beef, so that there must have been an estimate of the value of this cow before she was killed.

Mr. HAYS. You mean an estimate by the Federal authorities?

Mr. McLAUGHLIN of Michigan. Yes.

Mr. HAYS. None that I know of.

Mr. McLAUGHLIN of Michigan. I supposed that was the proceeding.

Mr. JONES. That would not make any difference if he had sold the cow for \$125. Whatever estimate they made on it, he would not be bound by their estimate, but the Government would have to pay for it on the accredited value.

Dr. MOHLER. This was an interstate movement through a public stockyard. The Government under present regulations does not pay for animals that react except where the whole herd is under supervision and the owner is cooperating to get a clean herd.

Mr. McLAUGHLIN of Michigan. Was not this done under this appropriation?

Mr. HAYS. Not under the accredited herd provision. It was done under the interstate movement of live stock.

Mr. McLAUGHLIN of Michigan. Under the authority under which you are acting, have you the right to compel the killing of the animal?

Dr. MOHLER. No; but we have a right to prevent its shipment, interstate, from the public stockyards, and it could not get out of the stockyards, to move intrastate, without the consent of the State officials, if it reacted to the tuberculin test. Let me explain that this is not connected with our accredited herd work. The cow in question came from Vermont into Massachusetts, and for the convenience of the owners, we have permitted cattle from other States to go into the Brighton Stockyard, at Boston, where they are held for the tuberculin test. This was a dairy cow, coming from another State into Massachusetts, and she evidently reacted to the tuberculin test, but on the post-mortem no visible lesions were found.

Mr. McLAUGHLIN of Michigan. Acting under that law, can you compel the creature to be killed?

Dr. MOHLER. No; but as a rule they are killed, although they could be quarantined.

Mr. McLAUGHLIN of Michigan. Whether the owner wishes it or not?

Dr. MOHLER. They are either killed or quarantined. They can not be moved interstate, under the organic act of 1884.

Mr. JONES. Any you pay no indemnity on these animals?

Dr. MOHLER. No. This is not a question alone of getting rid of tuberculosis, it is a question of protecting the buyer from purchasing diseased cattle in interstate trade.

Mr. JONES. That is not done under this act?

Dr. MOHLER. It is not done under the project for the tuberculosis-free accredited herd work.

Mr. McLAUGHLIN of Michigan. What course would you have taken if you had quarantined that animal?

Dr. MOHLER. We would have called in the State, and the State officials would have disposed of it according to the State regulations. We had no control of the animal except as an interstate product.

Mr. McLAUGHLIN of Michigan. You can forbid the shipment from one State to another?

Dr. MOHLER. Yes.

Mr. JONES. Then I understand that under your interstate provisions the Government has the right to take an individual cow and slaughter it, without paying any damage to the owner of any kind?

Dr. MOHLER. No; the Government does not order the slaughter, but if the cow is killed there has been no provision made for indemnifying the owner of an animal shipped in interstate commerce.

The CHAIRMAN. You did not order the killing of that cow?

Dr. MOHLER. No. We have no authority to order reacting animals killed.

Mr. McLAUGHLIN of Michigan. But the cow was killed under your direction?

Dr. MOHLER. As the result of the cooperative test with State inspectors.

Mr. McLAUGHLIN of Michigan. But you did not order her killed?

Dr. MOHLER. No, sir.

Mr. McLAUGHLIN of Michigan. And were not responsible for the killing?

Dr. MOHLER. No, sir.

Mr. McLAUGHLIN of Michigan. And the Federal Government did not pay anything toward it?

Dr. MOHLER. No. That is what the gentleman is referring to.

Mr. McLAUGHLIN of Michigan. But what is the effect, if you say a cow can not go any further?

Mr. LEE. It is to quarantine.

Mr. McLAUGHLIN of Michigan. But if it can not leave the quarantine for any other purpose, that compels it to be killed?

The CHAIRMAN. Under the law it has to be returned to the State from which it came?

Dr. MOHLER. If pure bred it could be returned to the State of origin, under the regulations. We can not compel it to be slaughtered.

Mr. McLAUGHLIN of Michigan. So that the owner of that cow could have taken that cow back where she came from and put her in quarantine, or she could have been killed?

Mr. HAYS. I suppose possibly he might, but it seems to me, in listening to the arguments this morning, it would be diametrically opposite to what this committee would desire, if a cow is tubercular that it should be returned to the place of origin and be allowed to be at large there.

Mr. McLAUGHLIN of Michigan. They were operating under a law that we were not considering this morning.

Mr. HAYS. Yes; of course; but the contagion that might arise from that cow would be the same in the case of a small dealer that has only half a dozen cows as in the case of a larger one. The people that ship their cattle to Brighton have anywhere from one animal up, and it is a public stockyard and they send their cattle there for sale.

Mr. McLAUGHLIN of Michigan. You speak of being a small dealer. I think it would be pretty small if the cow was worth only \$35.

Mr. HAYS. That is all she brought. She was worth \$125. She was sold for that.

Mr. McLAUGHLIN of Michigan. She was worth \$125 as a dairy cow, but only \$32 as meat?

Mr. HAYS. Yes, sir.

Mr. JONES. I would like to get this thing cleared up. Do you understand that when that cow was quarantined by the Federal Government the owner of the cow had a right to take the cow back home?

Mr. HAYS. I did not know that. As a matter of practice—

Mr. JONES. As a matter of fact, he authorized the killing of the cow? The owner acquiesced in it? Was there anything else for him to do?

Mr. HAYS. I will ask Mr. Ricker to answer that.

Mr. RICKER. The man there under Dr. Mohler's charge ordered these cattle killed, and I had no redress from it.

Mr. JONES. Who ordered them killed?

Mr. RICKER. The Federal bureau.

Dr. MOHLER. Did they serve you with a notice, or how did they order them killed?

Mr. RICKER. I do not know. They ordered them killed.

Dr. MOHLER. Our inspectors did not kill them, of course.

Mr. RICKER. They take them to the slaughterhouse and they are killed.

Mr. HAYS. I know they ordered them killed; and, as I undersand, they were killed, and we got no compensation.

Mr. McLAUGHLIN of Michigan. The Government officials are usually very competent and very careful, but sometimes they make mistakes, and if we had to make good all the mistakes that officials of the Federal Government make, it would take a good deal of money.

Mr. HAYS. Mr. Chairman, I might say, in answer to that, that if I understand the feeling in the department, which I have gathered from conversations with various veterinarians, they would rather kill 10 healthy cows than to let one unhealthy one escape; so that if there is any doubt, if there is any temperature shown, whatsoever, on the test, they order the cow killed; and while it might be a hardship in some instances for the Government to pay for the mistakes of all its agents, nevertheless in the law, as the Congressmen well know, it is the theory, and it is a greater hardship on an individual to stand it, it seems to me, than for the Government to do so.

Mr. McLAUGHLIN of Michigan. Let me give you a case showing an instance of the way the Government deals with some of its people. There was a lady in my congressional district who was informed, upon inquiry, that certain land was open to homestead entry, and she took up 80 acres of land under a homestead entry. She made a proper filing and went into possession and improved that property to the extent of \$2,500. Later she found that another patent had been issued previously to hers, and the land was taken away from her by the owner who had the previous title. She put the matter up to the Land Office here, and the Land Office said, "Why, the Government does not issue quit claims, and we can not do anything for you."

Mr. HAYS. Mr. Chairman, I do not think that is analogous.

Mr. McLAUGHLIN of Michigan. I do not think so, either. I think it is highway robbery.

Mr. HAYS. She should have examined the title.

Mr. McLAUGHLIN of Michigan. Oh, pardon me, she did. She asked the official representatives to tell her from the State records, and they told her that the land was open to homestead entry. How could she know?

Mr. HAYS. I should also imagine, Mr. Chairman—not wanting to deviate from the subject—that she has so able a Representative in Congress that she will probably be reimbursed. [Laughter.]

Mr. JONES. He might take this cow case for you.

Mr. McLAUGHLIN of Michigan. Who represents the congressional district where this loss was suffered?

Mr. HAYS. Those animals come from several States. We have not any direct Representative on this committee. There are no New England men on this committee.

Dr. MOHLER. May I say something with reference to this point brought up by Mr. Hays? As you all know, it is against the statute for diseased cattle to be shipped in interstate commerce, and one of our regulations requires a tuberculin test for dairy cattle moving interstate. As an exception to that rule of not permitting cattle to move into any other State without examination, and for the convenience of the owners, we are allowing these cattle to be shipped to the Brighton stockyards and examined there. I think we have records of 322 reacting animals killed, which were shipped to the Brighton stockyards, 217 of which were visibly tuberculous, and the difference between 322 and 217, or 105, showing no visible lesions. That is an accuracy of about 68 per cent, so that it is slightly more than the figures given by Mr. Hays. But the point is that we are doing this as a convenience to the owners of the cattle, and it was not proper for the man who was doing this buying to ship 217 diseased cattle into Massachusetts.

The whole problem can be solved by Mr. Ricker, as I have told him, by having the cattle tested in Vermont, and if they are diseased held in Vermont and not brought into Massachusetts in interstate traffic. That is what I think is largely being done now.

Mr. McLAUGHLIN of Michigan. If those cattle had been examined in the State of Vermont, a certificate would have been issued there?

Dr. MOHLER. Yes; and they could have come into Massachusetts under that certificate.

Mr. McLAUGHLIN of Michigan. And would that have been accepted by you?

Dr. MOHLER. Yes; and by Massachusetts also. That is what is being done. There are more animals being tested to-day in Vermont and New Hampshire and Maine for shipment to the Brighton stockyards than ever before. Before the 1st of July the cattle that came to the Brighton stockyards, as Mr. Hays has stated, were tested by the Massachusetts officials. They did not take them all on one test, but if they reacted they held the reactors over for another test, and the result was that they were sometimes able on the second test to pass animals. A number of those that reacted the first time were considered clean the second time. But they were not all considered clean. There were still those that would react to the second test.

Mr. McLAUGHLIN of Michigan. When those animals are tested in Vermont before being shipped out, by whom are they tested?

Dr. MOHLER. By anyone considered satisfactory by Commissioner Brigham, of Vermont, and approved by us.

Mr. McLAUGHLIN of Michigan. You do not require them to be inspected by a member of your bureau?

Dr. MOHLER. No. That is done by these 6,000 or 7,000 veterinarians who are approved by the bureau. We do not claim that the tuberculin test is infallible, although we find that it works satisfactorily on animals on farms in 95 per cent of the cases. These Brighton stockyard animals are dairy cows, and they are bagged up and fed high and brought on there in a strange environment to be sold. The chairman knows how very hard it is on the system of a dairy cow to be bagged up and fed high in order to make a good showing on sales day, as everything is against the tuberculin test when applied to cattle under those conditions.

Mr. McLAUGHLIN of Michigan. When they get to the post-mortem examination and there is no lesion found, is that considered conclusive of the fact that there is no tuberculosis?

Dr. MOHLER. No, sir; it is not.

Mr. McLAUGHLIN of Michigan. A cow may be infected with tuberculosis although no lesions are found?

Dr. MOHLER. That is often the case. As I said, we have had a number of glands from no-lesion reactors sent to our laboratory in Washington for microscopic examination and the last figures I had show tuberculosis in about 50 per cent of the glands sent in from these no-lesion cattle that are killed, while the other 50 per cent are normal.

The CHAIRMAN. What was the remedy for the owner in this case? The cow could have been shipped back to Vermont?

Dr. MOHLER. Yes; if it was a pure-bred cow. Pure-bred cattle can be returned to the State of origin, but no other kind can be so returned. That was allowed by our regulations two years ago. I understand that this was a Holstein cow.

The CHAIRMAN. Under the the rules and regulations it could have been shipped back?

Dr. MOHLER. Yes.

The CHAIRMAN. The law permits it?

Dr. MOHLER. Yes, sir.

Mr. HAYS. My people would be satisfied with a reasonable test, and it seems to me that if the Government can not show, either by an examination of the glands, if the Government thinks that is necessary, or by the ordinary test that is applied and finding of lesions, and if the agent has made a mistake and there is no tuberculosis in the carcass, then the owner should not be asked to bear the burden, particularly as under our State inspection he was not asked to do so. There was no difficulty about it under the State inspection. The Commonwealth paid the bill. If they found that they had killed a cow and there was no lesion, the Commonwealth paid for it, and that was the end of it. Those were the conditions up until the 1st day of July; and I trust you gentlemen will take into consideration that while there were 171 or 270 animals killed, they did not come from one or two or three or four or five shippers, they came from

a large number of small shippers; and that you should not penalize one unlucky fellow because there may have been a bad actor in some section of New England.

That is the situation here to-day. We are here with a wrong, without any remedy, unless you gentlemen give it to us.

The CHAIRMAN. Would the 50-50 plan be satisfactory to your State, and would your State put up an equal amount?

Mr. HAYS. I think not, as long as it is under Federal inspection. I have talked with Dr. Howard, who was the head of our board of animal industry, and he did not favor it at the time. What our legislature would do I am not prepared to say.

The CHAIRMAN. The department has no discretion?

Mr. HAYS. Not if we pass an act.

The CHAIRMAN. On the 50-50 plan?

Mr. HAYS. Not if we pass an act. But whether they would want to do that when the inspection is Federal and the mistake is Federal, I am not prepared to say. I do not really see why the Commonwealth should pay for a mistake of the Federal Government. It would be different if we paid for every animal that showed tuberculous tendencies—that would be one proposition—in order to eradicate the disease, and if the owner of the animal was satisfied with that. But we are in a different position. Whenever the animal is tuberculous we are perfectly satisfied to have it killed for our mistake. It is only when the animal is not tuberculous that we appeal to you.

The CHAIRMAN. There seems to be some question as to who is responsible for the condemnation, whether the cow is condemned by the department or by the State, or voluntarily by the owner.

Mr. HAYS. As I understand it, Mr. Chairman, the test is made by the Government.

The CHAIRMAN. Yes.

Mr. HAYS. And the Government inspector condemns the cow to death, and it is killed without much loss of time. That is the practical working out of it.

The CHAIRMAN. I understood the doctor to say that the test was made there as a matter of convenience to the owners.

Mr. HAYS. No; it is a matter of necessity. The matter of convenience is that it is at the stockyards, and that convenience works just as much for the benefit of the bureau as it does for that of the shipper and dealer. Here is one central point where a large number of the cattle of New England are sent, and it is much more convenient for the Government than to have its men travel all over New England testing these cattle.

Dr. MOHLER. We would not attempt to do that, of course.

Mr. HAYS. You could not attempt that. We have had an experience in having our animals tested before shipment. I might state an unfortunate case that happened, where they were cited for re-testing, and when I made complaint and said that this man who examined the cattle was approved by the Federal department, and asked them why they retested them, they said, "Oh, he did some things we did not like, and we had to retest." In other words, the department has not got that confidence in all veterinary agents that it might have; and we have no way of knowing whether the veterinarian who would test our cattle in the States stands in the good graces of the department or otherwise.

Mr. HUTCHINSON. These cattle were brought from Vermont to be slaughtered in Boston?

Mr. HAYS. No; for dairy purposes.

Mr. HUTCHINSON. Not to be slaughtered?

Mr. HAYS. No; they are brought in from New Hampshire and Vermont and a few from Maine, into Massachusetts. Some of them are sent to the other New England States, and some are sold to Rhode Island and some to Connecticut, and some stay in Massachusetts.

Mr. JONES. And some might be sold back to Vermont?

Mr. HAYS. Yes; some might be sold back to Vermont. Brighton is a suburb of Boston. That is the great market in that part of the country.

Mr. HUTCHINSON. There are none of those cattle that come in there without a certificate, are there?

Mr. HAYS. No; they have the option of being tested in Brighton.

Mr. HUTCHINSON. Who gives them the option of being tested in Brighton?

Mr. HAYS. The department, as I understand.

Mr. HUTCHINSON. Suppose they stopped that; would not that remedy the case?

Dr. MOHLER. Yes, sir.

Mr. HUTCHINSON. That is what they ought to do.

Dr. MOHLER. The Secretary's regulations allow these cattle from one State to go into a public stockyard in another State and be tested there, purely for the convenience of the shippers and not for the sake of the department at all, because it would be less work for us to have tests made in Vermont through State men and have the animals shipped into Massachusetts with the Vermont test charts.

Our man at Brighton, instead of taking 36 hours to make a test, could see if the test chart was all right, and then O. K. it in five minutes.

Mr. HUTCHINSON. That is what you should do.

Dr. MOHLER. Yes; I think Mr. Ricker has been doing that for the past few months.

Mr. HAYS. I would say, on that, that at many points in the States no veterinarian is accessible, and an examination there would entail a large expense. It might cost \$25 if a man had one or two cows that he wanted tested, and it would be unreasonable; and they would not know to a certainty that that test would be satisfactory to the department. The owner would not know but what that particular agent had gotten in bad with the department and that his test would not be satisfactory.

Dr. MOHLER. He is not the agent of the Government; he may be the agent of the State.

Mr. HAYS. He becomes an agent when he is approved. The word "agent" is used in this broader sense. A veterinarian may outwardly, at least, have the approval of the department, but when these papers get to Brighton the dealer is likely to find out that the papers have no value in the eyes of the department.

The CHAIRMAN. You have no authority to appraise animals except on the farm?

Dr. MOHLER. Not under the present law; no, sir.

Mr. HAYS. I would like to call on Mr. Ricker to make a statement. The CHAIRMAN. The only remedy in this case is to ship the cattle back to the States?

Dr. MOHLER. The owner can do that, of course, only in case the cattle are pure-bred animals.

The CHAIRMAN. That preference given to pure-bred animals is through a regulation of the department?

Dr. MOHLER. In the law of 1917, I think, you will find that it states only pure-bred animals could be returned. That, I think, was in the original act for accredited herd work.

The CHAIRMAN. It states that the Secretary of Agriculture may in his discretion, under such rules and regulations as he may prescribe, permit cattle which have been shipped for breeding, and so on. There is nothing about pure-bred cattle there.

Dr. MOHLER. Then it is a regulation, which prescribes pure-bred cattle. I thought it was in the law.

Mr. HAYS. No. May I not ask, would not that defeat the object of this honorable committee in regard to the eradication of tuberculosis, if, assuming that an animal is tuberculous, it should be allowed to be shipped back?

The CHAIRMAN. That was put in the law in order to make it certain that they were not to reimburse the packers, but would reimburse the farmers. The packers definitely make an allowance, or such reductions necessary to make good the losses through tuberculosis. We thought it would be too big a proposition to reimburse the packers, and I think all who appeared before the committee agreed with us.

Mr. HAYS. That does not deal directly or indirectly with the farmers. It is only the small dealers in New England who are interested and concerned in this, and I would like to have you hear from Mr. Ricker.

Mr. CANDLER. I do not understand about the functions exercised by your State authorities. Since the 1st of July they have had no authority at all?

Mr. HAYS. So far as tuberculosis is concerned, no. That is entirely Federal.

Mr. CANDLER. They have gone out of business so far as that feature of it is concerned?

Mr. HAYS. So far as State inspection is concerned. The State does not function. The Federal Government has taken it all.

Mr. CANDLER. That is relating to these interstate shipments?

Mr. HAYS. Yes.

Mr. CANDLER. So far as the State is concerned, the State authorities still exercise authority over that business?

Mr. HAYS. Yes.

Mr. CANDLER. This is merely in respect to interstate shipments coming into the State that the Federal Government has control?

Mr. HAYS. Yes; there is no tuberculin test, as I understand it, of State cattle. In other words, if a man from Massachusetts brings his animals into the Brighton yards, there is no test.

Mr. CANDLER. As I understand, and I am a little surprised to learn that, there is no cooperation between the Federal Government authorities and your State authorities.

Mr. HAYS. So far as I know, there is not.

Mr. JACOWAY. Ever since I have been on this committee they have been making vast appropriations for this work. What progress have you made in the last five years in stamping out or eradicating tuberculosis among cattle?

Mr. HAYS. I do not think that I can answer that question. I do not know. I found out this morning when I asked, when Dr. Mohler was reading the list of appropriations, that Massachusetts appropriated last year \$53,000. The progress that has been made I am not conversant with.

Mr. JACOWAY. You have some superficial idea of it, have you not?

Mr. JONES. Mr. Hays is an attorney, Mr. Jacoway, representing an association here. He appears only in that capacity. I do not think he is qualified to answer that question.

Mr. JACOWAY. All right; I just wanted to see what was being accomplished.

Mr. HAYS. There are some other questions to be answered, and I would like to call on Mr. Ricker, who is president of the association and is a cattle dealer and cattle raiser.

The CHAIRMAN. Thank you, Mr. Hays. We will hear Mr. Ricker.

STATEMENT OF MR. W. A. RICKER, ST. JOHNSBURY, VT., PRESIDENT OF THE NEW ENGLAND FARMERS' AND LIVE STOCK DEALERS' ASSOCIATION (INC.).

Mr. RICKER. I want to correct Mr. Hays in the name that he gave the association, if you will pardon me. It is the New England Live Stock Dealers' and Farmers' Association. You gave it, Mr. Hays, as the "Massachusetts" association. It represents all of the shippers of the New England States shipping into what we call our Brighton market, there, which is the same for that part of the country as the Chicago market is in the West.

I do not know whether you want us to tell the story, or whether you want to ask me questions here. I will do either one you want. We have a veterinarian to go and represent us after these cattle are condemned by the bureau, and he gave me some figures here. He examined these cattle that the Bureau of Animal Industry killed since the 1st day of July, since the Bureau of Animal Industry took the testing of the cattle away from the State of Massachusetts, and his figures show that 318 cattle were destroyed and 131 proved to have no lesions.

Now, all that we are asking for is to get an appropriation here some way, or to get a bill through, so that we can be reimbursed for these mistakes. We think it is a hardship on us. I have got the names of the owners of these cattle and the number of head that were killed at different times, and belonging to different shippers, and the numbers that were condemned.

Take myself. I shipped 105 which were killed cattle during this time, and 43 proved to have no lesions. As he says here is a personal letter to me, some of those they have sent to be examined in the laboratory in Washington, and he has had no report ever made to him on that.

Mr. WILSON. Were the 105 cattle you speak of those that were killed?

Mr. RICKER. One hundred and five were killed, and 43 proved to have no lesions.

Mr. WILSON. These cattle were your own personal property?

Mr. RICKER. My personal property. I have about 75 men buying stock for me throughout Vermont and New Hampshire, and shipping to Brighton anywhere from 110 to 125 milch cows to the Brighton market. It is almost impossible to get them tested in the country before shipment. We realize that we have been allowed to ship them into this quarantine station, and that is a great help, but we think we are being put upon pretty hard when you take 43 out of 105 that are sound animals; nothing can be shown against them on examination without a microscope or anything else.

Mr. JONES. What is your understanding of what you can do when you are notified that these cows are in quarantine?

Mr. RICKER. They are condemned and the Bureau of Animal Industry orders them slaughtered.

Mr. JONES. Are you given any notice that they are subject to the quarantine?

Mr. RICKER. They are subject to quarantine the minute they arrive there. We can not do anything else with them.

Mr. JONES. Are you given notice that they are killed?

Mr. RICKER. We are right there on the ground and see the operation. They put chains around the necks of the animals and if they are free from tuberculosis the chain is removed. Then if they want to hold them for another week for a retest, they put another chain on them.

Mr. JONES. Have you any remedy in the matter, or do you know of any?

Mr. RICKER. I do not see that I have any, sir.

The CHAIRMAN. Who condemns the cattle?

Mr. RICKER. The Bureau of Animal Industry.

The CHAIRMAN. There seems to be some question about it. I understood Dr. Mohler to say that they did not condemn them.

Dr. MOHLER. They are condemned by the tuberculin test, as reacting to the test for tuberculosis.

Mr. McLAUGHLIN of Michigan. By your men?

Dr. MOHLER. Sometimes by our men and sometimes by the State men who are always there. In fact, the testing is done cooperatively, the State having the same number of men as the bureau. A cow may have one temperature taken by a bureau man and the next by a State man or vice versa.

The CHAIRMAN. They are declared to be tuberculous, but you do not order them killed, do you?

Dr. MOHLER. No, sir; we do not order them killed.

The CHAIRMAN. Who orders them killed?

Dr. MOHLER. Mr. Ricker knows more about that.

Mr. RICKER. I know of no one else but your man that orders them slaughtered.

Dr. MOHLER. But they are shipped there subject to test, and the understanding is that, if they are tuberculous, they can not go any farther, and they are then subject to State regulation.

Dr. MOHLER. The man that injects the tuberculin is not the man who does the post-mortem work.

Mr. RICKER. But the man that inspects them tells them to kill them.

Mr. JONES. Who tells them to kill them?

Dr. MOHLER. I do not know, I am sure.

Mr. JONES. What do you know about that, Mr. Ricker?

Mr. RICKER. All I know is that some one of those men takes these cattle, and they are driven down to the cattle house and killed.

Mr. HAYS. Is that a State man or a Department of Agriculture man?

Mr. RICKER. I do not know.

Mr. HAYS. Who orders them killed?

Mr. RICKER. I do not know. I am not in touch with that.

Dr. MOHLER. The man in charge of the Federal work at Brighton stockyards is Dr. Crossman, while the State work there is in charge of Dr. Howard, who has three representatives present all the time. Dr. Howard is the chief of the department of animal industry of Massachusetts, and he and Dr. Crossman cooperate in the friendliest way, each in accordance with his authority.

Mr. RICKER. Dr. White?

Dr. MOHLER. Yes; he is there, representing the State of Massachusetts.

Mr. WILSON. Who makes the post-mortem examination?

Dr. MOHLER. If the animal goes to a Federal-inspected establishment, the inspector of the Federal meat-inspection service makes it.

Mr. WILSON. I am talking about these cows, now.

Dr. MOHLER. I have not specific data on these cows.

Mr. WILSON. Where do they go; to the packing house?

Dr. MOHLER. To the packing house, or a slaughterhouse of some kind, that is under Government inspection.

The CHAIRMAN. Do you know who makes the post-mortem examination?

Dr. MOHLER. If it is done in a Federal plant, the Federal Government makes it, but I can not give you the name of the man.

Mr. RICKER. I think it is Dr. White.

Dr. MOHLER. I do not know. The only Dr. White I know of in Boston represents the State of Massachusetts at the Brighton yards. I always supposed that it was a State man that permitted these cattle to be killed instead of holding them under State quarantine.

The CHAIRMAN. Is it not a fact that the law of the State requires the killing of these cattle?

Mr. RICKER. I can not answer that.

Mr. HAYS. So far as I know. Are you certain that the State representative has not been there for the purpose of detecting anything in connection with tuberculosis? I am informed by Dr. Ellsworth here, who will testify in a few moments, that the killing is ordered by the Federal agent, and that the post-mortem is made by the Federal agent.

The CHAIRMAN. Thank you, Mr. Ricker.

Mr. JONES. If there is somebody here who has the facts let him testify. Let us get through with this.

The CHAIRMAN. We will hear Mr. Ellsworth.

STATEMENT OF MR. JOSEPH W. ELLSWORTH.

Mr. ELLSWORTH. I do know that the Federal authorities have charge at the Brighton yards and work through the State authorities, and what is done there is this: The cattle are ordered to be killed by the Federal authorities, and are driven to the abattoir and killed. The cattle that go down to the abattoir are driven there by the Federal authorities.

Mr. JONES. May I ask what happened to Mr. Ricker's cattle that reacted to the tuberculin test, in general, before the Federal Government took charge there?

Mr. ELLSWORTH. The State took charge of them.

Mr. JONES. And the State killed them?

Mr. ELLSWORTH. Yes.

Mr. JONES. And the State paid for them?

Mr. ELLSWORTH. They paid for those that did not show lesions after being killed.

Dr. MOHLER. As I understand, this same class of cattle have always gone to the abattoir?

Mr. RICKER. Yes.

Dr. MOHLER. The State ordered them killed before the 1st of July?

Mr. ELLSWORTH. Yes.

Mr. JONES. You do not mean to say that the State would order them killed now?

Mr. ELLSWORTH. I do not think so.

Mr. JONES. If the State ordered them killed and paid for them before the 1st of July, you do not imagine that the State would order them killed now and wipe out the indemnity, do you?

Dr. MOHLER. I do not know.

Mr. JONES. You do not imagine they would do that, do you?

Dr. MOHLER. I do not know; but whoever ordered them killed before July 1 has, in my opinion, ordered them killed since July 1, and I feel certain no Federal inspector has overstepped his authority to that extent.

The CHAIRMAN. Have you any authority to order them killed?

Dr. MOHLER. No, sir; we have not.

Mr. ELLSWORTH. I know that on the 1st of July the State authorities stepped down and the Federal authorities stepped in, and they have been getting cattle just as before.

Dr. MOHLER. Since the Federal authorities became associated with this work on the 1st of July the owners have not been paid for no-lesion reactors by the State. Whoever ordered them killed before probably did not have to order them since that time, because the procedure had become routine, and most dealers prefer slaughter to quarantine in these cases.

Mr. ELLSWORTH. Only that the Federal authorities ordered them killed.

Mr. CANDLER. If they were killed under the State law before the 1st of July, then after the Federal authorities took control, I take it, they were killed on whatever the Federal authorities found. Or were they killed under the State law, which does not permit them to remain in the State?

Mr. ELLSWORTH. Before the 1st of July the State authorities took charge of these cattle and had them killed.

The CHAIRMAN. Thank you, Mr. Ellsworth.

Mr. CANDLER. If, prior to July 1, they were killed under the State law, then the State must evidently take the examination of the Federal Government as to the existence of the disease, and the penalty is inflicted by the State.

Mr. JONES. Their argument is that the State repealed the prior law as to indemnity, but still continued to exercise the right to kill these cattle. I think that is unreasonable, and I do not think that any State would do such a thing.

Dr. MOHLER. The only feature I know of that might have a bearing on this point is the fact that the Massachusetts State law is very stringent in regard to the bringing into the State of diseased cattle, and they would not allow cattle purchased in Massachusetts, and subsequently found tuberculous on the 60-day retest in another State, to be returned to Massachusetts, even though the Federal Government might permit it. The Massachusetts State law prohibits any tuberculous cattle coming into Massachusetts.

Mr. JONES. If there is a State law of Massachusetts which provides that where cattle do not have tuberculosis the owner should be reimbursed for the full value of the cattle—if there were such a law I do not know and I do not say that there was such a law. If they repealed that law as to the indemnity and still kept the right to kill the cattle, do you not imagine that that would create such an uproar in the State that everybody would know about it?

Dr. MOHLER. Yes; but your premise is wrong. There has been no law repealed. This is an act of the chief of the department of animal industry in Boston, and his view, as he explained it to me, was this: That he was going to stop the shipment in there of diseased cattle from other States, and that he did not propose for Massachusetts to be a dumping ground for diseased cattle and then have the taxpayers of Massachusetts reimburse the breeders of other States.

Mr. JONES. You mean there was no law of Massachusetts whereby the State paid for the cattle killed at Brighton?

Dr. MOHLER. There has been no repeal of such a law.

Mr. JONES. Was there such a law?

Dr. MOHLER. I do not know whether there was such a law or not. I know that since the 1st of July the chief of the Massachusetts department of animal industry decided that he would not pay.

Mr. JONES. Under what authority does the State pay money if there is no law to pay it?

Dr. MOHLER. I did not say that there was no law, but there has been no repeal of such a law.

Mr. JONES. Was there a law?

Dr. MOHLER. I do not know; but I repeat there was no repeal of a law.

Mr. JONES. Then the law is still in force?

Dr. MOHLER. I am not arguing—

Mr. JONES. If there was such a law and it has not been repealed, it is still in force?

Dr. MOHLER. Certainly.

Mr. JONES. Then why does not the State reimburse these fellows who bring their cattle into the State, which are killed under these circumstances?

Dr. MOHLER. I shall endeavor to find out for you.

Mr. JONES. Massachusetts is not liable, or they would pay it; is not that true?

Dr. MOHLER. I should think so.

Mr. JONES. Yes.

Mr. HAYS. So far as the law is concerned, if I may clarify it a little, I am not familiar with all the statutes there, but I am and have been for the last 15 years a member of the State legislature, and I know there has been no law repealed. The legislature was in session until the 26th of last July, and is in session at the present time. We have a law that provides for the reimbursement for cattle such as I have described, when there are no lesions, and appropriation has been made annually for that purpose. There has been no repeal of a law.

Mr. JONES. Why did the State refuse to pay?

Mr. HAYS. Because we did not order the animals killed. That is the whole answer. The animals are ordered killed by the Federal authorities.

The CHAIRMAN. Are they not ordered killed by virtue of law?

Mr. HAYS. Massachusetts law?

The CHAIRMAN. Yes.

Mr. HAYS. I know of no law which would compel the killing of a cow that is affected by tuberculosis.

Mr. WILSON. I notice that a little over 40 per cent of the cattle that have been killed, as Mr. Ricker says, did not have any disease. What was the percentage of the cattle killed and found to be all right under the prior supervision by the State?

Mr. HAYS. I have not the figures, but I think that what Dr. Mohler says is correct. Under State supervision, if I am correctly informed, a large number of the reactors were held for a retest, and again, if I am correctly informed, very frequently when a cow is subjected to a retest within a week or two weeks after the first test, if she does not react within a certain time, she is turned loose in the community; so that I should say that the percentage of killing was less; how much less I do not know, but that it was considerably less.

Mr. WILSON. This looks to me like a pretty big percentage of mistakes to make; does it not to you, Doctor?

Dr. MOHLER. That is a larger percentage than we have in other places. We have a number of stockyards where the accuracy is 100 per cent; but I think that we can explain why the errors are more frequent at Brighton. The cattle there are mostly milk cows, and they are bagged up and fed high for a sales day. They are fixed up and put in fine condition so that they will bring good prices on sales day.

The CHAIRMAN. Are these cattle sold at auction?

Mr. RICKER. No, sir; at private sale.

Mr. CANDLER. Was this appropriation, made by the State, to pay for Massachusetts cattle?

Mr. HAYS. No, sir.

Mr. CANDLER. That was to pay for any cattle?

Mr. HAYS. That is, to pay for an animal any time that our inspectors made a mistake. We settle for it. There would not be

an appropriation made until 1920. Whether there will be one made next year or not, I do not know. I presume that if there is no State inspection there will be no State appropriation, but I am not certain as to that.

The CHAIRMAN. Do your State authorities desire to return to State inspection?

Mr. HAYS. I presume that the people I represent would be satisfied. How the State would feel about it, I do not know. I would be very glad to bring Mr. Howard down here, of the department of animal industry.

The CHAIRMAN. Dr. Mohler asked whether the people of Massachusetts objected to paying the losses on the cattle of other States.

Mr. HAYS. I never heard of any objection. I think Mr. Howard, of the department of animal industry, would be satisfied to go back. I do not believe there would be any objection on the part of the Commonwealth. I know there would be none on the part of the people I represent.

The CHAIRMAN. Why was the transfer made from the State inspection?

Dr. MOHLER. Because Brighton was a public stockyards, where cattle were brought from all the States in the New England territory. This all goes back, you know, to over a year ago, when the court of appeals in Kansas City ruled that Missouri had no power to issue regulations with reference to bringing cattle from other States into Missouri that did not conform to the Federal regulations. As soon as that was done, the people of Missouri felt, inasmuch as this ruling rendered all of the Missouri regulations governing the importation of live stock ineffective, that it was necessary for the Government to protect the live stock of their State, and they wrote to the Secretary.

Senator Reed and several others, and Mr. Rubey also, indicated strongly that it was necessary to protect Missouri. We could not protect Missouri without protecting the other 47 States; and as the result of what the court did with reference to this case in Missouri, the Secretary on the 1st of July issued regulations prohibiting the movement interstate of any dairy or breeding cattle unless the tuberculin test had been applied. In order to facilitate the movement and to prevent any hardships to shippers, he stationed men around in the stockyards, and Brighton was one of the yards where he put men, in order to accommodate the owners of cattle.

The CHAIRMAN. These cows are subject to Federal control while in interstate commerce?

Mr. HAYS. Yes.

The CHAIRMAN. The Government has men in Massachusetts and in other States?

Mr. HAYS. Yes.

Mr. RICKER. May I ask, Dr. Mohler, whether the cattle there are killed that are condemned under your inspection?

Dr. MOHLER. As a rule they are slaughtered.

Mr. RICKER. Under whose order?

Dr. MOHLER. Either the owner or the State. There is no order issued by the bureau. There is usually a request from the owner to get them slaughtered promptly. They could be shipped back to the State of origin in case they are pure-bred animals.

The CHAIRMAN. Cattle might be required to be examined before coming from these other States?

Dr. MOHLER. Yes; we are only doing this as a matter of accommodation.

Mr. RICKER. Mr. Chairman, we appreciate this accommodation very much, but we do not appreciate this shock. Right here, August 11, I had 12 animals condemned by this bureau and 7 of them proved to have been sound and all right. That entailed a loss to me of over \$1,200 on those cattle. I had animals in there, grade animals, for \$250 apiece, that did not bring me over \$35.

Dr. MOHLER. Would the State of Massachusetts be willing to have cattle shipped in from Vermont and New Hampshire and other States, found to be tuberculous, killed, and then the State of Massachusetts pay for them?

Mr. RICKER. No, sir; and we have never asked for that. The State paid when they made mistakes—just such mistakes as the Federal Government is now making. When they killed sound animals, then they were willing to pay in full. In the case that has been spoken of here I had that animal sold for \$125. The Federal man—or the State man before the Government took it over—would take that sale for the price of the animal. If the animal was not sold, the agent of the bureau would come around and fix the price of that animal.

Mr. JACOWAY. It is against the law to ship tuberculous cattle in interstate commerce?

Mr. RICKER. Yes.

Mr. JACOWAY. Is it not a great privilege to allow the shipment of cattle into Brighton market in this way?

Mr. RICKER. Yes.

Dr. MOHLER. Of course, it would cost considerable money to test these cattle, 75 to 125 every week, in Vermont and New Hampshire.

Mr. RICKER. Yes. All that we are getting at is these cattle that prove sound. That is what we want to impress on this committee's minds.

Mr. WILSON. Does it not appear to you, Doctor, that your inspection there is faulty?

Dr. MOHLER. I believe we have made a number of unpreventable errors there, and I think there is a great deal of merit in what Mr. Hays and Mr. Ricker have stated. I should like to see it so that when we make these errors we could reimburse the owners of the animals, especially where no lesions are found.

Mr. WILSON. I think that the inspectors there should be inspected as much as the cattle. That is the way it looks to me.

Mr. JONES. What is the opinion of the department as to the general proposition of making no reimbursement if the cattle are found to be tuberculous and full reimbursement where the cattle are found not to be tuberculous? I think the owners ought to stand the loss if they are tuberculous.

Mr. RICKER. The owners are willing to.

Mr. HAYS. You understand that we do not object to that?

Mr. JONES. Yes; I am asking Dr. Mohler.

Dr. MOHLER. My general opinion is that in the work of tuberculosis eradication we would not make as much progress if we elim-

inated the indemnity. I think it is the wiser policy for us to continue the indemnity in the tuberculosis eradication work for some time to come. I think Prof. Smith made the point this morning that it is a great encouragement to a young man who has a large percentage of infection in his herd to know that he is going to get something for those animals that are found to be tuberculous.

Mr. JONES. Yes; and would it not come about the same if it were not tubercular?

Dr. MOHLER. No. The amount of unpreventable error on the farm is only about 5 per cent. The amount of these errors in the Brighton yards, according to our figures, is 25 per cent. The error in Chicago and Kansas City and some of these other yards is far less than what the Brighton figures have been. The only way that I can explain the great number of no-lesion animals found there, after reacting to the tuberculin test, is just as I have stated, that these animals are all dairy cattle, and they are being forced and bagged up in order to make a good appearance for sale. They are bagged up, fed highly, and pampered, in order to make the very best showing on these two sales days.

Mr. JONES. There is no Federal legislation whereby the Government could reimburse these men for the losses where the cattle are found to be tuberculous?

Dr. MOHLER. No, sir.

Mr. JONES. The only remedy would be by additional legislation?

Dr. MOHLER. Yes.

Mr. McLAUGHLIN of Michigan. I am very sorry, indeed, to hear of this faulty inspection by the Federal authorities, because this morning we were led to believe that the Federal inspection was the only one that could be relied on, and therefore it was necessary to have a Federal appropriation.

Dr. MOHLER. I think that the inspection is more competent than is indicated by the figures. I think Mr. Ricker will admit that the results are no worse since the Federal inspection began than when the State had entire control of the inspection. The difference is that we do not pay any money to Mr. Ricker, and he is objecting because we do not reimburse him for the no-lesion reactors, whereas the State did.

Mr. McLAUGHLIN of Michigan. Mr. Ricker and Mr. Hays both said the percentage of mistakes was less under State inspection than under Federal inspection.

Dr. MOHLER. Have you figures, Mr. Ricker, to prove that?

Mr. RICKER. I have not.

Dr. MOHLER. That is not the point you are making, as I understand, is it?

Mr. RICKER. Not at all.

Mr. McLAUGHLIN of Michigan. I inquired what the percentage was under State inspection as compared with what the percentage was under Federal inspection, and I believe they said they thought it was less under State inspection, but they said they did not have the figures.

Dr. MOHLER. There were two tests permitted under the State inspection. An animal was injected on Monday, and if she reacted she could then be reinjected on the following Monday. But you

never get the same results the second time as the first time, so it has become almost universally accepted that "once a reactor, always a reactor."

Mr. RICKER. May I ask Dr. Mohler a question? I have 20 animals tested in Vermont to-day, and I will bring them down to Brighton next Tuesday, and you will not accept the gentleman's test that you approved of a month ago, so you go to work and test those animals on that shipment within less than a week. Your men go right to work and do that week after week. How are you going to get by that?

Dr. MOHLER. I do not know of any man in Vermont who has been approved by Commissioner Brigham and O. K'd by the bureau whose tests we do not accept after the cattle reach Brighton. Naturally if the charts have been improperly or falsely prepared, or prepared by a man not approved by the bureau, we could not accept them.

Mr. RICKER. I will hand you a few cases.

Mr. JONES. We are here on this appropriation bill, which is a very different matter. This thing can only be cured by new legislation. This is more like the trial of a lawsuit. I suggest that we go on with the matter of this appropriation bill.

The CHAIRMAN. Were you through, Mr. Hays?

Mr. HAYS. I think I might suggest a thought. In talking it over I thought I had prepared a new bill, but it was suggested to me that an amendment could be made to your act. I am not familiar with your practice here, but was told that an amendment could be made so that a part of that \$500,000 which is now appropriated for that purpose could be used.

The CHAIRMAN. It would be new legislation, and subject to a point of order, but if it had sufficient merit the point of order might not be raised. That would be the quickest way to handle it, though I am not sure. We will have to locate the responsibility. If Dr. Mohler will locate the person responsible for this destruction of property, and also ascertain what the ultimate cost will be, I think that will help to clear the matter up. It would probably cost more to take care of this phase than it does to take care of the eradication.

Mr. HAYS. Assuming that there were 131 cattle, the total amount involved would not exceed \$20,000.

The CHAIRMAN. In Boston?

Mr. HAYS. In Boston; so that the aggregate amount could not be large. It is large to the individual, but not as a Federal matter.

The CHAIRMAN. The remedy, of course, would be to have the inspection made before you ship in interstate commerce. Then, it would be up to the State to meet the Federal Government on a 50-50 plan. After it passes the State line the department has no discretion in the matter.

Mr. HAYS. The answer to that is that they retest them at Brighton in most instances. They have the right, and they come down there with the papers and they retest them.

The CHAIRMAN. You mean the Federal Government?

Mr. HAYS. The Federal Government; yes, sir.

The CHAIRMAN. They would not go back on the test made in the State?

Mr. HAYS. If the cattle come from outside of the State, they test them before they leave in their home State. They test them by ap-

proved veterinarians, and when they get down there the State tests them again.

The CHAIRMAN. Under the law they would have to be tested previous to shipment. They might be entitled to reimbursement before the animals entered into certain limits, but, as I understand it, it is simply a matter of convenience. It is very unfortunate, because these gentlemen should be reimbursed; I think we all appreciate that. We are not sure, however, as to the responsibility for the killing. Of course, the Government is in a way responsible for errors made in the inspection, and, if it is possible to improve on that, it is a very important thing and it ought to be done. The committee will take the matter under consideration, and if we can find a way out, we will do so.

Mr. HUTCHINSON. I want to ask about this particular cow. Do I understand, Mr. Ricker, that the cow Mr. Hays spoke of was your cow?

Mr. RICKER. Yes, sir.

Mr. HUTCHINSON. You were offered \$125?

Mr. RICKER. I had her sold for that.

Mr. HUTCHINSON. You lost all control of it and had to take \$32?

Mr. RICKER. Yes. That was one case in 43.

Mr. HUTCHINSON. You had nothing to say as to how it should be sold?

Mr. RICKER. Not a word.

Mr. HUTCHINSON. And the hide, too?

Mr. RICKER. That amount includes the hide and meat.

Mr. HUTCHINSON. It brought more than \$32, did it not?

Mr. RICKER. It did not in our market. The hide brought about 25 or 28 cents per pound at that time.

Mr. HUTCHINSON. Do you know anything about what the animal dressed?

Mr. RICKER. I have the papers at home giving that information.

Mr. HUTCHINSON. You have those papers?

Mr. RICKER. Yes, sir.

Mr. HUTCHINSON. They were given to you?

Mr. RICKER. The slaughterhouse where they were slaughtered sent me a certificate of the slaughter of the animal and a check for \$32.

Mr. HAYS. I think it would be very interesting to the committee to see those papers.

Mr. RICKER. I can send plenty of them in.

Mr. SMITH. I just want to ask one question of Dr. Mohler. Is it safe to assume that if no lesions are found, the animal can be declared free from tuberculosis? In other words, is it not true that the ordinary Government inspection of the tuberculous carcass is really a general and not a special examination, and that if the carcass were dissected which, of course, would destroy the carcass, we would frequently find tuberculous lesions where they are not found in our Government inspections.

Dr. MOHLER. That is true.

Mr. SMITH. Therefore it is not safe to assume where there are no lesions on an animal, that it has not tuberculosis?

Dr. MOHLER. You understand, Mr. Chairman, that our inspectors in their meat-inspection work do not go in to determine whether the carcass has any little nodule or not. They endeavor to determine

whether a carcass is fit or unfit for food. If they found one little tuberculous nodule, this would show why the animal reacted to the tuberculin test, but it would not determine that the carcass was unfit for food. It would still be fit for food. So the Government meat-inspection work is not intended as proof for the accuracy of tuberculin, at least it is not practicable to make it that satisfactory, although we try to get our inspectors to make a most careful examination when these reacting cattle come in, as accurately as they can without destroying the meat, and as a result of that work they find more small and localized nodules when they know they are working on reactors. They go through a great many more lymph glands and cut the lung, liver, spleen, etc., into smaller slices. The result of that closer observation means little from a meat-inspection standpoint, because the carcass can be passed for food even though it may have more localized lesions than are required to make the animal react to the tuberculin test.

The CHAIRMAN. There is a certain deduction.

Dr. MOHLER. Yes, sir.

Mr. WILSON. How many inspectors have you at this yard?

Dr. MOHLER. On the tuberculin inspection?

Mr. WILSON. How many inspectors have made these inspections of these 318 cattle?

Dr. MOHLER. We have about three men now at Brighton stockyard and the State has an equal number.

Mr. WILSON. Do you know whether the same men made all these mistakes or not?

Dr. MOHLER. No. We investigated this several months ago, back in September. The Federal and State inspectors have all been making these tests, and they all average about the same; as I said before, the State had about the same experience. The stockyard is a pretty difficult place for making a tuberculin test. The animals are coming in from more or less lengthy trips on the trains into unfamiliar quarters, they have new attendants, they are watered out of buckets, and it is a great strain on these dairy cattle, some of which have just calved or are about to calve, to have the tuberculin tests applied under such conditions.

Mr. McLAUGHLIN of Michigan. The best thing to do is to require an inspection in the case before they are shipped out.

Dr. MOHLER. That is what I said at the beginning. The solution of this problem, to my mind, is to have certificates issued before the cattle leave the State of origin.

The CHAIRMAN. Doctor, will you investigate the other point, as to the responsibility for the destruction of the animals, and furnish the committee with the data?

Dr. MOHLER. Yes, sir; I shall be glad to do that and insert a statement in the record.

The CHAIRMAN. It will be some time yet before we report the bill. We will give it further consideration.

Mr. HAYS. Would it be agreeable, Mr. Chairman, if I assisted in sending such information as I can obtain?

The CHAIRMAN. We will be very glad to have it.

Mr. HAYS. And if you saw fit, we might bring the chief of the Department of Animal Industry here in person and let him testify

and have the value of his testimony so that we could come here with it.

The CHAIRMAN. We will probably be in session for several weeks. We will be glad to hear you at any time, so as to get the matter straightened out. We would like to have all the facts.

Mr. McLAUGHLIN of Michigan. The chairman has asked Dr. Mohler to get the facts as to just how the business is transacted there. You might take it up with Dr. Mohler and find out just where the responsibility rests.

STATEMENT OF DR. JOHN R. MOHLER, CHIEF OF THE BUREAU OF ANIMAL INDUSTRY, DEPARTMENT OF AGRICULTURE—
Continued.

Dr. MOHLER. At your request, Mr. Chairman, I beg to submit the following statement regarding the tuberculin testing of cattle for interstate shipment at the Brighton public stockyards, after consultation with Dr. E. A. Crossman, inspector in charge at Boston, Mass.:

Prior to July 1, 1919, the tuberculin testing of cattle at Brighton was conducted under the supervision of the Massachusetts Department of Animal Industry. On this date regulation 7 of B. A. I. Order 263 became effective. This regulation required that all cattle moved interstate for dairying or breeding purposes, unless consigned to recognized public stockyards, must be tuberculin tested prior to shipment by an authorized veterinarian of the State or bureau. Accordingly, a conference was held at Boston, where representatives from all the New England States were present, and it was unanimously decided that in justice to the shippers of milk cows into the State of Massachusetts that a public stockyard should be established at Boston, Mass.

In order to accommodate the shippers of cattle who for many years had been making consignments to these yards for weekly sales, the bureau agreed to establish a public stockyard at this point in cooperation with the State officials. The commissioner of the Massachusetts department of animal industry, Dr. Lester H. Howard, proposed to the bureau that the State should furnish an equal number of veterinarians or lay inspectors to those assigned by the bureau. All cattle that passed the tuberculin test were to be tagged with a State tag bearing a serial number and furnished by the State of Massachusetts. These propositions were accepted by the bureau and have been constantly in effect since the establishment of inspection July 1, 1919, at which time four bureau and four State veterinarians and law inspectors were employed. As the number of cattle to be tuberculin tested decreased the number of veterinarians and lay inspectors decreased accordingly, but on the same basis, i. e., one State employee to each bureau inspector. At the present time three bureau inspectors and three State inspectors are employed at the yards. Prior to July 1, 1919, the State of Massachusetts paid the owner of an animal which reacted to the tuberculin test and where no lesions could be found on post-mortem examination, the full amount of the appraisal. The State department of animal industry was at that time, however, making a charge of 25 cents per animal for applying the tuberculin tests and the money collected from these fees was used to pay for the no-lesion reactors. At the present time no charge is made for these tests at the Brighton yards, and no payment is made for no-lesion reactors. At no time have Federal inspectors "ordered" the reacting cattle killed, nor have such cattle been "slaughtered by order" of the Government.

The supervision of these yards was taken over by the bureau as stated above, in cooperation with the Massachusetts department of animal industry, commencing with the weekly test of July 7, 1919. As a result of investigations made prior to assuming this supervision, it appeared to bureau representatives that the chief objection, if it can be so designated, to the work as it was conducted prior to July 1, 1919, was in the retesting of cattle which had apparently given typical reactions to the tuberculin test. The limitations of tuberculin as a diagnostic agent are well known. Chief among these limi-

tations is the fact that an animal which has once been given a typical reaction frequently fails to react a second time even though a very large dose of tuberculin is injected.

In connection with the testing at the Brighton yards, it must also be pointed out that the cattle are not presented in as nearly normal conditions as is required to secure the best results from the application of tuberculin. Investigations made by the bureau inspectors disclosed the facts that the cattle are improperly watered, are not milked out during the application of the test, are improperly fed or are fed too heavy a ration, and it might also be pointed out that the majority of the animals presented for test are those which have recently calved and in many instances have systemic disturbances which make for unsatisfactory results.

These improper conditions have been pointed out to one of the principal cattle dealers, Mr. W. A. Ricker, St. Johnsbury, Vt., in bureau letters of August 13, August 20, and October 9, 1919. The present knowledge of the bureau is that no steps have been taken to better the conditions.

As a comparison between the work carried on under supervision at these yards and that conducted on the farms in the accredited herd work, the following tables are worthy of note:

Subcutaneous tuberculin tests at Brighton stockyards, under the supervision of Dr. E. A. Crossman (July 1 to Nov. 1, 1919).

Number of animals tested.....	2,968
Number of reactors.....	332
Number of reactors showing no visible lesions.....	105
Number of reactors showing visible lesions.....	217
Percentage showing no visible lesions.....	32.3
Percentage showing visible lesions.....	67.7
Percentage of cattle reacting.....	14.0

Subcutaneous tuberculin tests on farms under the accredited herd plan, under the supervision of Dr. E. A. Crossman (July 1, to Nov. 1, 1919).

Number of animals tested.....	7,724
Number of reactors.....	237
Number of reactors showing no visible lesions.....	8
Number of reactors showing visible lesions.....	159
Percentage showing no visible lesions.....	4.7
Percentage showing visible lesions.....	95.3
Percentage of cattle reacting.....	3.0

This work in both fields is under the supervision of Dr. Crossman, inspector in charge, and is largely conducted by the same employees. It will be observed that under the accredited herd plan the amount of visible lesions found in cattle tested on farms is 95.3 per cent, while the amount of visible lesions found in cattle at the Brighton Stockyards is only 67.7 per cent. There seems to be no reason why such a wide variance of efficiency should be established in the two lines of work, other than those caused by the improper conditions under which these cattle at the yards have been tested.

In addition to the regular testing of cattle at the Brighton yards, it has been necessary to occasionally apply a retest to shipments of cattle that have been previously tested and accompanied by a suspicious test chart, in order to ascertain whether the practicing veterinarians approved to do this kind of work were conducting same in accordance with the regulations of the bureau. These retests have disclosed a number of tuberculous animals that had been classed as free from this disease by the practicing veterinarians applying the tests at the point of origin. It has been found necessary to disapprove one veterinarian for inefficient work, which was only possible to ascertain by applying retests on shipment when they arrived at the Brighton yards.

As a solution of this matter of indemnifying owners for cattle that react to the tuberculin test and fail to show lesions on post-mortem examination, it is suggested that the drovers request the original owners to sign an agreement for the cooperative tuberculin testing of their herds. This is being done by a few of the drovers at the present time, with the result that when reactors are

found, whether or not post mortem lesions are revealed, the drover refers back to the original owner through the live-stock sanitary commissioner. The entire herd is then tested and the owner indemnified partially for the reactors. This method is employed in the State of Vermont. The live-stock sanitary commissioner of the State of New Hampshire has agreed to pay indemnities on this same basis. While the live-stock sanitary commissioner of the State of Maine has not gone on record, it is felt that such a plan would be approved in that State. The bureau would then pay its proportion on such animals condemned, not to exceed \$25 on a grade animal or \$50 on a pure-breed animal.

Mr. McLAUGHLIN of Michigan. Under this tuberculosis item is the proviso "That the Secretary of Agriculture may, in his discretion, under such rules and regulations as he may prescribe, permit cattle which have been shipped for breeding or feeding purposes from one State, Territory, or the District of Columbia to another State, Territory, or the District of Columbia, and which have reacted to the tuberculin test subsequent to such shipment to be reshipped in interstate commerce to the original owner." Some serious difficulty has arisen on that, as shown in this Boston case. Do you think that ought to stand? Has it proven wise to put that into the law.

Dr. MOHLER. That clause has proved very satisfactory and the Secretary has given permission in certain regulations, for only pure-bred cattle to be returned to the State of origin. Almost every State now has a requirement that cattle coming from an outside State must be subjected to a retest 60 days after the animals come into the State of destination.

Mr. McLAUGHLIN of Michigan. But he may permit them all to come without the testing?

Dr. MOHLER. Not unless they are consigned to public stockyards.

The Secretary may, in his discretion under the law which you have just read and under the rules which he has prescribed, permit such cattle as may have reacted to the tuberculin test, to be reshipped to the State whence they came.

Mr. McLAUGHLIN of Michigan. Have you been acting entirely in keeping within this act in permitting such cattle as this cattle dealer spoke of that were not brought in for breeding or feeding purposes, but as milch cows?

Dr. MOHLER. Yes, sir; we have conformed entirely to that act. These milch cows are for breeding purposes as well as for the dairy. That animal of Mr. Ricker was not returning to the State of origin and he made no such request. This provision here is to allow an animal, that came from one State and then found tuberculous in another State, to be returned to the State of origin.

Mr. McLAUGHLIN of Michigan. But it was under that portion of the act that you permitted these cattle to come from different States to Boston without being inspected in the State from which they came. You permitted them to come to Brighton without being inspected and you were only authorized to return those to the State from which they came, those that were brought in for breeding or feeding purposes.

Dr. MOHLER. Mr. McLaughlin, pardon me, but you are mistaken in your interpretation of this paragraph. This paragraph has nothing at all to do with the bringing of that animal from Vermont into Brighton stockyards. That cow was supposedly healthy. Nobody

knew she was diseased until she got to Brighton stockyards and reacted to the tuberculin test. If she were to be returned to Vermont this paragraph would obtain. When that animal was shipped, as I said before, from Vermont to Brighton stockyards nobody knew whether she was going to react or not.

Mr. McLAUGHLIN of Michigan. No, you never do.

Dr. MOHLER. That is true.

Mr. McLAUGHLIN of Michigan. But when you were talking to Mr. Ricker and Mr. Hays about their case, you said the animal could have been reshipped to the State from which it came.

Dr. MOHLER. Yes; under this paragraph.

Mr. McLAUGHLIN of Michigan. Under this paragraph?

Dr. MOHLER. As a pure-bred Holstein she could have been returned to Vermont under our regulations.

Mr. McLAUGHLIN of Michigan. It was not brought in for breeding or feeding purposes.

Dr. MOHLER. All these dairy cows are brought in for breeding purposes. They are dairy cows and are intended for breeding purposes as well as for dairy purposes. A lot of these animals are sold as springers, and as soon as they freshen, they are again bred.

Mr. McLAUGHLIN of Michigan. You are mistaken about that. Mr. Ricker said he had 75 men in different parts of the country buying cattle for him, and evidently he bought cattle that would sell on the market at Brighton. He was bringing in breeding cattle or feeding cattle. He was bringing in anything in the shape of cattle that would sell on the Brighton market.

Dr. MOHLER. For what purpose?

Mr. McLAUGHLIN of Michigan. Any purpose.

Dr. MOHLER. No, sir; that is a dairy cow market, and not a feeder or fat stock market, Mr. McLaughlin. They don't have any and every kind of cattle that you refer to. It is a dairymen's market for the New England States. Those cows are either springers or fresh cattle. I have been familiar with this market for 20 years.

The CHAIRMAN. If they are shipped in for slaughter they can not be returned.

Dr. MOHLER. No, sir.

The CHAIRMAN. If shipped as dairy cows or as breeders or feeders, they may be returned?

Dr. MOHLER. Yes, sir; if pure bred.

The CHAIRMAN. All the dairy cows would come in under this term "breeder"?

Dr. MOHLER. Yes, sir; a great many of them would come in under "springers," and others under "fresh cows."

Mr. McLAUGHLIN of Michigan. Does this work well?

Dr. MOHLER. It has worked very satisfactorily because we have allowed it to be applied only to pure-bred animals, and the reason I say it has worked so well is because so many States have this provision for retesting after 60 days. For instance, pure-bred cows that have gone into Montana from Iowa have been retested 60 days after they were tested in Iowa and have reacted. It may be that these cows are worth little to the man in Montana, but are worth a good deal if returned to the original owner in Iowa,

or the State of origin, for breeding purposes. A gentleman who spoke this morning referred to a \$17,000 bull in Illinois that reacted 60 days after shipping from Oklahoma. He asked this morning about sending that bull back to Oklahoma, because the man that bought him in Illinois don't know how he can finance a diseased bull. He is a young man who can not take care of him under the system of segregation.

Mr. McLAUGHLIN of Michigan. But you say you permit return only in cases of pure-bred animals. Here are a lot of them brought in here not pure bred; shouldn't they have been inspected at the State line instead of being brought to Brighton and being tested there?

Dr. MOHLER. There are no facilities for inspection at the State line—no yard or station or anything of the kind. Here is a carload of 22 animals; you can't put them out in a snowstorm this time of the year at the State line between Vermont and Massachusetts. They have to go to a place where facilities for sheltering, watering, feeding, and testing are available.

Mr. RUBEY. The solution of the question would be to test them at the point of origin or shipment.

Dr. MOHLER. That is the proper thing, and that is what I suggested to Mr. Ricker. He said as he left the stand that he is having less trouble now than in July, because he is having these approved veterinarians do the testing in the State of origin and then shipping the cows to Brighton with proper tuberculin charts, which removes the necessity of having them tested in the stockyards.

Mr. McLAUGHLIN of Michigan. Massachusetts has permitted those cattle to come into that State, and in all probability they are going to stay there. That being true, where is the interest of the Federal Government in them?

Dr. MOHLER. We have no power if they are going to stay in the State.

Mr. McLAUGHLIN of Michigan. Why do you go to inspect them?

Dr. MOHLER. Because they are public yards handling cattle in interstate movement. In case the owner reshipped diseased cows to New York, Pennsylvania, New Jersey or Connecticut, from Brighton yards, our interest would come in very strongly. We wouldn't let diseased cows go out of the Brighton yards for shipment interstate. We haven't the power of course to prevent them from being shipped to any other place within the State.

The CHAIRMAN. What is the question in the Kansas City case?

Dr. MOHLER. That was the question involving the right of the State to make regulations independent of the Federal regulations. It was with reference to a shipment of cattle coming by railroad from Iowa into Missouri, and the State of Missouri had a regulation prohibiting the importation of cattle without a health certificate to protect the livestock of Missouri from foot and mouth disease. The State prosecuted the railroad company for transporting the cattle into Missouri in violation of its regulation, and the State won in the lower court. The higher court, however, reversed the decision and ruled that the State had no power to prescribe regulations in conflict with Federal law, and that the Federal statutes exclusively govern interstate shipments.

The CHAIRMAN. They can only be stopped by the Federal Government?

Dr. MOHLER. Yes, sir.

Mr. HARRISON. Did you call the committee's attention to the fact that we suggested the insertion of the word "hereafter" there so as to avoid the necessity of an annual repetition of this discussion?

Dr. MOHLER. Yes, sir; it is covered in this paragraph.

Mr. HARRISON. It is just a question of shortening the bill.

The CHAIRMAN. Let us get this matter of responsibility for slaughtering the reacting animals out of the way.

Mr. McLAUGHLIN of Michigan. Yes; we don't want to have to stand responsible for the killing of all those cattle.

Dr. MOHLER. The great trouble is in opening the door to all grade as well as pure bred cattle. It is going to allow every little Tom, Dick, and Harry all over the United States, after they have found they have got reacting cattle, to return them and there will be a great deal of trouble for the States to see that they are kept in quarantine.

Mr. McLAUGHLIN of Michigan. You can be quite sure they will not return the cattle, but if you give permission to do it you avoid the necessity of killing it and incurring the liability.

Mr. JONES. If you do not permit them to return it, the only thing to do is to kill it, but if you permit them to return it we won't be responsible?

Dr. MOHLER. Yes; but I think the better way of handling this is to allow these animals to come into the Brighton yards as they have done and if they react, put a button in their ear to show they are reactors and then let Massachusetts do whatever she wishes to do with them.

Mr. JONES. You simply test them and say, "Do what you please with them"?

Dr. MOHLER. Yes, sir. If we do the testing at Brighton and there are any reactors, let the local authorities at Brighton take such intrastate action as they deem proper.

Mr. JONES. If the facts are as Mr. Ricker stated here to-day, I don't see how the Government can avoid the liability there.

Dr. MOHLER. You can take my word for it that our man there never ordered the slaughter of those animals. The State has been doing this ever since the days of the old cattle bureau of Massachusetts.

Mr. JONES. You see, if we start in on a case like that and the Government loses out, you will have lawsuits here at the rate of \$20,000 a year.

Dr. MOHLER. I am satisfied that none of our men ordered the cattle killed.

Mr. McLAUGHLIN of Michigan. Suppose you found that the cow did react. Before the State of Massachusetts would assume the responsibility for killing her they would order her examined by their authorities, too, wouldn't they?

Dr. MOHLER. Yes, sir; they might, but they don't cooperate that way.

Mr. McLAUGHLIN of Michigan. And suppose your conclusion differed from the conclusion of the authorities of Massachusetts, what then?

Dr. MOHLER. We wouldn't allow that cow to go into interstate shipment.

Mr. McLAUGHLIN of Michigan. You have a way of preventing that?

Dr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. Wouldn't that be the way to do it?

Dr. MOHLER. I think that is much better than opening wide the door to all kinds and conditions of cattle.

Mr. McLAUGHLIN of Michigan. And not order your men to slay them?

Dr. MOHLER. I don't think they have done it. The gentlemen merely thought that was the way it was handled, but when I asked them how it was done before the 1st of July they stated it was the same procedure as prevails now. We have a very fine man of long experience in charge at Boston, and I am satisfied he is too wise to order the slaughter of those animals. However, we can stop him if he is doing so.

(Thereupon, at 5.30 p. m., the committee adjourned until 10 o'clock Thursday morning, December 11, 1919.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, December 11, 1919.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. Dr. Mohler, you may proceed.

BUREAU OF ANIMAL INDUSTRY—Continued.

FURTHER STATEMENT OF DR. JOHN R. MOHLER, CHIEF OF THE BUREAU OF ANIMAL INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. MOHLER. Gentlemen, last evening when you adjourned the hearings we were discussing the tuberculosis item. I think we have had a very complete discussion of this particular item.

The CHAIRMAN. We went over that thoroughly yesterday. Unless there is something you desire to add to what was said yesterday, we will pass it.

Dr. MOHLER. Here is a statement that I might put in the record indicating the amount of indemnity and expenses that have been incurred. Several members requested this information.

(The statement referred to follows:)

Claims recorded in the Tuberculosis Eradication Division for indemnity for cattle slaughtered from July 1, 1919, to Dec. 5, 1919.

State.	Number of cattle.	Total amount of appraisal.	Average amount appraisal per head.	Total amount of salvage.	Average amount of salvage per head.
Connecticut.....	25	\$2,310.00	\$92.40	\$664.15	\$26.56

The CHAIRMAN. We ought to have a complete statement in reference to that. That is one of the important items.

Dr. MOHLER. I will also submit a list of maximum State indemnities. Both Mr. Jones and Mr. Hutchinson requested some information about indemnities, so I had this list made up last evening.

(The matter referred to follows:)

Statement showing maximum indemnity paid by States for tuberculosis cattle destroyed and approximate amount of State funds for fiscal year 1920.

State.	Maximum indemnity.		Approximate State funds available for tuberculosis work, fiscal year 1920.
	Pure bred.	Grade.	
Alabama.....	(1)	(1)	\$5,000

¹ No indemnity.

² No limit, county pays.

³ No limit.

Summary.—State indemnity paid in 39 States. Average maximum State indemnity is \$102 for pure-bred cattle and average for grade cattle is \$60.

The CHAIRMAN. We would be glad to have all you have on the subject.

Dr. MOHLER. During the last fiscal year tuberculosis eradication work gained much popularity in the United States, and as the result of the demand for the work Congress increased the annual appropriation from \$500,000 per annum to \$1,500,000 per annum, \$500,000 of which was to be set aside for operating expenses and \$1,000,000

for indemnities. Congress evidently desired to keep pace with the demand for this work and to furnish to the live-stock owners of the United States full cooperation. As a matter of fact, however, the amount of cooperation the bureau has been able to give during the present fiscal year is little more than for the previous fiscal year.

During the previous year the work was more concentrated; we did not undertake to spread it into every State because of the limited amount of funds provided, but when the various States appropriated over \$2,200,000 our force was built up so that we could partially cooperate with practically every State. However, when the first third of the present year had passed, we found that we had spent almost \$200,000 or at the rate of \$600,000 for operating expenses, whereas only \$500,000 was available for operations. Likewise only \$52,000 were spent for indemnities in the first third of the year, or at the rate of less than \$200,000 per annum, which means a return of \$800,000 to the Treasury. Therefore, on November 8, 1919, the services of 20 veterinary inspectors assigned to tuberculosis eradication work were terminated. Immediately protests were sent in from the States from which these employees were discontinued. In a few instances arrangements were made to retain them. We are now confronted with an overexpenditure for the balance of the year of \$100,000 for operating expenses, and unless immediated relief is received it will be necessary to further reduce our forces at the rate of \$20,000 per month. This means terminating the services of approximately 100 inspectors.

Cooperation furnished by the States: The 45 States with which we are cooperating in tuberculosis-eradication work have an aggregate of approximately \$2,200,000. In cooperation with those States there were under supervision to November 15, 1919, 21,447 herds; up to the above-mentioned date there were fully accredited 1,391 herds of cattle; in addition to that number there were 16,341 herds which had passed one successful test in preparation for being accredited; in addition to those herds there were over 3,200 herds whose owners had signed the agreement placing their herds under supervision so that they might be accredited in accordance with the uniform plan. In many of the States it has been necessary to refuse to accept any more agreements from owners, on account of an insufficient number of inspectors to make tests.

The accredited-herd plan: This plan was adopted December, 1917, by the United States Live Stock Sanitary Association upon a recommendation from a joint committee representing the pure-bred cattle associations and live-stock sanitary officials. The plan was approved by the bureau December 23, 1917; therefore, the plan has been in operation less than two years and it is safe to say that it is the most-talked-about plan of eradicating tuberculosis that exists in the world.

It is a simple plan and any person who reads it will readily understand it. It has been approved by every pure-bred cattle association in the United States. After two years of practical operation it was referred to a joint committee representing the same association; this committee met in Chicago, December 2, 1919, and after a thorough consideration of the subject it was the unanimous decision of the joint committee that no steps should be taken to lower the high standard of the present plan.

Eradication of tuberculosis from areas: In a number of States campaigns have been carried on during the present fiscal year to eradicate tuberculosis from circumscribed areas, such as counties. This work will increase very rapidly during the next fiscal year. The question now is: What credit can be given to the cattle owners of such territory when they have eradicated tuberculosis? It will be a gross injustice to them to keep them in the same status as States wherein it is known that tuberculosis exists extensively. It is recommended that when a county has demonstrated that it has eradicated tuberculosis of live stock that the interstate movement of cattle from such an area should be permitted without a tuberculin test.

Eradication of tuberculosis from swine: During the present fiscal year a number of investigations have been made as to the origin of tuberculous shipments of swine to official establishments. In numerous instances the bureau has been able to trace these tuberculous shipments from the killing floor back to the farm where they have originated and a campaign undertaken to eradicate tuberculosis from such farms.

We have made satisfactory advancement in perfecting our system of obtaining information so that we can trace a larger percentage of tuberculous shipments. This work will be carried on more extensively during the next year and should develop into a very complete system of tracing shipments from packing centers to farms and exterminating the disease where found.

The next item is, on page 46, No. 62, "for all necessary expenses for the eradication of the southern cattle tick." This appropriation calls for no increase. I do not know whether you would like to review the work done during the last year, but I might say that up to and including December 1, 1919, we released from quarantine 62 counties and 33 parts of counties, constituting an area of 50,555 square miles.

Mr. TINCHER. You say you have released that territory. Is there a decrease in the appropriation?

Dr. MOHLER. No, sir; for the simple reason that although we have released 14 counties in Alabama, 9 in Arkansas, 18 in Georgia, 11 in Louisiana, 3 in Oklahoma, and 7 in Texas, there still remains 219,581 square miles to be released. That means this territory which is in red [indicating on map] is still to be cleaned up and released from quarantine.

The CHAIRMAN. Kindly indicate the States.

Dr. MOHLER. I thought I would leave this table.

The CHAIRMAN. Your table gives that?

Dr. MOHLER. Yes; with the amount of territory that has been released and the amount still left in quarantine, giving the percentage. We have now cleaned up 70 per cent of the infested territory; we still have 30 per cent to clean up, and the hardest work is coming in this open-range country of Texas and Florida.

Mr. LEE. At this rate it will take about seven years, will it; something like that?

Dr. MOHLER. We are figuring on about 1923.

Mr. LEE. That is earlier than I expected.

Dr. MOHLER. Yes; but of course that is only an estimate.

Mr. TINCHER. What is the policy? You enforce a quarantine where they have the ticks?

Dr. MOHLER. We enforce no local quarantine; the State enforces the local quarantine and we regulate interstate shipments from the quarantined area.

Mr. TINCHER. What do you mean by releasing?

Dr. MOHLER. We dip these cattle from the early spring, say from the 1st of April, until the end of November, every 14 days. After the cattle show up without ticks on them and the territory is thereby cleaned of ticks, we take the territory out of quarantine by releasing it, so that those cattle that have been cleaned can then go to the other States without any restrictions whatever.

Mr. TINCHER. You lifted that quarantine some place in Texas, and a lot of those cattle were shipped into Greenwood County, Kans., last summer?

Dr. MOHLER. Yes.

Mr. TINCHER. And the tick showed up and ruined four or five good cattlemen up there.

Dr. MOHLER. It did not ruin them, did it?

Mr. TINCHER. Yes; that transaction practically bankrupted one of the best cattle men in Greenwood County, because he had a forty or fifty dollar loss on steers anyway, and then he had to dip them and abandon a pasture for which he was paying \$14 a head for the entire season, which was just too much for him. I have his name. They have several other men in Greenwood County who were severely injured by that proposition. Does the Government do anything for these men who have a right to rely on the proposition when the quarantine is lifted?

Dr. MOHLER. There were two breaks from Texas shipments last summer. One was the result of dipping in crude oil, which failed to kill all the ticks, the oil being permitted during the war period in lieu of arsenic, our regular dipping material, which was commandeered by the Government for warfare gas. The other was where cattle came from a clean territory in Western Texas, and picked up the infection going through a local stockyard. They picked up these ticks when little bits of mites, almost microscopic in size, and nobody saw these seed ticks until they developed. When the cattle got to their destination those little mites had become big enough to be seen, and then the State put a quarantine on the cattle until the animals were free from these ticks. They were dipped several times and most of them have come out satisfactorily. One of these breaks occurred in West Virginia and the other in Kansas. I did not know that anybody was ruined, because I understood from Mr. Mercer there were only a few deaths that had occurred.

Mr. TINCHER. That is the fact.

Dr. MOHLER. And if only two or three deaths occurred I do not see how it could ruin the person.

Mr. TINCHER. I do not know whether it is a Government or State regulation, but here is an expensive pasture, where the man is paying \$14 a head for the pasture; what regulation requires him to take his cattle out of that pasture?

Dr. MOHLER. That was probably done by the State Department. We do not require them to take the cattle out of the pasture at all. We have not any portion of Kansas under quarantine for ticks. In fact, Mr. Mercer was afraid we might put the counties under quarantine, but I told him as long as they would take care of it locally we

would not put any Federal quarantine on that section of Kansas. I believe he put the quarantine on and the results were very satisfactory.

Mr. LEE. In other words, instead of forcing them to take the cattle out of the pasture, they are forced to leave them in the pasture?

Mr. TINCHER. No; they take these cattle which they dip out of that pasture and keep all other cattle out of that pasture. That is the only way—

Dr. MOHLER. That is done to keep the disease from spreading. But you say he had a loss before they reached that stage; he had a loss of \$40 or \$50 a head on the market value of the cattle.

Mr. TINCHER. Oh; exactly.

Dr. MOHLER. I do not think the ticks ruined him, because Mr. Mercer informed me there were only a few deaths.

Mr. TINCHER. But here is what the ticks do: If you have to dip the cattle out in that country and abandon a \$14-a-head pasture, you add that to the loss all these men suffered last summer. We all hear people testify about the high price of meat, but we know that the men that handled three or four-year-old steers this year took that loss.

Dr. MOHLER. Yes; that is true.

Mr. TINCHER. I have heard, Doctor, in a roundabout way, that Mercer wanted to come before the committee on some occasion in reference to that. Has he said anything to you?

Dr. MOHLER. Not about coming here. In fact, all he said to me was he had heard in a roundabout way that I was going to quarantine Federally those few counties in Kansas. When he was here in Washington in the fall on some other business he stopped in to find out whether his information was true, and I told him, as long as they took care of it locally, the Federal Government had no intention of putting a Federal quarantine on that section of Kansas.

We put our men in there and inspected the cattle, and made them apply double dipping. After two dips they can go anywhere.

Mr. TINCHER. He made them take the cattle out of that pasture and not let any other cattle in there this season. He may have overdone the thing; I do not know.

Dr. MOHLER. I do not believe he did.

Mr. TINCHER. There were three or four other men whom it affected, too, and it was most disastrous to those three or four men.

Dr. MOHLER. Such unfortunate happenings are bound to occur as long as we have the Texas fever tick with us.

The CHAIRMAN. What is being done to clean up the yards?

Dr. MOHLER. We always clean up the stockyards, after we find them infested, by disinfecting with antiseptic solutions.

The CHAIRMAN. Cattle from these infested districts go through the stockyards?

Dr. MOHLER. We have two kinds of pens, clean pens and native pens. The native pens are pens for the cattle with the ticks on them and the clean pens are pens for the cattle that have been dipped or are from clean territory. It very frequently happens that a cow pony of the trader riding around the stockyards will carry a few ticks on the legs. These ticks are apt to drop off in clean

territory, lay eggs which hatch out and then three or four thousand ticks are born and they crawl around into clean or any other kind of pens. It is a very tedious job to keep clean pens in infected territory, so that there is no possibility of ticks being scattered from the native pens to the clean territory.

Mr. TINCHER. Where we appropriate money, what do you men spend it for?

Dr. MOHLER. We have 280 men working in these nine States and we pay their salaries, pay their traveling expenses, and the stationery and incidentals of that kind. We do not pay for any construction of vats or the purchase of any of the dips. That is all done by either State or county appropriations. Now the various States have 373 employees and the counties have 1,552 employees. This shows you how we are getting cooperation from the States. When this work started, a number of years back, we were the ones that had the largest number, just like we have to-day on the tuberculosis eradication. The States and counties have come along fast and they are furnishing more employees than the bureau; they are furnishing about eight to our one. The various expenses in 1919 are all stated on page 47. Here is the full statement, Mr. Tincher, of the expenditures for 1919: Salaries, \$512,166; stationery, \$1,793; traveling expenses, \$125,519; equipment and material, \$5,658; telephone and telegraph service, \$1,103; miscellaneous items, \$15,942, and wages, \$1,440.

Mr. TINCHER. I do not want to appear in the attitude of being against this appropriation; I think it is a very important one. I want to make a suggestion to you, however, that might be of value to you. Your inspectors ought to be cautioned about one little thing I know of. For instance, a man shipping a trainload of cattle from Texas, from a clean district, say, up into Kansas, has to unload at certain stations. There is no excuse for that inspector letting the railroads persuade him to hold a trainload of cattle in the yards for two or three days under the claim that he is looking for ticks when, as a matter of fact, he is doing it to accommodate some railroad employee who wants to use a car some place else. I had two trainloads of cattle held last fall at a station in Oklahoma, and I had to go there and stay five or six days (they were delayed to that extent), and when I got there I found the Government inspector holding them there to investigate for ticks.

Dr. MOHLER. There was no excuse for that at all.

Mr. TINCHER. And when I got on the job myself, I found he was simply holding them to accommodate the railroad, to let them accommodate some one else with the cars. It is purely a car situation. However, the intimation gets out, up in my neighborhood, that my cattle have come from yards where there is some question on about ticks being present. You can not be too careful about some fellow creating the impression that a man has ticks in his cattle. I found out this fellow——

Dr. MOHLER. If you will give me his name, I will find out about it, because there is no occasion for having the cattle held to investigate for ticks for two or three days.

Mr. TINCHER. He was just doing it to accommodate the railroad.

Mr. LEE. I should think it would be to the interest of the railroads to unload quickly.

Mr. TINCHER. They unloaded my cattle.

Dr. MOHLER. Is that the unloading for feed, rest, and water?

Mr. TINCHER. Oh, yes, they had to; but they were sparring along because they were up against it for cars.

Dr. MOHLER. Five hours is enough for them to investigate for ticks.

Mr. TINCHER. It did not hurt the cows, except the stigma of there being ticks there, and it prevents you from suing the railroad for damages and does away with your claim for delay.

Dr. MOHLER. Mr. Chairman, if there is nothing further on this item I shall leave the chart here showing the progress in tick eradication, to which Congressman Lee referred.

Mr. LEE. I do not think there is any more important work for our country than this field of work.

Mr. TINCHER. I do not want it done away with.

Mr. LEE. And I think the best thing in the world, if we had the money to do it, would be to go on and complete this thing in two or three years.

Dr. MOHLER. During the present year we have released from Federal quarantine the following area:

States.	Counties.		Square miles.	States.	Counties.		Square miles.
	Whole.	Part.			Whole.	Part.	
Alabama.....	14	10	12,991	Oklahoma.....	3	8	4,346
Arkansas.....	9	6	8,130	Texas.....	7	5	8,847
Georgia.....	18	6,942				
Louisiana.....	11	4	9,296	Total.....	62	33	50,555

Satisfactory progress is being made and a greater interest than heretofore is being manifested in tick eradication which is indicated by the increase in the amount of funds provided by the State and county authorities. Sufficient Federal funds should be provided for this project in order that the bureau may adequately cooperate with the States and counties requesting assistance during 1921.

The Alabama and Louisiana authorities hope to complete the eradication of ticks during the next year and are making plans accordingly. The bureau is unable to furnish adequate supervision to all the counties in Georgia that are now ready for systematic cooperative tick-eradication work. Under the State law of Texas compulsory tick eradication becomes effective on January 1, 1920, in zone 2, which will require considerable additional assistance from the bureau. It is also expected that bureau assistance will be requested for many counties in Florida during the next fiscal year. Additional information covering the entire work up to date is contained in attached statement of the progress in tick eradication from July 1, 1906, to December 1, 1919:

Progress in tick eradication, July 1, 1906, to Dec. 1, 1919.

State.	Counties infected July 1, 1906.		Counties infected Dec. 1, 1919.		Counties released.		Area infected July 1, 1906.	Area infected Dec. 1, 1919.	Area released.	
	Whole.	Part.	Whole.	Part.	Whole.	Part.			Square miles.	Per cent.
Alabama.....	67	4	8	55	8	51,279	4,825	46,454	91

¹ Only portions of 5 of the 61 counties were quarantined.

Areas released during the calendar year 1919 amounted to 50,555 square miles.

The next item is the dairy division work to which Mr. Rawl has already referred, and we will see that his testimony comes in its proper position in the record. Mr. Rommel will come next. He is not here just now, so I will complete my statement. He will be here in a few minutes, and I will see that his testimony also gets in its proper position.

The CHAIRMAN. Thank you, Dr. Mohler.

TUESDAY, DECEMBER 9, 1919—AFTERNOON SESSION.

STATEMENT OF MR. B. H. RAWL, ASSISTANT CHIEF OF THE BUREAU OF ANIMAL INDUSTRY AND CHIEF OF THE DAIRY DIVISION, DEPARTMENT OF AGRICULTURE.

MR. HARRISON. As Mr. Rawl is compelled to leave the city to-night I shall appreciate it if you will hear his statement this evening with reference to item 63, on page 48, "for all necessary expenses for investigations and experiments in dairy industry," etc.

The CHAIRMAN. We will be glad to hear you, Doctor.

MR. McLAUGHLIN of Michigan. Give your name in full.

MR. RAWL. B. H. Rawl, Chief of the Dairy Division, and Assistant Chief of the Bureau of Animal Industry.

Now, I suppose it is your wishes to review first the proposed items of increase and then give some consideration to the work in progress; is that satisfactory?

MR. McLAUGHLIN of Michigan. Take your own way about it.

MR. HARRISON. The practice has been, Mr. Rawl, to make a general statement to the committee about the work as a whole and then a specific statement about the increases which the department is requesting.

MR. RAWL. Our activities are very much the same as heretofore. The division of the funds, \$350,370, I have here in detail if you wish

it, showing exactly what work is done under each project. I can not review all projects except in a general way, unless you want to give considerable time to this division.

Mr. McLAUGHLIN of Michigan. Is that in such form that it can go into the record?

Mr. RAWL. Yes.

Mr. McLAUGHLIN of Michigan. I think that should be put into the record.

Mr. RAWL. I shall keep it for the time being; I may want to refer to it.

Mr. McLAUGHLIN of Michigan. You would wish it to go into the record?

Mr. RAWL. If you wish it.

Mr. McLAUGHLIN of Michigan. We would like to have it.

(The statement referred to follows:)

Dairy division allotment, fiscal year 1920, \$350,370.

Dairy administration: Administration, including all activities in the division that serve the division as a whole, such as files, stenographic force, dairy engineering, dairy statistics.....

\$37, 675

Dairy extension:

Supervision	9, 420
Southern dairying.....	10, 250
Northern dairying (cow testing).....	30, 295
Bull associations, extension.....	11, 740
Community development in dairying.....	1, 800
Cow-testing association investigation.....	3, 300
Bull associations investigations.....	3, 600

70, 405

Dairy manufacturing:

Supervision	11, 480
Creamery extension.....	8, 460
Cheese factory extension.....	10, 090
Creamery management investigations.....	6, 680
Renovated butter inspection.....	6, 240
Navy butter inspection.....	1, 000

43, 950

Dairy research laboratories:

Supervision	2, 760
Ice-cream investigations.....	3, 800
Butter and by-products.....	10, 380
Milk condensing.....	7, 120
Bacteriology of milk.....	10, 170
Nutrition of dairy cows.....	8, 640
Metabolism of dairy cows.....	3, 650
Manufacturing and ripening cheese.....	14, 970
Silage investigations.....	3, 820

65, 310

Market milk investigations:

Supervision	4, 680
Dairy sanitation investigations.....	3, 280
Cost of handling milk.....	5, 480
Cost of milk production.....	11, 410
Dairy sanitation extension.....	13, 740

38, 590

Dairy experiment farm, including experimental work on the farm:	
Supervision and maintenance.....	\$30,995
Housing and care of cattle.....	2,820
Feed production.....	3,925
	37,740
Western dairy extension:	
Supervision.....	4,260
Dairy farming.....	19,860
Milk work.....	3,600
Dairy manufacturing.....	7,280
	35,000
Improvement of dairy products.....	15,000
Dairy cattle breeding.....	6,700

Mr. RAWL. To review the work in a general way, the dairy division activities are divided into two large groups. One relates to the extension or the carrying out of information that is developed from time to time and aiding in its application. That is shown in the organization of cow-testing associations, bull associations, etc. It is shown also in demonstrating at certain factories new methods for the manufacture of products that I will speak of later. The extension activities of the dairy division are reduced, we think, to the very minimum, considering the character of the service that is rendered. I may add just a word here on the question that is often raised whether or not we were duplicating the work of the extension service in sending out specialists along different lines. We believe that the activities of this kind are reduced as low as they can be and get into effective use the information that the department is developing. Some of you will remember that I have in the past referred to the department's work in the southern mountains developing the cheese factories. Here is a chart showing its growth [displaying chart to the committee]. In 1915 we started the development of cheese in the southern mountains, away back in the mountains of Tennessee and North Carolina and West Virginia. We have four men in that field, employed jointly by the State extension departments and the Department of Agriculture.

One of the items here is for \$5,000 for cheese work of a similar character in the Western States.

Mr. McLAUGHLIN of Michigan. Do you carry that kind of work on in sections?

Mr. RAWL. Yes.

Mr. McLAUGHLIN of Michigan. How many different sections have you carried on the work in?

Mr. RAWL. Only one, of this particular kind of work.

Mr. McLAUGHLIN of Michigan. And now you are prepared to take it up in other sections?

Mr. RAWL. Yes; in the Western States, in the Rocky Mountains. You know cheese production is dependent a good deal on climatic conditions, cool weather, cool water, etc. The western part of the country contains some splendid cheese territory. This chart shows the development of a new cheese industry in the southern mountains, a territory equally difficult to develop as any region perhaps in the Western States.

Mr. JONES. Is that gross production in dollars and cents?

Mr. RAWL. Yes. It shows that in 1915 it was \$3,000; in 1916, \$50,000—I am giving you round figures; in 1917, \$116,000; in 1918, \$158,000; and in 1919, \$289,000. Of course, this is a comparatively small industry, but since it developed from nothing four years ago the showing made is very good. In time apparently there is likely to be a substantial cheese industry throughout all that mountain region as a result of this work.

Mr. JONES. Do I understand that in those States—

Mr. RAWL (interposing). North Carolina, Virginia, Tennessee, West Virginia, Georgia, and South Carolina.

Mr. JONES. There was no cheese production?

Mr. RAWL. No.

Mr. JONES. And in 1915 there was a cheese production in North Carolina mountain section that was \$3,000?

Mr. RAWL. Yes; you are correct.

Mr. JONES. And also in 1915 there was no cheese production in the other States?

Mr. RAWL. No.

Mr. JONES. And then in 1916 you added Virginia, Tennessee, and West Virginia?

Mr. RAWL. Yes.

Mr. JONES. And in 1917 there was cheese production in the same States?

Mr. RAWL. Yes.

Mr. JONES. And in 1918 you added Georgia?

Mr. RAWL. Yes.

Mr. JONES. And in 1919 South Carolina?

Mr. RAWL. Yes.

Mr. JONES. In order to have the records show up better, I should judge you ought to put in the record the production of one of the States; take North Carolina, for example; in 1914 there was nothing; in 1915, \$3,000; in 1916, \$43,000; in 1917, \$84,000; in 1918, \$114,000; in 1919, \$220,000?

Mr. RAWL. Yes.

Mr. McLAUGHLIN of Michigan. Why not put that in the record?

Mr. RAWL. I should like to do that, if you desire it. If you want to see the number of factories, here is another chart. I think this was the best way to show you exactly what we want to do in the Rocky Mountain district.

Value by years of southern cheese sold since factories were organized.

	1915	1916	1917	1918	1919
North Carolina.....	\$3,000	\$43,000	\$84,000	\$114,000	\$220,000
Virginia.....		3,000	20,000	24,200	30,000
Tennessee.....		2,000	9,000	12,300	18,000
West Virginia.....		2,500	3,000	7,600	16,000
Georgia.....				700	4,400
South Carolina.....					1,200
Total.....	3,000	50,500	116,000	158,800	289,600

Growth of the cheese industry in the southern mountains since the establishment of the first factory in 1915.

	1915	1916	1917	1918	1919
North Carolina.....	3	6	19	25	32
Virginia.....		1	8	9	7
Tennessee.....		2	5	6	7
West Virginia.....		1	1	1	2
Georgia.....				1	3
South Carolina.....				1	1
Total.....	3	10	33	43	52

Mr. ANDERSON. What did you have to do with this? You are taking credit for all this; what did you have to do with it?

Mr. RAWL. I didn't have much to do with it, except to get good men and see that they did their work well. This work was done in cooperation with the North Carolina State extension department.

Mr. JONES. Following out Mr. Anderson's suggestion, what did your people do to follow this?

Mr. RAWL. The work was begun by a man going into this territory and showing them how to organize a little cheese factory costing \$300 to \$400. Under his guidance the first factory was started in 1915. Since that time these cooperative employees have guided the development of the cheese-factory business in that region and taught the local men how to make cheese.

We now want \$5,000 for this kind of work in the Western States.

Mr. TINCHER. You are only asking for \$5,000?

Mr. RAWL. That is all.

Mr. McLAUGHLIN of Michigan. You are going into a territory in which no cheese has been made?

Mr. RAWL. In places some cheese is being made now. We are working there in cooperation with the State agencies. As to just where this additional work will be done will depend on circumstances.

There is another item of \$20,000 in connection with the educational work to take care of increased cost of transportation, supplies, and travel, and to increase bull association work. These associations have proven to be one of the best means of increasing dairy production.

From all standpoints the increasing of the production of the cows of this country is the most important of all considerations before both the producer and the consumer.

Economy of production is based more than anything else upon the quantity of production. The surest and cheapest way to increase the production of our herds is to use good sires. Our herds are small, averaging not more than five cows. Cow-testing associations can reach the herds of 10 or more cows, but can not the herds of 5 or less.

There are not a half million good bulls in the United States, but there are over 5,000,000 farms, on which the 24,000,000 cows are kept. This means that to secure the full use of the good bulls it will be necessary that the same animals be used on more than one farm. This can be accomplished by cooperative bull clubs.

The scheme permits of a rotation of the bulls and the continuance of the services of good bulls for several years without inbreeding. The bull club is practical and has been demonstrated to be successful.

It provides a good bull at a much lower cost than a poor one under the present system. It is believed to be the best way of instructing the small producers not only in better breeding, but in better feeding and management.

The department started the bull association work as an extension project in 1915, and since that time associations have been organized in 27 States.

During the first several years the funds for bull associations were used in investigating methods of organization, by-laws, and details of carrying on such organizations. The present expenditures for bull association work amount to \$15,340 per year.

The total increase for the dairy division is \$40,430, but taking into consideration the transfers to the statutory roll, it will amount to \$11,720 more.

Mr. McLAUGHLIN of Michigan. This is a matter that does not require much knowledge or skill. This bull business has been going on since the beginning of time. How do you justify the Federal Government going into that?

Mr. RAWL. In this way: The organization of bull associations is highly specialized extension work and to be successful requires experienced men.

Mr. McLAUGHLIN of Michigan. Is that strictly true, Mr. Rawl? I have heard of bull associations in different parts of the country for many years.

Mr. RAWL. In 1908 there were 3, and at the present time there are 78. That is all of this type of organization now—78 in the United States. We find that by sending men out that are capable and experienced in this work that they can introduce it.

Mr. ANDERSON. How many men have you had working on this proposition?

Mr. RAWL. Five.

Mr. ANDERSON. How long?

Mr. RAWL. We started out with one man four years ago and increased last year to five.

Mr. McLAUGHLIN of Michigan. You said, I believe, that the county agents, could not to the best advantage carry on that cheese work, and I thought perhaps that was true; one must go who knows something about making cheese.

Mr. RAWL. To get it established.

Mr. McLAUGHLIN of Michigan. But couldn't the county agent make the suggestion to the farmers that they organize into an association and buy some bulls?

Mr. RAWL. Yes; they could; a county agent that understood it—there is no big secret about it, but they do not. Now, it takes some force to get the farmers interested in it and to put it through.

Mr. TINCHER. What do county agents do?

Mr. RAWL. Almost everything. Their duties are numerous; they are supposed to deal with all agricultural questions, and, of course, they must have aid in these special lines.

Mr. TINCHER. If they are any good and they need a bull association in their country, they will organize a bull association, won't they?

Mr. RAWL. I wouldn't say that. Of course, the county agencies have not been in existence long enough so that we can have a supply

of the best men. A county agent's work is about as responsible as any we have in agriculture.

Mr. TINCHER. Couldn't you publish this information in pamphlet form and ask them to organize in this manner? It would be cheap, and wouldn't it be just as effective?

Mr. RAWL. My judgment is it would not be as effective. We now publish and send to the county agent every detail concerning the organization and management of such associations.

Mr. JONES. Couldn't you get up a prospectus telling them how to go about it and explaining what you wanted them to do?

Mr. RAWL. Yes; we do this, but the county agents need more assistance; they must have the help of some one experienced in such organization until one such association is in successful operation. Even after this the assistance of such an experienced person is often sought by the county agent.

Mr. LESHNER. There are some associations in Pennsylvania who are doing this with hogs and have hog associations.

Mr. RAWL. Yes; and the whole purpose here is to induce the county agent to organize such associations and to aid him in carrying them on.

Mr. RUBEY. What do you pay these men?

Mr. RAWL. From \$1,800 to \$2,340.

Mr. RUBEY. Do they go to the county and into the territory?

Mr. RAWL. Yes.

Mr. RUBEY. And they stay about a little while and work it up and then go to another county?

Mr. RAWL. They pick a county which is adaptable and where the association is feasible, and then they try to organize one and stay in the county as long as necessary.

Mr. JONES. The county agent does not flop around like that; he stays in the county?

Mr. RAWL. The county agents' work is restricted to the county in which he is located.

Mr. JONES. Are they paid anything by the State?

Mr. RAWL. Yes; some of the men on bull associations are paid jointly by the department and the States but we have three men exclusively on our pay rolls.

Mr. JONES. The amount of salary you mentioned was the total salary?

Mr. RAWL. Yes.

Mr. RUBEY. Yes; I was asking about our own men.

Mr. McLAUGHLIN of Michigan. Mr. Rawl, I can see how you might do good and might properly carry on this work by issuing publications and issuing bulletins and publications, but I am a little at a loss how you justify hiring a number of men to go around into the States to induce the people to organize bull associations; why is that a Federal function?

Mr. RAWL. Exactly for the same reason that it was necessary a few years ago for the Department of Agriculture to induce the people to start county agent work. It is the department's function to exercise leadership and branch out in the development of such systems as are for the good of the people.

Mr. McLAUGHLIN of Michigan. A few years ago when the county agent feature was advanced the people were very much surprised at

the idea that the Federal Government would furnish money enough to furnish a county agent for each county in the country; they thought that was a wonderful proposition, and we are proceeding to that end. The Lever law is in force; it is growing in amount, and the number of men employed is increasing year by year; but we find as we are getting to that plan of having a man for each county in the country it still is necessary for us to have an expert go out and talk bulls, an expert to talk teas, an expert on this, that, and the other thousand and one different things, to go out and confer with and encourage the county agents. There are so many of them that they go around arm in arm, and in bunches in the country, each one an expert in his own line, neither one must interfere with the other one, and it seems to me we are carrying this expert business to a ridiculous extent and becoming very paternalistic.

Mr. RAWL. The Department of Agriculture believes that the need of its service by the people is just as great to-day as it was years ago. As we go forward our problems increase. Take this sire work. Our department has put on a publicity campaign that has been published in the papers all over the country, regarding the use of better sires. At the present time not more than few sires in use in our dairy herds produce daughters whose production is greater than that of their dams, and exceedingly few that are able to produce daughters of greater production than good dams.

Mr. TINCHER. That is pure, unadulterated carelessness on the part of the herdsmen, and that is not with reference to the expense, because it is cheaper—

Mr. RAWL (interposing). It is cheaper, under proper conditions, to own a good bull. But this is the condition that exists now.

Mr. TINCHER. Can the department in any way, with any amount of men, do anything to cure that situation?

Mr. RAWL. I think it can do a great deal to cure it.

Mr. TINCHER. Your idea is for the farmers to organize, so as to use the same sires?

Mr. RAWL. To begin with; yes; the best sires.

Mr. TINCHER. As a matter of fact, the sires, if taken care of, would cost practically nothing when they are calves. Each man could have his own bull and have a good one.

Mr. RAWL. The farmers often do not think they can. The calves, of course, do cost considerable—the real good calves. We think bulls are not good enough to use unless there is reason to believe they can sire daughters yielding 400 pounds of fat in a year. They will cost now about \$400 to \$500 apiece. The chief point in all this is that there are more than 5,000,000 farms with dairy cows, and there are, perhaps, not a half million good bulls in the whole United States. We can not hope, therefore, to improve herds rapidly in this country unless concerted action is taken to induce farmers to cooperate in the ownership of the good bulls we do have. It is wasteful to have one good bull on a farm with five cows when he could just as well serve similar herds on 10 farms, and by the system of rotation, as is the plan in the bull association, they would be available for not only two years but for eight or more years.

Mr. TINCHER. The States that have agricultural colleges are working on the same lines?

Mr. RAWL. Yes.

Mr. TINCHER. And carrying out into the counties the same ideas?

Mr. RAWL. Yes.

Mr. TINCHER. Comparatively few States have gone as far as we have?

Mr. RAWL. Few States have taken up full association work.

Mr. TINCHER. Don't you think what they ought to do is to encourage the owner, no matter how small his herd, to own a sire?

Mr. RAWL. No. Where a man has only two or three head of cows, it is perfectly feasible for a dozen or more such men to own one good bull.

Mr. HUTCHINSON. Before you get away from this I want to ask one question. I notice the appropriation is increasing all the time; you have \$40,000, or better this time, and still the price of butter and cheese is going out of sight; do the two follow each other; the more we give you, the higher the prices?

Mr. RAWL. Hardly, sir. We hope that some of the work we are doing will at least help to reduce prices.

The CHAIRMAN. What is your opinion of the present butter prices; how do they compare with the prices of other commodities?

Mr. RAWL. I have not reviewed that specifically in the last few months, but they are probably not out of line.

Mr. HUTCHINSON. Butter at 82 cents a pound is not out of line?

Mr. RAWL. Not when the prices of feed and labor are considered.

The CHAIRMAN. Does it compare favorably with other products?

Mr. RAWL. Generally speaking it does.

The CHAIRMAN. What does butter sell for at the creameries; not the retail prices?

Mr. RAWL. I don't know exactly what the quotations are, but they range around 74 cents in the New York market and 72 cents in Chicago.

The CHAIRMAN. At the creameries in the country?

Mr. RAWL. No; at the points mentioned.

The CHAIRMAN. All summer?

Mr. RAWL. No; at the present time. Butter has ranged from 48 cents in Chicago and 49½ cents in New York up to 74 cents, wholesale.

The CHAIRMAN. It has been below 50 cents a pound?

Mr. RAWL. Yes; in July. If you want some data on this, may I suggest that you ask the Bureau of Markets for it. That bureau is, of course, in closer touch with the market than we are.

The CHAIRMAN. I would like it in the record in connection with this. The question is raised all the time about the farmers robbing the country on the prices of butter. I want a comparison between that and other commodities.

Mr. RAWL. I stated that I did not believe that butter was out of line when the cost of feed, labor, etc., were considered.

The CHAIRMAN. It is certainly out of line with some commodities; it is low.

Mr. RAWL. You mean too cheap?

The CHAIRMAN. Yes. What is the average production per capita?

Mr. RAWL. There are about 16,000,000 to 17,000,000 pounds of butter produced in the Nation, and something over 100,000,000 of our people—

The CHAIRMAN (interposing). How many pounds per cow?

Mr. RAWL. According to 1910 census it was about 160 pounds per cow.

The CHAIRMAN. Take 160 pounds at 50 cents per pound, that would be per cow \$80? Do you contend that you can keep a cow a year for \$80?

Mr. RAWL. No, sir; but I am against that kind of cow. You can't feed a good cow and feed her as much as she needs for \$80 a year at the present time.

The CHAIRMAN. What does it cost to feed a cow if you are to buy the feed?

Mr. RAWL. I can not give you that at the present.

The CHAIRMAN. It seems to me that is a very important thing to know.

Mr. RAWL. The cost varies in different parts of the country.

The CHAIRMAN. The price of butter is higher than before; twice as high; about 30 cents a pound difference at the creamery?

Mr. RAWL. Yes.

The CHAIRMAN. Labor is about four times as high as it ever was; a wagon is three times as high, and everything the farmer buys is three or four times as high, and yet butter is about twice as high as it was.

Mr. RAINEY. In other words, the chairman of the committee feels that the farmer should get twice as much for butter as he is getting.

Mr. RAWL. I am sorry that I am not now prepared to give you that.

Mr. ANDERSON. Have you a bunch of cows at Beltsville?

Mr. RAWL. Yes; our books will show exactly what it costs to feed those cows. We have some cows that cost three or four times as much as the average cow.

The CHAIRMAN. How much does it cost?

Mr. RAWL. A cow that produces 800 pounds of fat will eat three or four times as much as some that produce 300 pounds.

Mr. McLAUGHLIN of Michigan. Have you a cow that produces 800 pounds of fat?

Mr. RAWL. We have one that produced 856 pounds, and we have a heifer that produced 756 pounds, and some heifers that produced five to six hundred pounds of fat.

The CHAIRMAN. How much are those cows worth?

Mr. RAWL. That would be only a guess.

The CHAIRMAN. What is the profit on the investment on your 800-pound cow?

Mr. RAWL. An 800-pound cow, ordinarily, if of good type and breeding, will bring \$2,000 or \$3,000; often more. I think the heifers I speak of would readily bring that amount.

The CHAIRMAN. What would be the profit, figuring the expenses, on your investment?

Mr. RAWL. The value of such animals depends largely on their use for breeding purposes. However, cows kept for butter production should produce 300 to 400 pounds butter fat per year and even when grades are worth from \$150 to \$300.

Mr. ANDERSON. You are keeping cows out there, aren't you?

Mr. RAWL. Yes.

Mr. ANDERSON. You know how much it costs to keep them?

Mr. RAWL. Yes.

Mr. ANDERSON. We want to know how much profit you have from those cows.

Mr. RAWL. I shall be glad to furnish you data showing what it costs to feed these cows, but can not do it offhand.

Mr. McLAUGHLIN of Michigan. What is the breed of those cows?

Mr. RAWL. They are Holsteins, the ones I have been speaking of.

Mr. RUBEY. You keep them for breeding purposes?

Mr. RAWL. We are using them in a fundamental breeding experiment.

Mr. TINCHER. I notice on this item it covers the inspection on the investigation of the dairy interests in various States, the inspection of renovated butter factories and markets. I wondered whether that was any duplicating section there when you finally get your bill through, Mr. Hutchinson?

Mr. HUTCHINSON. I was going to ask the Doctor if he has any knowledge how much butter is in storage?

Mr. RAWL. I did not quite understand your question?

Mr. TINCHER. I guess it is hardly a proper question; I wondered whether there would not be a double inspection under that cold-storage law.

Mr. RAWL. There is not at the present time.

Mr. TINCHER. Before you pass that, if the Hutchinson bill for a cold-storage inspection should become a law, which it probably will before we attack this bill, there will be a duplicate law for inspection, will there not?

Mr. RAWL. I couldn't tell you; I am not familiar enough with the details of the Hutchinson bill to answer that question.

The CHAIRMAN. What is this \$29,850 for?

Mr. RAWL. That is for research work, largely on dairy products, that I shall review briefly. When we work out an improved method for manufacturing a product, in order to get it into use it is necessary to go to certain factories and introduce it. It is necessary to do this also in order to carry the experimental work to a final completion. We begin in the laboratory on a problem and then go to the factory where we have commercial conditions, then we seek to introduce the final results into commercial plants.

In 1914 there was imported to this country from Switzerland over 22,000,000 pounds of Swiss cheese. This is one of the most popular of the foreign cheeses, and it is believed that the manufacture of this product in this country would greatly increase the consumption of cheese.

The Dairy Division has investigated the manufacture of Swiss cheese over a period of years, and has been successful in isolating the culture that produces the flavor and eyes, and has also been successful in using another culture which controls the development of the first-named culture.

The organisms of the type known as bacillus bulgaricus are introduced into the milk, and these control the fermentation and also inhibit the growth of other organisms, especially gas formers, and perhaps also make conditions favorable for the flavor producers.

The second culture which was discovered in the laboratories here is known definitely to produce the flavor and the eyes.

Check cheeses made from the same milk and under the identical conditions, but without culture, are without eyes and the characteristic Swiss cheese flavor.

In Europe and this country the making of Swiss cheese has up to this time been uncertain and only a relatively small percentage of the cheese made is the typical Swiss. At the Grove City Creamery, the management of which is under the supervision of the Dairy Division, Swiss cheese has been made on a large scale from milk received once a day and sometimes two days old. All of it is of the typical Swiss flavor and has the typical eyes.

Recently delegates from Ohio spent some time at the Grove City plant, and reported that they received their milk twice a day; yet they lose as high as 75 per cent of their cheese.

One of the very large New York manufacturers recently sent his head maker to Grove City to spend a week there. This manufacturer will use cultures and will provide curing rooms after the style of those at the Grove City Creamery. They report that under their present arrangement they lose much of their cheese.

A large manufacturer of Swiss cheese in Pennsylvania recently arranged to put in refrigerator and temperature control similar to those installed at Grove City.

Mr. McLAUGHLIN of Michigan. You made Swiss cheese in the department several years ago satisfactorily, didn't you?

Mr. RAWL. Yes; we did this by taking samples of cheese of high quality and using them as starters, and we got good results. Later on we succeeded in isolating the organisms. Only within the last year or two have we known exactly what organisms are necessary to produce the characteristic Swiss flavor and eyes.

Mr. McLAUGHLIN of Michigan. Can you find the organisms you speak of in the milk?

Mr. RAWL. Sometimes we do and sometimes not; that is where the importance of the work comes in.

Mr. McLAUGHLIN of Michigan. Do you have to go outside?

Mr. RAWL. What we do is to grow them outside and put them into the milk to make sure they are there. But the isolation of them is going to be of great value.

Another feature is our Roquefort-cheese work. Until now Roquefort cheese has never been made successfully in America; it has been tried for years. We have now developed methods of making a high grade of Roquefort from cow's milk. In France sheep's milk is used. The sample of Roquefort I have here shows what has been accomplished in this direction using cow's milk.

We get only about 6,000,000 pounds or so from France, but the imported French Roquefort is now selling at \$1.25 a pound. Cheese like this sample has been recently offered for sale in New York and Washington and brought 90 cents wholesale.

Mr. McLAUGHLIN of Michigan. Your product.

Mr. RAWL. Our product; the very first that was ever made, and this is the first that was ever made outside of a Roquefort-cheese cave in France.

Mr. RUBEY. Where is this made?

Mr. RAWL. In a factory at Grove City, Pa.; operated under our supervision.

Mr. McLAUGHLIN of Michigan. Your method of doing that is to send a man there and work with them?

Mr. RAWL. In Pennsylvania it is a factory where we have a working arrangement, and which is under our control. We are now in a position to send an inquirer to this factory, where he can see this method in use. Many people will avail themselves of the opportunity.

The CHAIRMAN. Tell us about the cave and the process.

Mr. RAWL. What we do is simply to take rooms and insulate them and maintain a temperature of about 50 degrees, and also maintain a saturated atmosphere; the condition in the French cave. Under these conditions the cheese is cured five or six months.

Mr. RUBEY. Does it take five months to do it this way?

Mr. RAWL. Yes; about five months.

This is not a very big industry now. It is a question whether our market should pay \$1.25 for the imported products, or a similar price for our own. By the development of a reliable method of making Roquefort in this country we can no doubt cheapen the cost of production, and this will be good for the industry as well as for the consumer. That is what we are trying to do.

The CHAIRMAN. What is the cost of making this at the present time?

Mr. RAWL. We have not gone far enough to establish these costs.

The CHAIRMAN. What is the Roquefort made of?

Mr. RAWL. A good grade of cow's milk.

Mr. McLAUGHLIN of Michigan. They are pretty far advanced in these matters in Wisconsin; had they successfully made Roquefort?

Mr. RAWL. No.

Camembert is another cheese we have done some work on. We have not developed a new method as in the case of the Swiss and Roquefort, but that is not necessary.

Mr. JONES. Have you found in that factory you are operating in Pennsylvania that it can be made for commercial use?

Mr. RAWL. We have made 10,000 pounds of Roquefort so far.

Mr. JONES. On that \$5,000 item you say three States; what three States are contemplated?

Mr. RAWL. In the Rocky mountain region. I don't know exactly what States, as yet.

In the production of butter I have mentioned to you before the possibility of utilizing skimmed milk. About one-half of our milk supply is devoted to butter production—about 40,000,000,000 pounds in round numbers. The factory as a rule buys the fat which constitutes about one-third of the solids and leaves the remainder for the farmer to use as best he can. Some of the skim milk is needed back home for young live stock. We could utilize 15,000,000,000 or 20,000,000,000 pounds of skimmed milk for human food if we developed the method for doing so and if the industries will take hold of it and develop the market for these products. The problems involved are numerous. Skimmed-milk powder is one of the products into which it can be made. This is a small industry as yet, consisting of only 10,000,000 or 12,000,000 pounds a year, but the food value of skimmed-milk powder is very great. Many problems concerning it are yet to be solved.

Another problem that we have been greatly interested in lately is the recovery of an edible albumen from whey. There is produced

annually in the United States as a by-product of the manufacture of cheese and casein approximately 3,249,000,000 pounds of whey.

This contains approximately 162,000,000 pounds of milk sugar, 32,500,000 pounds of proteins, of which about one-half is lact-albumen, and 26,000,000 pounds of ash constituents. All of this is very valuable food material. At the present time, it is largely fed to pigs and calves but for the most part in a very inefficient manner. A small amount is utilized in making milk sugar for which there is a limited market. Considerable quantities are absolutely wasted. We are now attempting to separate in a marketable form the proteins which have much the same chemical composition and physical properties as the white of egg. By a process involving concentrating, filtering, and drying a powder is obtained which contains all of the proteins and a small part of the sugar and ash constituents.

In this process about 1.2 pound of powder is obtained per hundred pounds of whey with about 4 pounds of milk sugar as a by-product. The crude milk sugar has at the present time a market value of about 15 cents per pound.

Preliminary baking tests have shown that this powder has the physical properties of egg white and in some ways is superior to egg white. Cakes made with the whey powder have a more satisfactory crust and retain moisture better than those made with egg. One pound of the powder will replace about 30 eggs in cake making.

On account of the lack of suitable machinery it has not been possible to determine the cost of manufacture.

There is little doubt, however, that it can be made to sell in competition with eggs at present prices.

The CHAIRMAN. How much will that cost?

Mr. RAWL. I don't know. I am not sure that it is feasible yet, but we have a process that looks practicable, though it has not been put to a final test.

In the ordinary process of making milk sugar the albumen is heated and filtered out. It is a strong-smelling congealed substance like an egg when it is cooked. This process that we are working on takes the albumen out in the uncongealed form, after which it is reduced to the form of a powder. The feasibility of this method is yet to be determined, and if the cost of production is low enough there is a possibility, at least, of this being very useful.

These are some of the problems we are working on.

Mr. McLAUGHLIN of Michigan. You spoke about the sugar in the milk. What form is it in? Does it resemble ordinary sugar?

Mr. RAWL. Somewhat.

Mr. McLAUGHLIN of Michigan. Has it the quality of ordinary sugar?

Mr. RAWL. Milk sugar has not the sweet taste of cane sugar. Its food value I believe is practically the same as cane sugar.

Mr. McLAUGHLIN of Michigan. In these problems you are working out are you making progress enough, you think, to justify the continuance of the appropriation for the work?

Mr. RAWL. Yes.

Mr. McLAUGHLIN of Michigan. How much money do you want for that?

Mr. RAWL. We want \$29,850, deducting from this a part of the sum transferred to the statutory roll. This does not cover milk

sugar alone, but all the additional by-products work we have discussed, including albumen, condensed milk, etc.

Mr. JONES. That is in this amount you are asking for?

Mr. RAWL. Yes.

Mr. JONES. As I understand you, you think there is a possibility of taking out of the whey the albumen, the sugar that is taken—

Mr. RAWL. Yes.

Mr. JONES. Sugar is taken out?

Mr. RAWL. Yes. Quite a commercial product.

Mr. JONES. I think you will find in late years it is used for child food.

Mr. RAWL. Yes.

Mr. JONES. I think all the leading child specialists are advocating it as a child food.

Mr. RAWL. The condensed-milk business is another branch that needs investigation. Our production jumped up from less than a half million pounds in 1909 to 1,675,000,000 pounds in 1918.

Mr. McLAUGHLIN of Michigan. In what year was the half million?

Mr. RAWL. That was 1909. We produced a great deal of condensed milk during the war and a great deal of it was imperfect.

The CHAIRMAN. The war had something to do with the demand, didn't it?

Mr. RAWL. Yes.

The CHAIRMAN. Will the demand keep up?

Mr. RAWL. The demand has kept up to date in a surprising way, very much more than we expected, but we are unable to tell what it will do in the future.

A lot of the condensed milk landed in Europe was spoiled and a lot here has spoiled. We ought to do a lot more work on condensed milk. It is a big industry and numerous intricate problems are involved.

Mr. McLAUGHLIN of Michigan. Condensed milk was made all right and kept all right many, many years ago. Have they forgotten how to do it?

Mr. RAWL. No. They have always had losses.

Mr. JONES. I think the war created such a demand for condensed milk that a lot of people who didn't know how to make it went into the business.

Mr. RAWL. That is true. There have been for many years some flarebacks with the very best manufacturers in this country. One of the defects in condensed milk is known as "buttons." On opening a can of condensed milk a little button would be found.

Mr. McLAUGHLIN of Michigan. What does that indicate?

Mr. RAWL. Such milk is unsaleable. It is due to a mould. We think we are getting at the cause of it.

There is a tremendous possibility for usefulness along these lines in building and strengthening the dairy industry and our agriculture as well. Developing these processes with increased efficiency will make the products cheaper to the consumer. I don't believe from what we know about Roquefort cheese, for example, that it will be necessary for the consumer to continue to pay the high price per pound that he does at present. But isn't it just to assume that the more we learn about improved methods the safer the business can be made and ultimately the more economically conducted?

The CHAIRMAN. Will you tell us something about casein?

Mr. RAWL. We have made quite extensive investigations on casein, directed primarily to the use of buttermilk, because buttermilk was a big by-product with us, and the sweet milk formerly used in making the better grade of casein is too valuable a food. Our interests have been to save sweet milk to eat and to manufacture it into something for that purpose, like powder, milk sugar, and albumen.

The CHAIRMAN. You say it is a good, wholesome product?

Mr. RAWL. Good skimmed milk makes—

The CHAIRMAN. I mean this casein.

Mr. RAWL. No; casein isn't a food. Paper makers like to use casein made from sweet skim milk. Such milk is not cheap enough to make the manufacture of casein attractive. We have tried, therefore, to develop a method for making good casein from buttermilk. We did a good deal of work during the war on making a casein for glue for aeroplane work. Considerable progress was made.

The CHAIRMAN. Can you extract it from milk?

Mr. RAWL. No; if it is removed from milk there is nothing but whey left. It is the substance of which cheese is made, taken out and dried. A large amount of our casein has been imported.

The CHAIRMAN. Milk contains 4 per cent of casein, does it not?

Mr. RAWL. Yes. Casein once dry is as hard as ivory. It is used for making glues, but more largely, perhaps, for glazing papers. The paper glazers have never taken very kindly to our buttermilk product. The manufacture of casein has not been an attractive business here under normal conditions ordinarily, because the price is too low to make the kind that the user wants. Does that answer your question, Mr. Chairman?

The CHAIRMAN. Do they mix much casein with butter?

Mr. RAWL. That isn't the general practice. Of course, it is illegal.

The CHAIRMAN. Butter has some casein in it?

Mr. RAWL. Yes.

The CHAIRMAN. About one-half per cent?

Mr. RAWL. No.

The CHAIRMAN. One and one-half or 2 per cent?

Mr. RAWL. One and one-half or 2 per cent.

The CHAIRMAN. Could any considerable amount be added to butter?

Mr. RAWL. It could be added.

The CHAIRMAN. That would detract from the palatability of it, would it not?

Mr. RAWL. Yes; it would result in a poor quality and would be classed as adulterated.

The CHAIRMAN. And practically nothing is being done with it?

Mr. RAWL. No; we hear of cases in which milk powder was added to butter, but this is not honest business.

The CHAIRMAN. What is it worth a pound?

Mr. RAWL. Before the war it was worth about 7 or 8 cents. During the war it ran up to about 22 or 23 cents.

The CHAIRMAN. It would lessen the cost of butter?

Mr. RAWL. Yes. If anybody could put it in and get by with it he could make money.

The CHAIRMAN. What is the observation with reference to casein?

Mr. RAWL. If we could make casein out of a product like butter-milk that would be good enough for glazing paper a lot of people would make it. At present the paper makers want a casein made from skim milk, which is too valuable to be used for this purpose. We have a product that is good made of buttermilk, but the paper makers are slow in using it. The Bureau of Standards says it is entirely satisfactory and gave good results in glazing paper, but the paper maker hasn't yet been willing to accept it.

Casein is a cheap by-product from a plant making other things.

The CHAIRMAN. How about the \$5,000 for dairy experiment work in the Western States?

Mr. RAWL. We would like to use some of these funds for developing cheese making in the Rocky Mountain region.

The CHAIRMAN. That has reference to Roquefort cheese?

Mr. RAWL. No.

The CHAIRMAN. What cheese do you begin with?

Mr. RAWL. Usually we begin with cheddar, the simplest style of American cheese. After they gain experience they can learn to make other cheeses.

Mr. HUTCHINSON. You said a while ago you would investigate the price of making butter.

Mr. RAWL. That should come from the Bureau of Markets. That bureau can give you these butter prices for every day in the year.

Mr. HUTCHINSON. I notice here in the last part of this item "For all necessary expenses for investigational and experimenting in dairy industry, cooperative investigations of the dairy industry, in the various States," these words "inspection of renovated butter factories and markets," etc.

Mr. RAWL. Those words have been in there a long time; "renovating butter factories and markets." A clause under the oleomargarine act covers the work we do with renovated butter, the approval of cartons, inspection of factories, and the collecting and testing of samples found on the markets. It is done through the meat-inspection service largely whenever there is meat inspection in the town where there is a renovating butter factory.

Mr. HUTCHINSON. You don't go to the butter prices at all?

Mr. RAWL. No. I would suggest that you secure from the Bureau of Markets a statement on butter because they can do it so much more readily than we can.

The CHAIRMAN. What is the next item?

Mr. RAWL. That is all I think of, sir. I might add this in closing: The dairy industry of this country is of enormous importance. The amount of money we are asking for dairying, \$390,800, is small compared to the size of the industry and its relation to the public welfare. I have told you something of the results secured. We desire to continue and to extend our research. This increase is needed also, in order that more men can be available to aid the factories in applying the methods of which I have been speaking.

Mr. HUTCHINSON. You cooperate with the county agents?

Mr. RAWL. We cooperate with everybody who will cooperate with us. I feel so keenly what dairying means economically and what it means to agriculture that it seems to me after all the department's activities the funds devoted to dairying are comparatively small when the great work involved is so significant.

The CHAIRMAN. There is plenty to be done in the cheese market. I want to congratulate you on your success with this Roquefort cheese.

Mr. RAWL. That is the first that has been made commercially.

(Thereupon, at 5.45 p. m., the committee adjourned until 10 o'clock Wednesday morning.)

THURSDAY, DECEMBER 11, 1919.

AFTER RECESS.

The committee reassembled at 2 o'clock p. m., pursuant to recess.

The CHAIRMAN. The committee will come to order.

Mr. HARRISON. Mr. Rommel, Chief of the Division of Animal Husbandry, is here, and he will present the item which appears on page 51. You will recall that we passed over that item when Dr. Mohler was before the committee.

The CHAIRMAN. Is Dr. Mohler through with his statement?

Mr. HARRISON. Yes, sir.

The CHAIRMAN. Then we will hear from you, Dr. Rommel, if you are ready.

STATEMENT OF MR. GEORGE M. ROMMEL, CHIEF OF THE ANIMAL HUSBANDRY DIVISION, BUREAU OF ANIMAL INDUSTRY.

Mr. ROMMEL. Mr. Chairman, what sort of procedure do you wish me to follow?

The CHAIRMAN. Make any statement that you may have to make in general, and when we reach the various items we may have some questions to ask you. If you have a statement that you prefer to make, make it in your own way as to the work and results attained and what information you can give the committee that will be of interest and value.

Mr. ROMMEL. The work of the Animal Husbandry Division is confined to research work on live-stock production, and to extension work in cooperation with the States Relations Service covering the lines of live-stock production, especially meat animals.

We also have charge of the work of encouraging the breeding of horses for military purposes, conducted in a very small experimental way. The work also covers research and extension work in poultry husbandry.

That in a broad general way is the scope of the Animal Husbandry Division. I can go into that in just as much detail as you desire, sir, or I can confine my remarks to the items in the estimate; just as you wish.

The CHAIRMAN. Did I understand you to say in cooperation with the States Relations Service?

Mr. ROMMEL. Yes, sir.

The CHAIRMAN. You might state how you cooperate with them.

Mr. ROMMEL. That is in the extension work, in the organization of pig clubs, in the beef cattle demonstration work in the South, in the farm sheep demonstration work, and in the poultry club work. Our work in the organization of pig clubs is gradually becoming work in swine husbandry. We cooperate with the States Relations

Service in this way: We have our men who devote their entire time to the extension work. They are stationed in the Animal Husbandry Division, and work through the States Relations Service, and through them with the agricultural colleges.

Mr. McLAUGHLIN of Michigan. How many men have you in that kind of work?

Mr. ROMMEL. I can't tell you exactly, Mr. McLaughlin. It is probably 50 or 60 all together, including the men in swine husbandry, in poultry, in sheep demonstration, and in beef cattle work in the South. I can give you that exactly after consultation with the records, if you wish it.

Mr. McLAUGHLIN of Michigan. Can you tell us how they do that work?

Mr. ROMMEL. Yes, sir. Those men work through the extension divisions of the agricultural colleges—the men who are stationed in the field—and those are 90 per cent of the men that are employed. They are stationed at the agricultural colleges and are part and parcel of the extension divisions of the agricultural colleges.

Mr. McLAUGHLIN of Michigan. What do they do?

Mr. ROMMEL. They give the information which a specialist can give on the problems of live-stock production in their particular field. For example, the sheep specialist in Michigan will act as the adviser of the country agents in the State and farmers as to problems of sheep production in that State. His field is to cover the entire range of production from the matters of breeding, feeding, parasite control, marketing wool, etc. Many of these extension specialists in sheep husbandry have exerted a powerful influence in the last two years in improving the conditions of disposing of the product. For example, our specialist in Iowa also acts as secretary of the State Association of Sheep Growers, and one of the things that these people have done in the last two years is to bring about a combination method of selling their wool. They have not yet combined on lambs, but they have on wool, and instead of the sheep growers of Iowa being dependent on the local wool buyer, who pays him what he thinks the wool is worth, the wool is pooled and sent to market in carload lots and brings what it is actually worth on the market.

Mr. McLAUGHLIN of Michigan. Is the man that works up this marketing proposition the expert on sheep diseases?

Mr. ROMMEL. No, sir; he is an expert on sheep husbandry. That is one of his problems.

Mr. McLAUGHLIN of Michigan. You spoke about the sheep diseases—parasites.

Mr. ROMMEL. That is one of the things that those men have to be up on, on the management of sheep in order to control parasites. The control of parasites in sheep, stomach worms, and things of that sort is as much a matter of management as it is anything else.

Mr. McLAUGHLIN of Michigan. You spoke of sheep diseases; that is one of the diseases of sheep, isn't it?

Mr. ROMMEL. Yes; but he is not specially an expert in sheep diseases. That is not his specialty; his specialty is sheep as a whole, and he has to be up on these other problems as well, the control of sheep diseases, the methods of marketing, and things of that sort.

Mr. McLAUGHLIN of Michigan. Do you have an expert for each disease?

Mr. ROMMEL. We have no experts on diseases in the Animal Husbandry division.

The CHAIRMAN. Who looks after that end of it?

Mr. ROMMEL. The Zoological Division are studying especially the question of sheep parasites. What we are studying is the matter of management of sheep, the rotation of pastures, and things of that sort, in order to prevent infection.

The CHAIRMAN. Are we to understand that you have a man stationed at each State college?

Mr. ROMMEL. Not at each college, no, sir.

The CHAIRMAN. How many have you?

Mr. ROMMEL. As I recall it, there are 15 specialists in sheep husbandry. I am speaking now from memory. I can check these for the record from our records.

The CHAIRMAN. Does he devote his time to instruction?

Mr. ROMMEL. He is on the extension staff of the college, in the extension division.

The CHAIRMAN. Is he paid out of Government funds?

Mr. ROMMEL. He is paid partly out of Government funds and partly out of State funds. The States, as a rule, pay the traveling expenses of these men. We pay part or all of the salaries. They pay in many cases a small addition to what we pay in the way of salaries. For example, we pay a man \$1,380, but you can't get an experienced man for \$1,380. The State may in such an instance add enough more to get an experienced specialist.

The CHAIRMAN. Does he travel over the State or is he instructing the students?

Mr. ROMMEL. He visits the county agents and the farm bureaus, bringing the information and expert advice directly home to the farm bureaus.

The CHAIRMAN. The county agents are not at State colleges; they are out in the counties.

Mr. ROMMEL. Yes, sir. I wouldn't have a specialist in extension work in a State who spent his whole time at the seat of the agricultural college. The specialist must get out over the State and get into contact with the farmers. That is where he does his valuable work.

The CHAIRMAN. He spends part of his time at the college and part of his time in the field.

Mr. ROMMEL. Quite so. He spends just enough of his time in the college to keep in touch with his office work. We require weekly reports from these men, and they have to show in those reports where they have spent the time during the preceding week. A man that spends more than two days in the week at the college is regarded as spending too much time in one place. I should say these men spend probably an average of two days a week at the college, and the rest of the time is spent out in the State.

Mr. McLAUGHLIN of Michigan. And the work of one of these men covers all the domestic animals?

Mr. ROMMEL. No, sir; these men, as a rule, are specialists in one particular class of stock. One man will be a specialist in sheep husbandry; another will be a specialist in swine husbandry; another one will specialize on beef cattle; another one will specialize in poultry.

Mr. McLAUGHLIN of Michigan. Isn't there a man at each one of the colleges, or there part of the time, and other places part of the time, respecting each kind of animal?

Mr. ROMMEL. You mean have we men of that kind? You mean has the department?

Mr. McLAUGHLIN of Michigan. Has the department?

Mr. ROMMEL. No, sir.

Mr. McLAUGHLIN of Michigan. How many different ones have you?

Mr. ROMMEL. We have in one or two States as many as three. There is no State that I recall right now that has more than three of these specialists from our pay roll.

Mr. McLAUGHLIN of Michigan. This is of your bureau?

Mr. ROMMEL. Yes, sir.

Mr. McLAUGHLIN of Michigan. At a college where you have three of these men, what does the work of each one cover?

Mr. ROMMEL. The State that I particularly have in mind has a beef-cattle man, a sheep specialist, and a swine specialist.

Mr. McLAUGHLIN of Michigan. And how many States have three?

Mr. ROMMEL. Mississippi, Missouri, and Tennessee each have three.

Mr. McLAUGHLIN of Michigan. Do several have two?

Mr. ROMMEL. Oh, yes; several have two.

Mr. McLAUGHLIN of Michigan. And how many have you altogether?

Mr. ROMMEL. I can't answer you that exactly. There are between fifty and sixty, I should say, quoting simply from memory. I can verify that for the record if you wish.

Mr. McLAUGHLIN of Michigan. There would be several States, quite a number of them, in which no men of that kind are employed?

Mr. ROMMEL. Yes, indeed. We have not been able to meet the demand for these men at all. They are asking us for more assistance along this line than we are possibly able to render.

The CHAIRMAN. The table on page 53 indicates that you employ 101, and 17 more would make 118 people.

Mr. ROMMEL. The total number of men employed in the division at the present time, including laborers and clerks, is 174. That is shifting more or less from time to time. Of these 174 men, there are 41 in Washington, 133 in the field. Twenty-two of these men are technical employees in Washington.

The CHAIRMAN. Are they paid out of your funds?

Mr. ROMMEL. Yes, sir; they are paid out of the appropriation for the animal husbandry division.

The CHAIRMAN. Part by your division and part by the States Relations Service?

Mr. ROMMEL. The States Relations Service does not pay anything toward their salaries. Some of these men in the field are paid by the State Smith-Lever fund—the State funds.

The CHAIRMAN. The salaries indicated on page 52—are those the total salaries paid?

Mr. ROMMEL. Approximately.

The CHAIRMAN. Are they paid by the State also?

Mr. ROMMEL. No; the salaries paid by States are not indicated there.

Mr. McLAUGHLIN of Michigan. These are the amounts, then, that are contributed by you?

Mr. ROMMEL. Yes, sir.

Mr. McLAUGHLIN of Michigan. As a portion of the salaries?

Mr. ROMMEL. Yes, sir.

The CHAIRMAN. As a portion or as a whole of the salaries? Do they get any salary outside of what is indicated here?

Mr. ROMMEL. Some of these cooperative extension men get money from State sources.

The CHAIRMAN. Aside from the salaries indicated on page 52?

Mr. ROMMEL. Yes, sir.

The CHAIRMAN. We should know how much.

Mr. ROMMEL. I can furnish that to you.

The CHAIRMAN. We would like to have it now or have it before we make up the bill. What are the salaries paid them?

Mr. ROMMEL. In addition to that?

The CHAIRMAN. Yes.

Mr. ROMMEL. I could only guess at that now, Mr. Chairman. I could furnish that to you by to-morrow morning.

The CHAIRMAN. Do you prefer to wait until to-morrow morning with your testimony, or will you go on now and bring it in to-morrow?

Mr. ROMMEL. I am at your disposal. I am ready to go ahead now if you like, or I can appear again to-morrow morning.

Mr. McLAUGHLIN of Michigan. I suppose none of these men get more than they are entitled to. None of the wages seem to be very big.

The CHAIRMAN. That all depends on what is paid by others.

Mr. McLAUGHLIN of Michigan. Yes; I was going to say, but if he is paid another salary in addition to the one he gets here—and what is that rule about \$2,000?

Mr. HARRISON. He can not receive more than \$2,000 from the Government. That does not apply to State funds.

Mr. McLAUGHLIN of Michigan. But some of that money he gets in the State is Federal money.

Mr. HARRISON. It becomes State money after it goes to the State, but of course we have authority to consider and approve projects and to check expenditures.

Mr. McLAUGHLIN of Michigan. Oh, is that the way you figure it?

Mr. HARRISON. The money available under the Smith-Lever Act is paid over to the State.

The CHAIRMAN. How many do you have?

Mr. HARRISON. I could not answer that question offhand, Mr. Haugen. There are many cooperative arrangements throughout the department. It is my recollection that this matter has been discussed before the committee for several years, and I think it has been made clear that, in many instances, we have cooperative arrangements with the States by which we pay a part of the salaries of some of our employees and the States pay the remainder. And the committee has been fostering the idea of cooperation.

The CHAIRMAN. But the book should indicate the amounts paid.

Mr. HARRISON. Those tables indicate the expenditures by the Department of Agriculture.

The CHAIRMAN. We have been told that they indicate the salaries paid by the department.

Mr. HARRISON. That is what they do indicate.

The CHAIRMAN. There are other additional salaries paid.

Mr. HARRISON. But we do not pay them.

The CHAIRMAN. The salaries are paid and we are supposed to know what the salaries are.

Mr. MCKINLEY. Would the department really know?

Mr. HARRISON. Our records show the total compensation received by our cooperative employees, but the form of these tables, as I explained the other day, is prescribed by the Treasury Department under a law passed by Congress. We are required to indicate the salaries we pay to our employees, not what somebody else pays to them.

The CHAIRMAN. This table here should indicate part salary at least. It ought to give that information.

Mr. HARRISON. There isn't anything like that. All the cooperative salaries are entirely reasonable.

Mr. McLAUGHLIN of Michigan. Whether the law is a good one or not, that forbids a man to receive more than \$2,000 in the aggregate of combined salaries, it would seem to me that when he receives money out of that Smith-Lever fund after it reaches the State, that is pretty nearly Federal money, and the receipt of that contrary to that rule providing for the \$2,000 is an evasion of the law, in my judgment.

Mr. MCKINLEY. Mr. McLaughlin, isn't it a fact that some of these county agents get as much as \$5,000 a year?

Mr. HARRISON. One or two of them get \$6,000, but the local authorities put up practically all the money.

Mr. MCKINLEY. And part of that money comes from the Lever fund.

Mr. McLAUGHLIN of Michigan. Lots of them don't get any pay from the Federal Treasury at all. I am talking about a man that is on the Federal roll.

Mr. MCKINLEY. But a part of them do get State aid. We are paying a man \$5,000 a year, while the Government is only paying \$1,200 out of it.

Mr. McLAUGHLIN of Michigan. That comes out of the Lever fund.

Mr. HARRISON. We pay a part of the salary of a number of county agents, Mr. McLaughlin, out of the extension funds provided in this bill.

The CHAIRMAN. The situation is this: This is Government money. We pay the money over to the colleges and they pay that money here.

Mr. MCKINLEY. You think the wording should be "part payment"?

The CHAIRMAN. We ought to have the information as to the salaries paid.

Mr. HARRISON. We shall be only too glad to give the committee all the information it desires about them.

The CHAIRMAN. We ought to write into the law just exactly what the salaries are. We will discuss that later, if you will furnish a list of the salaries paid, and other information on the subject.

Mr. ROMMEL. Yes, sir. And I wish to say before we pass this, Mr. Chairman, in fairness to the department, that this matter is handled something in this way: An extension director will say, "Here, I have \$1,200 that I can pay toward an animal husbandry specialist; how much can you add to that in order to enable us to get a good man? Can you add enough for us to get a man that we can hire for \$2,400?" Ordinarily we can.

The CHAIRMAN. They add \$1,200; where does the \$1,200 come from?

Mr. ROMMEL. It comes from State funds.

The CHAIRMAN. Where do the State funds come from?

Mr. ROMMEL. It comes from State funds.

The CHAIRMAN. But where do the State funds come from? They come from the Public Treasury, do they not?

Mr. ROMMEL. They may; they may not. None of these men that I am speaking about now, so far as I know, receive \$2,400. We had one man on the rolls last year that was receiving \$2,750, all of which we paid. Twenty-four hundred dollars is the usual maximum limit, and we are losing these men all the time. We are having resignations constantly from our force, and how are we going to hold them?

Mr. McLAUGHLIN of Michigan. I said that was an evasion of the law. I don't know that it is, but it is interesting to know it, that men carried on this roll, receiving different amounts of money, are also on State rolls, receiving some money; that they have a divided allegiance; and whether that is right or not, or profitable or not, I don't know, but that is the situation.

The CHAIRMAN. How many extension men have you? How many should be added to what we appropriate for for the States Relations Service?

Mr. ROMMEL. I can't tell you exactly. I will have to furnish that information after I have checked with the records. I think it is between 50 and 60.

(A statement regarding salaries of employees engaged cooperatively by the department and by States follows:)

Animal Husbandry Division.

COOPERATIVE EXTENSION EMPLOYEES.

State.	Name.	Salary, Bureau of Animal Industry.	Salary, State.	Increased compensation.	Total salary.	Appropriation.

¹ Resigned, effective Dec. 31, 1919.

Mr. ROMMEL. I will take up the items, if you wish, that call for increases in the estimates.

The first one of those items appears on page 51, under the note "A," and item of \$75,000 for encouraging live-stock production in the Great Plains region. That item was put in as an outgrowth of our experience in the drought of the past four years in the West, and the purpose of it is right along the lines of this extension matter that we have been discussing, to place live-stock experts on the extension staffs of the agricultural colleges of the plains States, in order to bring about a development of the farming in that region which will stabilize it. We have a number of experiment stations in that country at which a certain amount of work is being done of an experimental character relating to live stock.

The CHAIRMAN. Will you give the number of those?

Mr. ROMMEL. That is not my province. Dr. Taylor is here and can give you that exactly.

Mr. McLAUGHLIN of Michigan. What is that?

Mr. ROMMEL. Dry land and western irrigation agricultural stations—the number of stations. We have some live-stock experimental work at Huntley, Mont., at Belle Fourche, S. Dak., at Scotts Bluff, Nebr., and at Ardmore, S. Dak. Those are the only stations at which we are doing any experimental work. The number of dry-land stations—I will have to turn that over to Dr. Taylor.

Now, the farming situation in the Great Plains region, from the best study that we have been able to make of it—and I personally have been in pretty close touch with it for the last three years on account of the relief work necessitated by the western drought—the farming in the dry-land country will never be stable until it is based upon live stock. The man who goes out there and attempts to farm in that section without having live stock as his basis is going to be up against starvation sooner or later. That was true in Texas; it is true in Montana, and is true of any other strictly dry-farming region.

Mr. McLAUGHLIN of Michigan. I would think that two kinds of farming would go together.

Mr. ROMMEL. You would think so, but they have not yet done it. That is exactly what we hope to drive home to those people.

Mr. McLAUGHLIN of Michigan. It is a difficult proposition to maintain live stock unless the crops are sufficient to feed them.

Mr. ROMMEL. The crops can be grown for live-stock production. The average dry farmer has specialized on grain production, and when he faces a period of drought such as the Montana farmers have just come through, such as the Texas farmers went through in 1916, 1917, and 1918, if that man hasn't balanced his farming in such a way that live stock is the basis of it, he will have to move out or starve to death.

Mr. McLAUGHLIN of Michigan. He must make his crops to suit the live stock, then, partly?

Mr. ROMMEL. Quite so; partly. In other words, he has to have some form of income and some form of food other than that from grain production.

The CHAIRMAN. What do you suggest to the farmers there?

Mr. ROMMEL. My suggestion is that they start with a little bunch of cows that they can milk, so that they can have milk and butter, and cheese, possibly; that they have a little flock of chickens; that they try to get off of the farm enough to keep the family alive.

Now, in order to do that, they have to have feed stored up, Mr. Chairman, to cover the periods of scarcity. Fortunately, some of the Texas people are doing that right now. There are men in west Texas that put up a two years' supply of feed this year. The result is they can put by in the years of plenty a sufficient supply of feed to carry their live stock over the years of scarcity, and they won't have to sacrifice it. The farmers in Montana, on the other hand, many of them settled on their farms right in the face of this three years' drought, and they have never been able to put up any feed or grow enough to support their live stock. They were dependent entirely on their wheat, and when the drought came, and they didn't raise any wheat, they had nothing with which to keep their live stock, and they had to sacrifice it. Many of them had to move out.

The CHAIRMAN. Have you any suggestions as to increased production?

Mr. ROMMEL. Increased production?

The CHAIRMAN. Is it simply a storage proposition?

Mr. ROMMEL. It is very largely a storage proposition. It is also the proper relationship of the crops that are planted.

The CHAIRMAN. What do you suggest in the way of crops in those sections?

Mr. ROMMEL. In Montana one of the best crops that they grow there is good old-fashioned corn. That is one of the best crops for livestock.

The CHAIRMAN. Can they grow corn up there?

Mr. ROMMEL. They had it last year. It was not only cold, but it was dry, but many farmers had corn last year sufficient to produce a certain amount of forage, in spite of the drought. As you go further down you get into sections where they can raise the grain sorghums. Millet helps—anything that will grow will help. Sunflowers are one of the promising crops in Montana.

The CHAIRMAN. It takes moisture.

Mr. ROMMEL. They are growing them out there on the dry farms, and that is one of the most promising crops that they have. If there is sufficient moisture in the spring to bring them up, they will make some sort of forage. The great problem in that whole dry farming country is for a man to raise enough to live on.

Mr. McLAUGHLIN of Michigan. How many men have you had in Montana doing that kind of work?

Mr. ROMMEL. We haven't had any, I am sorry to say. We have no men in Montana. We had some men out there on the emergency work, moving live stock last summer, but they were only temporary. We have no men whatever on the live-stock extension work in the Great Plains.

Mr. McLAUGHLIN of Michigan. Haven't the States had some men there?

Mr. ROMMEL. The States have done a little work along that line—not very much.

The CHAIRMAN. How much land would be required for a family?

Mr. ROMMEL. That question is one that the classification board of the Geological Survey is trying to answer now in regard to the 640-acre grazing homesteads. I don't believe that anyone can answer that question. It may be, in some sections, 320 acres.

The CHAIRMAN. Generally speaking, in these sections where you have your stations?

Mr. ROMMEL. The average farms in those sections run around 320 acres.

The CHAIRMAN. How many head of cattle can be kept on the 320 acres?

Mr. ROMMEL. They don't keep any cattle on most dry farms in Montana. That is the trouble. I don't know that I can answer that question. I don't know that anybody could answer it.

The CHAIRMAN. Have you been experimenting with stock out there?

Mr. ROMMEL. We have in one place, at Ardmore, S. Dak. We are running experiments there to determine the carrying capacity of the range. We are running cattle in lots of various sizes, on pastures of various sizes, running one to 10 acres, one to 5 acres, one to 20 acres, and so forth.

The CHAIRMAN. You are getting away from the dry region when you speak about one head to the acre, aren't you?

Mr. ROMMEL. One head to the acre? I said one head to 10 acres, or one to 5, or one to 20. The carrying capacity of the range varies from one to 10 acres to one to 50 acres.

The CHAIRMAN. You mean it would require from 10 to 20 acres, then, for one head?

Mr. ROMMEL. That would be a pretty safe estimate; yes, sir—a pretty safe estimate to make.

The CHAIRMAN. That would be about 16 head to half a section of land.

Mr. ROMMEL. If those were cows they would be in pretty fair shape.

The CHAIRMAN. You contend that a family could live on that number of head, 16 head of cattle?

Mr. ROMMEL. They could keep from starving to death; yes, sir.

The CHAIRMAN. Would it not be better to educate them to get out of that country, rather than to stay there and starve to death?

Mr. MCKINLEY. Isn't that the country that Mr. Lane is going to put our soldiers into, that type of country?

Mr. ROMMEL. No; I wouldn't care to say that. Mr. Lane should answer that question.

Mr. McLAUGHLIN, of Michigan. I don't think he is.

Mr. ROMMEL. I wish, Mr. Chairman, you would not get the impression that I have any motive in this matter except to try to keep those people from starving where they are. I am not condoning anyone; I am not discussing the motives that took those people into that country; I am discussing the fact of their being there.

The CHAIRMAN. I have been through that country, I confess that I have great sympathy for them, and if there is any way of helping them I would be very glad to do it. A good many of our people have gone into that country, and unfortunately have not been able to get out; I have said a number of times that the Government is responsible in a way for them being out there, which is very unfortunate. Now, if there is something we can do for them, we want to do it, but if we are encouraging them to stay without assisting them, or simply assisting to keep them alive, it does not seem to me to be a very good proposition.

Mr. ROMMEL. I want to say right here, Mr. Chairman, that I am not encouraging them to stay there.

The CHAIRMAN. You may discover something that may be of some value to them some day.

Mr. ROMMEL. I want to tell you a story. I have been right in the homes of these people and I know what they are up against. I have seen them in Texas and I have seen them in Montana, and the things they told me last summer in Montana were enough to stir any man's soul. One fellow came to me and said this: "Mr. Rommel, when I came into this country I had \$6,000 in hard money. It is all gone. Now I am going to stick as long as I have my clothes." I looked that fellow in the eye, and I said, "By Jove, you are worth helping, if you will fight this thing out."

Mr. McLAUGHLIN, of Michigan. He was, if there was any prospect of success.

The CHAIRMAN. That is where the argument comes in, whether there is any prospect of success.

Mr. SMITH, of Idaho. Mr. Chairman, may I ask a question? I happen to represent a part of the country to which Mr. Rommel refers. Ten years ago the eastern part of Idaho was considered a desert, but under the systematic plan of farming they have been able up in that eastern part toward Yellowstone Park to raise anywhere from 10 to 40 bushels of wheat per acre, and it is simply a good demonstration of what is being accomplished by the scientific methods that have been worked out by the Department of Agriculture with reference to the western country which, as I say, in years gone by was considered a desert, but many of the people now are very prosperous. It is true that up in Montana they have had a great drought and the people are hard up, but it is no reason why they should abandon the country.

The CHAIRMAN. No; we should not abandon the whole country; but I believe that that country was intended for grazing rather than for farming. If there is some way of helping them I will be very glad to help them. I have been through that country. Nearly every year I go out there. As I said, I have a good deal of sympathy for the people out there.

Mr. JONES. Is that man still living?

Mr. ROMMEL. Yes; he is living, because the men in Montana in the banking business and in the mercantile business there are standing behind those people. They believe that the thing to do is to stand behind them and to see them through, and that if they can take a man that has that kind of spirit and carry him through they think he will ultimately be in a position to make a crop. That is what they are betting on, and the weather records indicate that they can expect rainfall next year. There is no case on record until this year where there were three dry years in succession in that north Montana country.

The CHAIRMAN. But in your opinion what can be done for them?

Mr. ROMMEL. My opinion is that we should go out there, study their problems, study their agriculture, and see if you can put their farming on a live-stock basis, because they are not going to make it go when they are simply trying to raise wheat. We know that.

The CHAIRMAN. What hopes have you of doing something for them in the way of increasing production?

Mr. ROMMEL. I have just the hope that we had for western Kansas, western Nebraska, and the western Dakotas. When I was a boy at home in Iowa, every year at Christmas time the good people in the churches got up a Christmas box of old clothes that we didn't need. They particularly asked for clothes for the children, shoes and overcoats and caps and things of that kind. And where did that stuff go? You remember just as well as I do, Mr. Chairman. It went out to Kansas, and if you want to insult a Kansas man to-day just remind him of something of that kind. Kansas farmers are not in distress to-day because they have learned how to handle the farming on those lands and get by and make a living. Now we will have to work the same thing out in Montana. The Montana people think they are going through it now, and you know what happened to the west Texas people. Look what Texas has to-day. They have never had such grass conditions in the history of the State as they have had this year; yet a year ago you could travel for miles in Texas and see no grass anywhere, any more than there is on this table.

The CHAIRMAN. They have had droughts there practically three years in succession.

Mr. ROMMEL. Yes; but it started to raining and snowing in Texas just about a year ago and is still at it.

The CHAIRMAN. You have hopes of improving conditions, then?

Mr. ROMMEL. Yes, sir; absolutely. We believe that it can be done with live stock as the basis, and we believe people that have the courage and nerve of those people are worthy of help.

The CHAIRMAN. There is no question but that they are worthy, but what can we do for them?

Mr. McLAUGHLIN of Michigan. We often find, however, help being asked from the Federal Government when they ought to be helped by their own people. Now, this occurs to me, that if you send a man out there he has to be there long enough to learn conditions and study the climate and soil and be there some considerable time. Aren't there people in the States there that could be engaged by the State, and who know those things now, who could go in there and do that work?

Mr. ROMMEL. I would not send a man out there that did not know the conditions. I would not engage any man but a man who did know the conditions in the State.

Mr. MCKINLEY. Your note here says this is to work in cooperation with the State.

Mr. ROMMEL. Exactly. Most of the State people out there have unquestionably helped. They helped in many ways that have not been particularly apparent. If the attitude of the bankers and the business men had been different from what it has been there would have been one string of failures after another all along the line of the Great Northern Railway in Montana.

Mr. HARRISON. Dr. Rommel, this is a regional problem and not merely a State problem.

Dr. ROMMEL. Exactly. It extends from the Canada border to the Mexican line, over the entire Great Plains region, the entire dry-farming area.

The next item, Mr. Chairman, in which there is an increase is a request for an increase of \$37,000 for studying problems of beef

production. At the present time we are studying problems of beef production at Beltsville, Md., Lewisburg, W. Va., Canton, Miss., and McNeill, Miss.; at Springdale, N. C.; at Manhattan, Kans.; at Jonesboro, Ark.; and Indian Town, Fla.

If this increase is granted it is proposed to consolidate the work that we have been doing at Beltsville on beef production and the work we are doing at Canton, Miss., at the branch experiment station at McNeill, Miss. That station has been conducted for some 17 years by the State of Mississippi for the study of agricultural problems in south Mississippi. At the request of the Mississippi experiment station we took that over last spring. We placed a man in charge who is responsible to us and who is responsible to the director of the Mississippi experiment station. We share 50-50 in the cost of managing that station. That is to say, we pay the salaries and wages and they pay the other expenses. They contribute nothing toward the salaries of the men in charge.

We plan to discontinue the work in beef production that we formerly did at Beltsville and the work formerly done at Canton, Miss., and carry on that work at McNeill, Miss. McNeill is on the main line of the Southern about 58 miles from New Orleans. It is in the upper edge of the cut over pine country, and this also will be a regional station. The work that will be done there will cover a very large portion of the coastal plain, extending from east Texas well over into Georgia. The data that is obtained at McNeill will be applicable to this territory, and I need hardly say here that one of the great problems in the development of the coastal plain is the question of the live stock problems pertaining to this development.

The station at McNeill, as I have remarked, was established some 17 years ago by the State of Mississippi. It was developed for the purpose of studying crop producing problems in that region and was begun before any serious attention was being paid to live stock problems anywhere in the South, and before any attention whatever was directed to the live stock possibilities of the coastal plain. The investigations of the animal husbandry division on beef production problems in the South began in 1904, and the proposed work at McNeill is an outgrowth of work previously done. Not long ago the State of Mississippi established an agricultural high school at Poplarville, about 12 miles from McNeill, and arranged to transfer the work the State had formerly done at McNeill to Poplarville. The authorities of the Mississippi Experiment Station suggested that they would like the department to join with them in cooperative live-stock investigations at the McNeill station. They proposed to turn in the station intact with all buildings, cattle, and sheep, if the department would put a competent man in charge, and take care of other salaries and wages. They also offered access to all records collected at the station during its existence. The property turned into the cooperation by the State was 1,140 acres of land, with cattle, sheep, an office building, a superintendent's cottage, laborers' cottages, barns, silo, and farm machinery. Much of the property is already under fence. The department's agreement with the State specifically provides that it "does not in any way obligate the Department of Agriculture to the purchase or rental of land." The value of the State property turned into the project is conservatively estimated at

\$18,000. This offer was so generous and attractive, and enabled the department so to increase the efficiency of its experimental work, that it was accepted on February 21, 1919. The experimental beef production work which had formerly been done in Mississippi was conducted on a privately owned farm, which does not always give the opportunity for complete control of the work which is desirable.

The principal work of the station will be devoted to the study of problems underlying the development of the live stock farming and grazing possibilities of the coastal plain, using beef cattle principally, with sheep as an adjunct. Close cooperation will be maintained with the Bureau of Plant Industry in its forage investigations, and it is hoped that the bureau will find it possible to conduct experiments with pasture crops at the station.

During the present winter steers are being fed at McNeill to study the feeding value of velvet beans and the refuse of the sweet potato canneries. These steers are furnished by the Mississippi station for this work. Future studies will be planned to investigate the carrying capacity of native pastures, especially carpet grass, the effective establishment of carpet grass and other pastures on cut over lands, the feeding value of forage plants such as Japanese cane, Napier grass, Merker grass, etc. The department hopes that the station at McNeill may become known as a source of authoritative information on the live stock forage and pasture problems of a considerable portion of the coastal plain.

The CHAIRMAN. Is that a State station?

Mr. ROMMEL. It is a cooperative station.

The CHAIRMAN. What was it before you took it over?

Mr. ROMMEL. The title of the land is in the State. It was a branch station of the Mississippi Experiment Station.

The CHAIRMAN. Is that the experiment station of Mississippi?

Mr. ROMMEL. It is one of their branches; not the main station. We pay salaries and wages.

The CHAIRMAN. Before you took it over, what was it?

Mr. ROMMEL. They paid all the expenses then, so far as I know.

The CHAIRMAN. Out of funds contributed by the Federal Government?

Mr. ROMMEL. I don't know. I doubt that very much. I have always understood those Mississippi branch stations were maintained by State appropriations.

Mr. CANDLER. I think they are all maintained by State appropriations.

The CHAIRMAN. You have a State station there.

Mr. CANDLER. The station at McNeill was established by the State and by an appropriation made by the State at the time, and I presume it is kept up that way.

The CHAIRMAN. Operated independently of Federal funds?

Mr. CANDLER. It is operated, so far as I know, independent of Federal funds.

Mr. ROMMEL. That is my understanding, that it is operated entirely on State funds. My understanding is that the station at Starkville was the one that used Federal funds.

The CHAIRMAN. The funds contributed by Mississippi now, are they out of the funds contributed by the Federal Government?

Mr. ROMMEL. No, sir; they are out of State funds entirely.

Mr. CANDLER. The main station was at Starkville, Miss., at the Agricultural and Mechanical College. That is where the main agricultural station is located, and this is a branch station established by the State, and, of course, they get the information, I presume, through national channels, but they are supported by State appropriation.

The CHAIRMAN. Is this station a branch of that?

Mr. CANDLER. This first station I speak of, the main station, is located at the college and has been all the time.

The CHAIRMAN. It is being maintained there now?

Mr. CANDLER. Yes.

The CHAIRMAN. This is independent of that?

Mr. CANDLER. This is an independent station established by the State in the southern part of the State for the investigation of the peculiar conditions existing there.

The CHAIRMAN. This station, then, is similar to the one in Louisiana, a live stock station?

Mr. ROMMEL. Yes; somewhat.

The CHAIRMAN. Does that come under your jurisdiction?

Mr. ROMMEL. I am on the committee. A committee is in charge of that. Mr. Rawl, Dr. Taylor, Dean Dodson, and myself are on that committee.

The CHAIRMAN. Are all these stations in cooperation with the States?

Mr. ROMMEL. Yes, sir.

The CHAIRMAN. Do the States contribute funds toward their maintenance and operation?

Mr. ROMMEL. All of them.

The CHAIRMAN. To which do you refer?

Mr. ROMMEL. All this work is in cooperation with the States, except the one at Indian Town, Fla. That is independent of the State. The State is not contributing anything there.

The CHAIRMAN. Then it is similar to the work conducted by the stations at the colleges, is it not?

Mr. ROMMEL. It depends upon what you mean by "similar."

The CHAIRMAN. It is experimental work?

Mr. ROMMEL. Yes; it is experimental work. This is experimental work we are discussing now.

The CHAIRMAN. That is a function of the State station. What I was interested in knowing was if the work is being duplicated and if we are establishing two stations in each State.

Mr. ROMMEL. No; this work we are doing is not duplicating any work done by any State station.

The CHAIRMAN. By what authority were these State stations established?

Mr. ROMMEL. By the authority of an appropriation of Congress.

The CHAIRMAN. Was it a general appropriation?

Mr. ROMMEL. The appropriation for general expenses of the Bureau of Animal Industry, animal husbandry.

The CHAIRMAN. There was no specific appropriation made for this particular project?

Mr. ROMMEL. May I read you the language of the appropriation: "For all necessary expenses for investigations and experiments in

animal husbandry; for experiments in animal feeding and breeding, including cooperation with the State agricultural experiment stations," etc.

The CHAIRMAN. It is broad language. I know what the language is.

Mr. ROMMEL. That is the authority under which these stations were established.

The CHAIRMAN. According to that language, we have no check. You might purchase a whole county and put it all into one station, or go anywhere you might want to in the United States, or outside of the United States.

Mr. ROMMEL. That might be done, but it is not likely.

The CHAIRMAN. It has been customary heretofore, whenever you proposed to establish a new station, to bring the matter before Congress and get authority by Congress. I think most of these stations have been authorized by Congress.

Mr. ROMMEL. There has never been any authorization, Mr. Chairman, except that contained in that appropriation bill.

The CHAIRMAN. There was in Nebraska and a number of other stations.

Mr. McLAUGHLIN of Michigan. And the one in Louisiana.

The CHAIRMAN. One in Louisiana was authorized specifically.

Mr. HUTCHINSON. Doctor, I would like to ask you a question there. Is it necessary to have 4,000 ewes to experiment with? Is the Government going into the sheep-raising business?

Mr. ROMMEL. May I defer the answer to that question until we get through with this question of beef production? I will go into that in just a moment.

Mr. McLAUGHLIN of Michigan. I notice you are going to inaugurate a study of beef production in northern cut-over lands in Michigan, Wisconsin, and Minnesota. Whereabouts is that in Michigan?

Mr. ROMMEL. In the upper peninsula.

Mr. McLAUGHLIN of Michigan. What counties?

Mr. ROMMEL. The section that I have heard most about is the section around—I believe they call it Iron County, between Marquette and Menominee. That section came into the limelight last summer when we were moving cattle and sheep out of Montana. When the suggestion was first made that the department take hold of the relief work, the question of moving cattle into the northern Michigan and Wisconsin country was brought up, and somewhere around 200,000 to 300,000 head of cattle and sheep were taken in there. Some cattle had been going into the northern peninsula country for some little time. Arizona cattle, for example, had been going right along, but last summer northwestern stock went in on a wholesale scale.

Mr. McLAUGHLIN of Michigan. I know there were a great many sheep taken into Michigan; that there have been in the last two or three years.

The CHAIRMAN. A good many cattle went in, too.

Mr. McLAUGHLIN of Michigan. I did not know that they were put into the upper peninsula. Is this work to be in cooperation with the State college?

Mr. ROMMEL. The State experiment station; yes, sir.

Mr. McLAUGHLIN of Michigan. The State experiment station at Lansing?

Mr. ROMMEL. Yes, sir.

Mr. McLAUGHLIN of Michigan. Did they suggest it? Did the people at the college suggest it?

Mr. ROMMEL. Yes, sir; those people all through that section have asked for experimental work. The colleges of Michigan, Wisconsin, and Minnesota are all anxious to have investigational work, studying the questions of production in that territory.

Mr. McLAUGHLIN of Michigan. For the purpose of cooperation with you in Michigan next year, how much Michigan money will be available?

Mr. ROMMEL. The chances are there will not be very much Michigan money. The State of Michigan will probably provide the facilities, and they will probably expect the Government to furnish most of the funds, because ordinarily the States are not able to meet the department dollar for dollar. In a few cases they can, but that doesn't alter the fact that it is a cooperation with the State experiment station.

Mr. McLAUGHLIN of Michigan. That is one question that naturally arises—how much money is Michigan putting in? That would show Michigan's interest in it.

Mr. ROMMEL. I can answer that better if we were able to make a definite proposition to Michigan.

Mr. McLAUGHLIN of Michigan. Of course, I suppose Michigan is like all the rest of the States, willing to have the Government come in and spend all the money it pleases; but when a State itself is asked to put up money, it sometimes balks, and I would like to know whether Michigan has asked for this in such a way as to indicate its willingness to put up money.

Mr. ROMMEL. If you mean the Michigan experiment station, I will say we have no specific written request by the Michigan experiment station.

Mr. McLAUGHLIN of Michigan. Where does it come from?

Mr. ROMMEL. From the people in the upper peninsula.

The CHAIRMAN. Is it not a fact that you are encroaching upon the functions of the State and duplicating work done by these States?

Mr. ROMMEL. I hope not. I was not aware that there was any experimental beef production work being conducted in the Upper Peninsula of Michigan.

Mr. JONES. These people from the upper peninsula, did they make any effort to have the State take any active part in the work?

Mr. ROMMEL. I have not said and I am not aware that there was any experimental work in beef production. There is a station at Chatham, Mich., where they are doing some work with sheep and forage crops.

Mr. JONES. I understood you to say it was the people of the upper peninsula that were urging the Federal Government to take an active part in this work.

Mr. ROMMEL. Yes.

Mr. JONES. Do you know whether these same people made any effort to secure the interest of the State in this line of work?

Mr. ROMMEL. They have done something along that line, and they have this branch station at Chatham.

Mr. McLAUGHLIN of Michigan. Is that a branch of the station at Lansing?

Mr. ROMMEL. Yes.

Mr. McLAUGHLIN of Michigan. Under the same direction, is it?

Mr. ROMMEL. Yes. They have a local man in charge—a man, by the way, that they hired away from us.

Mr. McLAUGHLIN of Michigan. You speak of cooperation with the station in Michigan, but you furnish the money and the station furnishes the facilities. What do those facilities consist of?

Mr. ROMMEL. Land, buildings, animals, improvements.

Mr. McLAUGHLIN of Michigan. Have you seen this place yourself?

Mr. ROMMEL. Personally, I have not, I am sorry to say. I have not been through there. Several of our men went through there last summer, but I put in all my time in Montana.

Mr. McLAUGHLIN of Michigan. Are the buildings you speak of owned by the State?

Mr. ROMMEL. The buildings would be owned by the State; yes. The plant ought to be owned by the State.

Mr. McLAUGHLIN of Michigan. There are different kinds of land in the upper peninsula, some very fine land and some light cut-over lands. The fact is that the average yield per acre of crops in the Upper Peninsula of Michigan is higher than it is in the lower peninsula. They have got fine farming country up there, over a very large part of the upper peninsula. I did not know that they were asking Federal aid to carry on some experiments.

The CHAIRMAN. Is it necessary for the Federal Government to cover all this territory?

Mr. ROMMEL. The States are simply in this position, that they have got more demands for experimental work and extension work than they are able to meet with the funds at their command.

The CHAIRMAN. You have that direct from the stations?

Mr. ROMMEL. In many cases that is true.

The CHAIRMAN. You stated that you had no request from the college for the experiment station in Michigan?

Mr. ROMMEL. We have had no official request from the Michigan Experiment Station; no, sir; but we do know this, that the branch experiment station at Chatham, Mich., has not funds sufficient to study all the livestock problems in the upper peninsula.

Mr. HARRISON. Mr. Rommel, I think you ought to make it clear again that you are going to study regional problems, which are applicable not only to the Peninsula of Michigan but to other States as well.

Mr. ROMMEL. It applies also to northern Minnesota, and northern Wisconsin as well.

Mr. HARRISON. It has always been our policy not to study mere local problems within States.

The CHAIRMAN. Congress has made provision for permanent annual appropriations to the States, and no duplication or new stations should be established without the authorization of Congress.

Mr. ROMMEL. We appreciate that fact.

The CHAIRMAN. You appreciate it, but here is a case parallel with Mount Weather, with \$200,000 invested without the knowledge of

Congress or the committee. Here we find a new station without specific authority or knowledge of this committee or of Congress. I think Congress should authorize these stations specifically if they are made at all.

Mr. ROMMEL. I beg pardon, Mr. Chairman, but I feel that I ought to take exception to that remark, if I may. I have been coming before this committee for a good many years, and this is the first time that there has been any suggestion that I have been unfair in my testimony.

The CHAIRMAN. I spoke of the information given to the committee and the authorizations that have been made by Congress. The department should not undertake to establish stations without the specific authorization of Congress. Of course, if you take advantage of the broad language, you did have the authority. It has been customary to come before this Congress and tell the committee exactly what is desired and what it is proposed to do.

Mr. ROMMEL. I can only say that the wording of the item in the appropriation act gives full authority for the action we have taken.

The CHAIRMAN. Where are your estimates for these stations? Did you make any estimates last year? Did you advise the committee that you proposed to establish these stations?

Mr. ROMMEL. The question of the establishment of this station at McNeil, Miss., did not come up until after the 1st of January last. The matter went to the Secretary's office; the Secretary's office passed upon it with every supposition that the matter was being handled fairly. There was no attempt to cover up anything. As you probably know, Mr. Chairman, the regulations of the department and the laws of Congress are specific and definite, prohibiting subordinates in the department from approaching Members of Congress.

The CHAIRMAN. Congress was not advised.

Mr. ROMMEL. I am speaking individually. You have suggested here that I have been unfair to the committee, and I feel that in fairness to myself and to the department I should take exception to the statement.

The CHAIRMAN. It is the duty of the department to advise the committee fully.

Mr. McLAUGHLIN of Michigan. May I ask another question or two there? This general language under which you are operating, part of it is: "Including repairs and additions to and the erection of buildings absolutely necessary to carry on the experiments."

Do you propose to spend money to erect buildings at that station in the Upper Peninsula of Michigan?

Mr. ROMMEL. No, sir; the only thing that—

Mr. McLAUGHLIN of Michigan (interposing). Just another question: Do you think that you would have authority to use money for the erection of a building in that upper peninsula—a station?

Mr. ROMMEL. I do not. The Government has no authority to erect buildings on property not owned by the Government. We are erecting no buildings at McNeil, Miss. We don't own that land. That land is the property of the State, and any expenditures that we make will be in the nature of salaries and for maintenance. But buildings, permanent improvements, and things of that kind, are absolutely out of the question so far as the department funds are concerned on any institutions owned by the States.

Mr. CANDLER. You get the advantage there of the State's having already established the station, owning the land and having the buildings already erected, and you have the use of those buildings in making these investigations?

Mr. ROMMEL. Yes, sir. This clause that you have just quoted, Mr. McLaughlin, applies to stations in which the title vests in the United States; and I may say that we have endeavored not to abuse that privilege. We can give you an itemized statement at any time on request of every building that has been put up, the location, the cost, and everything—what it is used for, and so forth, if you desire to have it.

Mr. McLAUGHLIN of Michigan. Is it your purpose to buy stock with which to experiment at that station in the Upper Peninsula of Michigan?

Mr. ROMMEL. We try to get out of that too, for a very good reason. I will be frank with you, if we buy stock by and by we may sell it. Then we have to take the proceeds and turn them into the Treasury. We have to be constantly using department funds over and over. If the State owns the stock, on the other hand, they have a fund that they can use as a convertible fund if they want to.

Mr. McLAUGHLIN of Michigan. If the Government acquires it—if the State owns it, do you propose to buy stock with which to carry on experiments in the Upper Peninsula of Michigan?

Mr. ROMMEL. We do not.

Mr. JONES. Can you tell me why wealthy States like Wisconsin and Michigan and some of these Middle Atlantic and Eastern States are not interested enough in this proposition to make appropriations themselves for the development of their own State; and why the necessity arises that the Federal Government should go and do it?

Mr. ROMMEL. The probable answer to that question is that the areas in question are sparsely settled.

Mr. JONES. They are within the borders of the States?

Mr. ROMMEL. Yes; they are within the borders of the States; I grant you that. They are sparsely settled and there are not very many people, and for that reason there isn't a very strong popular demand in the State. It is a problem for future development of the territory.

Mr. JONES. Don't the same argument apply why the individuals from the thickly populated portions of those States should not have the same interest in the development of the whole State that the thickly populated parts of the United States should have in the thinly populated portions of the United States?

Mr. ROMMEL. That probably is about as broad as it is long. Theoretically I should say yes, you are quite right; practically, the fact remains that the demands for study looking toward the development of these large regional areas are largely the province of the department.

Mr. JONES. The history of these appropriations is that they are progressive. I presume that is a kind word to use, at least; they start with a nominal appropriation, and this one, which was \$42,000 in 1911, has gone up to over half a million dollars in 10 years. There must come a time when there is a stop to that, must there not?

Mr. ROMMEL. Yes, sir.

Mr. JONES. We can not go on that way indefinitely. When that time comes, the duty will devolve upon the State to continue it, will it not?

Mr. ROMMEL. Some suggestions have been made that where problems of this character cover more than the confines of one State, that the matter be a cooperative proposition between the Federal Government and the State; cooperative because the whole people are concerned, and also because that will in itself carry out the thought that you have in mind; it will operate as a check.

Mr. JONES. After all, it is a development of the State in its natural or created industry.

Mr. ROMMEL. Wherever it applies particularly to a State as a unit and does not go beyond the boundaries of that State, I do not believe that the Federal Government has any business to go in. If the problem is not regional, and does not apply to more than just one State, then it is purely a State problem.

Mr. JONES. There is certainly a benefit to the State in the development of these lands for cattle grazing or any other purpose.

Mr. ROMMEL. Yes, sir.

Mr. JONES. It is utilizing their waste lands, giving employment to men, creating better economic conditions in the State.

Mr. McLAUGHLIN of Michigan: Do you know of any problems in that portion of the Upper Peninsula of Michigan that are not present in other portions of Michigan?

Mr. ROMMEL. They have somewhat different problems there. Any problem in a section that is a cut-over section means different phases from those in open farming section.

Mr. McLAUGHLIN of Michigan. Michigan is all cut over. Michigan was largely a timber State from the Indiana line to Lake Superior. It was all cut over at one time, and while in the upper parts of Michigan there was a lot of pine land, much of which is pretty light soil, still there are full counties and great areas of the State that were hardwood timber, and the soil, almost without exception, is heavy soil and good soil. Large parts of it are not occupied, not cultivated, but it is cut-over land, and good land, and the problems of that part of the State, and that part of the State which is now more thickly settled are practically the same, and as the growth and the population of the State increases toward the north, it seems to me the problems are common all over that section of the country. I do not know what problems you could study that can not be studied anywhere in all parts of the State. I would be glad if you would tell me something that can not.

Mr. ROMMEL. The problem of winter maintenance is somewhat different. They have an entirely different method of seeding up there and getting their timothy and their clover pastures and meadows in. Their big problem up there, as I understand it, is to determine how they can utilize those lands without going to the necessity of clearing the stumps off at once.

Mr. McLAUGHLIN of Michigan. They have that problem all over the State. The man with a large part of his farm does not take out the stumps at once. He seeds a large field, and then later the stumps come out. And they have the advantage in the Upper Peninsula that the snow comes in great quantities there without

the ground freezing. Just as soon as the snow goes away in the spring they can plow and put in their crops; whereas in the southern part of Michigan, a large part of the Southern Peninsula, the ground freezes hard first and then the snow comes. When the snow leaves in the spring they have to wait for weeks until the frost gets out of the ground. The Upper Peninsula has the advantage in that respect. I don't know what problems you are going to study there that are not common to a large part of Michigan.

Mr. ROMMEL. Of course, I can answer your question in regard to that specifically and more intelligently if I had made a closer personal inspection of that land. The presence of a long winter season, with snow on the ground through all the winter is a problem of considerable importance to answer. There isn't any question, so far as I can find out, but that they can graze animals satisfactorily there during the growing season, the five months that they have pasture available, when crops are growing; but for the other six or seven months they have a problem of winter maintenance that I think is extremely important. In other words, what shall be the method of handling live stock in that country? Shall they take live stock in there from the West or from the Southwest solely for grazing through the summer time, or can you develop a permanent live-stock industry in that country by growing during the growing season feed enough to carry the animals through the wintertime.

Mr. McLAUGHLIN of Michigan. That problem is exactly the same all over Michigan. The winter season is a little longer in the Upper Peninsula, a little bit longer as you go north, but it is the same thing except as to length.

Mr. ROMMEL. You might make the same remark in regard to the problem of winter maintenance in Mississippi, for instance, where they only have about two or three months of winter.

Mr. McLAUGHLIN of Michigan. I don't know anything about Mississippi.

Mr. HUTCHINSON. You said that the experiment station did not ask for this assistance, did you not?

Mr. ROMMEL. We have no specific formal request from them.

Mr. HUTCHINSON. Did you have any from the farmers up there?

Mr. ROMMEL. From the farmers and landowners in the Upper Peninsula.

Mr. HUTCHINSON. A number of them or one or two?

Mr. ROMMEL. Yes, sir; there are a number of organized bodies up there that have made the request. A number of farmers have made the request—landowners and people of that kind; the Upper Peninsula Development Bureau—people of that sort—are the ones that are anxious to have this work carried on.

The CHAIRMAN. What do you propose to do at Beltsville after you abandon that station?

Mr. ROMMEL. I did not intend to give the impression that we were going to abandon Beltsville.

The CHAIRMAN. The particular activity that you have been carrying on there will be abandoned?

Mr. ROMMEL. The beef-cattle work that we have been carrying on there during the past two seasons at Beltsville will be carried on at

McNeil, Miss. We haven't room at Beltsville to conduct beef-cattle work.

The CHAIRMAN. What is the character of your activities at Beltsville?

Mr. ROMMEL. The work will be confined to sheep, hogs, goats, and poultry, with a little work on work horses in addition.

The CHAIRMAN. Can it not be better conducted in one place, under one roof and under one management? Could it not be carried on more economically and more successfully in that way?

Mr. ROMMEL. Yes; more economically; and then you would not be able to study these regional problems. You could not get the advantage at a place like Beltsville of the environment such as you have in the far West, for example.

The CHAIRMAN. Why?

Mr. ROMMEL. Because the climate is different, the rainfall is different, the soil is different—a thousand and one things are different.

The CHAIRMAN. It is largely a feed proposition, is it not?

Mr. ROMMEL. Surely; influenced tremendously by the crops that you can grow, the soil you have, and the rainfall you have.

The CHAIRMAN. Do you contend that you get a bigger gain with corn grown in Michigan than with corn grown in Maryland?

Mr. ROMMEL. It is not alone the gains from feeding corn.

The CHAIRMAN. If you feed corn, hay, or anything else.

Mr. ROMMEL. But you can get different returns from pastures of different kinds. If your corn analyzes the same, which is not at all likely—corn varies in analysis—but given the same analysis, you will get similar results under similar conditions; but you can not grow blue grass in Mississippi; you can not grow carpet grass at Beltsville.

The CHAIRMAN. I suppose we know that without going to Mississippi to investigate it. That is common knowledge.

Mr. RUBEY. If you are looking for a good place to go, come down into the Ozark Mountains of southern Missouri and we will find you a good place for any kind of experimentation you want. [Laughter.]

Mr. JONES. Or, in the absence of Mr. Tincher, I will suggest Kansas.

Mr. CANDLER. I suggest that McNeil, Miss., is a splendid place.

Mr. ROMMEL. The next item is the item for the increase in Idaho at the United States sheep experiment station. The department estimate for this increase is \$82,290. That station was established in 1915 by Executive order. Twenty-eight thousand acres of land were withdrawn in what was then Fremont County, Idaho, and is now Clark County, Idaho. The experimental flock which had been carried since 1906 near Laramie, Wyo., was transferred to this new location. Since then we have been equipping it as funds were provided, and the work has gone far enough now where we are making a formal request for an enlargement of the work, so that it will be representative of range conditions.

Of this amount of \$82,290, the department is asking for \$45,000 for the purchase of hay land. Our expenditures for hay with a flock the size that we believe is necessary will be in the neighborhood of \$20,000. If we have hay land provided, we will in the course of time, say after about three years, be able to raise most or all of the hay that we need and a considerable portion of the grain. At the present

time we have to buy all the hay, because this land that we have is strictly grazing land, always has been, and it always will be.

The CHAIRMAN. Do you propose to drive the sheep to the hay land, or what?

Mr. ROMMEL. We will drive the sheep to the hay land.

The CHAIRMAN. How far would you have to drive them?

Mr. ROMMEL. About 40 miles. We hope to be able to get a ranch within about 40 miles.

The CHAIRMAN. Irrigated?

Mr. ROMMEL. Yes. The remainder of the appropriation is for buildings, for the construction of fences, and for the increase in expenses for feed and labor. Also we are asking for \$600 for the purchase of an automobile for the superintendent.

Mr. JONES. Where can you get an automobile for \$600?

Mr. ROMMEL. A Ford, I believe, can be purchased for that amount.

Would the committee be interested in some photographs of that station, Mr. Chairman?

The CHAIRMAN. You might show them.

Mr. ROMMEL. This first photograph [exhibiting photograph] illustrates the headquarters. This building here is used for three purposes: The superintendent has his residence in the corner; the next two windows are the office; the next window is where the cook lives; and at the end here is the mess hall. The next building is the ice house; the next building the pump house; and the building off in the corner is the bunk house for the men. This building [indicating] is the lambing shed.

This photograph [indicating] shows the main reservoir. It will hold about 15,000 gallons of water. That was what made the station possible. This land had never been used except for a few weeks in the spring and a few weeks in the fall, because there was no water on it. It is good grazing land but no one had ever gotten any water there, except one little corner where a ditch had been carried across. It is too high to be irrigated, but our men went at the job and put in a well, and we have at 750 feet a splendid flow of water, and the water outfit cost us right around \$9,700 complete.

This picture [indicating] shows the men digging a trench from the reservoir down to the buildings. The ditch goes almost all the way through lava rock and is extremely hard digging. We had to put pipes down four and a half feet to get below frost. Now we could, if we wanted to, deliver water from that reservoir by gravity over practically half of the ranch, but the expense of digging trenches makes that out of the question, so we have installed small auxiliary tanks out on the range 3 miles apart and 3 miles from the main reservoir. We find that we can haul water to those tanks and keep them filled and keep the sheep supplied. Those tanks hold about 7,500 gallons and the trough holds 1,500 gallons.

This is a picture of the flock in winter on the range [indicating]. The thermometer was 35° below zero when that was taken. During the summer the main portion of the flock is run on Targhee Forest, which is about 12 miles away from headquarters. We get the same sort of arrangements there that any private flock owner has to meet.

Mr. MCKINLEY. About how many sheep have you?

Mr. ROMMEL. We are carrying about 1,200 ewes now. What we hope to do when this work is properly developed is to have 4,000 ewes so that we can have several bands of sheep. The thought in mind is that if we are conducting our experimental work with full-sized commercial bands of sheep, we are then studying the problems of the flock as they confront the sheepman. We have already worked out two problems that are of importance. The first one is the relationship between length of fiber and coarseness of fleece or fineness of fleece, whichever way you wish to put it. The western men have always insisted that a fleece should be extremely fine, because in that way we get the weight, but we find that by selecting for length of fleece we get just as heavy a fleece, but we get a somewhat coarser fleece, which, however, is more in demand in the market than the extremely fine one.

Similarly we have studied the problem of the relationship between the covering of the face and the weight of the fleece. A sheep with a heavily woolled face, is objectionable on the range because it can't see and often becomes blinded in winter. We have found that we can get practically as good results in yield of wool from an open-faced sheep as from a close-faced sheep.

Mr. CANDLER. What variety of sheep did you experiment with?

Mr. ROMMEL. The main part of the farm flock is Rambouillet. Then we have the Corriedales, imported in 1914 on authorization of Congress. Since 1913 we have been developing a strain of Lincoln on Rambouillet, and that, apparently, is going to answer the question that was presented to us when this work was started nearly 15 years ago. Sheep men say that apparently, in this Lincoln-Rambouillet sheep, we have the breed for the western range.

The CHAIRMAN. How much have you invested in Idaho, altogether?

Mr. ROMMEL. Do you mean, permanently?

The CHAIRMAN. Yes.

Mr. ROMMEL. The expenditures for permanent improvements in Idaho, to date, including equipment, such as the lighting plant, the work on the roads, fencing, wagons, farm machinery, etc., is \$31,200.

The CHAIRMAN. You have to construct new buildings on the hay land?

Mr. ROMMEL. No; we hope to get a ranch with buildings already on it. The additional buildings that are called for here are a horse barn, an addition to the lambing shed, a granary for storage, and a cottage for one of the men.

The CHAIRMAN. On the land to be purchased?

Mr. ROMMEL. Right in connection with this station here. At present this building here [indicating] is not only the lambing shed but it is the horse stable, the warehouse, the shearing shed, and the machinery shed. We hope to add to it somewhat, and get the horses and the grain out of there.

The CHAIRMAN. What is the prevailing price of hay land there?

Mr. ROMMEL. It will cost somewhere around \$200 an acre. We estimate we will get in the neighborhood of 225 acres for \$45,000.

Mr. SMITH of Idaho. That includes the permanent water rights too?

Mr. ROMMEL. Yes; we want one with a permanent water right. We could not afford to go anywhere except with that.

Mr. JACOWAY. What will it cost a ton to put up this hay?

Mr. ROMMEL. It will not cost more than \$8 or \$10, at the very outside.

Mr. JACOWAY. What have you been paying for it?

Mr. ROMMEL. We got our hay at \$15 in the stack this year. We were very fortunate that we got in before the raise. We bought a little at \$18, but most of our hay we got at \$15 a ton in the stack, 512 cubic-foot measurement.

Mr. JACOWAY. What is the object you have been driving at in all this 15 years in the work out there? What is the thing you want to accomplish? How near are you to accomplishing it?

Mr. ROMMEL. The first thing we wanted to see whether it was possible to develop a breed of sheep that was in itself satisfactory for range purposes. The average western ranchman, before we got into this work, never followed any specific line of breeding. For instance, he would have a fine-wooled band of ewes and breed them to long-wool bucks. Then by-and-by he might go back to the fine-wool breed; then he would have, possibly, what we call his lamb band, the ewes in which would be bred to black-face bucks.

Mr. JACOWAY. Then, from this you have got a standard breed that will thrive in that country?

Mr. ROMMEL. That is the first thing we set out to do, and apparently we have it in the Lincoln-Rambouillet cross.

Mr. JACOWAY. Will that breed of sheep do for the South?

Mr. ROMMEL. I am beginning to think that it will. That is one of the questions that I hope to see answered in the next few years. I am beginning to think that possibly not this cross-breed variety that we have in Idaho, but a sheep with some of that blood in him, may be satisfactory under southern conditions.

Mr. JACOWAY. In the South we have got land that has got all the water on it you want, that will raise all the hay that you want, cut-over land that can be gotten for from \$3 to \$5 an acre; and it is your opinion, then, after studying this, that the sheep business can be made profitable in the South like it is out there, and the same breed of sheep can be used?

Mr. ROMMEL. A similar grade of sheep. There are problems of the sheep industry in the South peculiar to that section. There are sheep all over the South, you know. You find them everywhere. You find them in your country, Mr. Candler, in Mississippi.

Mr. JACOWAY. There are as many different kinds of sheep as there are farms on which sheep are raised.

Mr. SMITH of Idaho. May I ask a question? What proportion of the appropriation of last year, or the previous year, has been returned? That is, what proportion of the appropriation has been earned by reason of the conduct of these experiments?

Mr. ROMMEL. That is increasing every year. The amount that will be returned this year into the Treasury will be, as near as we can approximate now, \$13,000.

Mr. SMITH of Idaho. And the appropriation was only \$20,000 last year?

Mr. ROMMEL. \$20,720.

Mr. SMITH of Idaho. And if this appropriation is granted and experiments are conducted as you plan, with the enlargement of the plant, and so forth, will that proportion of return likely increase?

Mr. ROMMEL. Oh, yes.

Mr. SMITH of Idaho. And the station in a few years will be made self-sustaining?

Mr. ROMMEL. I would not care to promise that the station will be made self-sustaining, but in some years it probably will be. We expect that the revenue from this station will, if it is carried on this basis that we have recommended, amount to not far from \$30,000 a year.

Mr. SMITH of Idaho. Do I understand that you dispose of these sheep after you breed them up?

Mr. ROMMEL. Yes, sir.

Mr. SMITH of Idaho. You dispose of them to the farmers around in that particular section of the country?

Mr. ROMMEL. We put into the sales at Salt Lake, under the National Woolgrowers' Association, some of the choicest ones, especially ones that we want people to see, you know, to see what we are doing. Others are sold to farmers and ranchmen.

Mr. SMITH of Idaho. So, under your plan, the stockmen, the sheepmen all over the western country, get the benefit of your experiments?

Mr. ROMMEL. Yes, sir; the work at this station applies to a very large area of territory: Idaho, Wyoming, Montana, Nevada, Utah, and Colorado, and to a considerable extent to Washington, Oregon, California, Arizona, New Mexico, and Texas.

Mr. JACOWAY. How many sheep can you support on an acre of ground?

Mr. ROMMEL. In that section it takes several acres.

Mr. JACOWAY. How many?

Mr. ROMMEL. We are going to run about 4,000 ewes, if Congress gives us sufficient appropriations. We have 28,000 acres of land. That is about 1 ewe to about 7 acres.

Mr. RUBEY. Are you having any trouble out there from the depredations of animals among the sheep?

Mr. ROMMEL. We are not, yet, because we watch them very carefully. One of the items that we propose to put in with this appropriation will be the construction of coyote-proof fences, and then we will exterminate any coyotes that may be inside of those fences. The fences will be built so that coyotes and wolves can not get through.

Mr. RUBEY. Can you manufacture a fence that a dog won't get through? If you can, we raise some sheep in my country, and we would like to know about it.

Mr. ROMMEL. A dog can't go through a coyote-proof fence. In building a fence, if you will put a barbed wire, stretched tight, on the ground, and then to make insurance doubly sure put another one on the other side of the post, right on the ground, and then start with 36 inches or 3½ feet of woven wire, not more than 6-inch mesh, and have the bottom of that wire not more than 3 inches from the ground, put a couple of strands of barbed wire on top of that, and keep the holes underneath filled up, no dog will go through or over.

Mr. RUBEY. That is the great difficulty we have in the South—the dogs.

Mr. HUTCHINSON. Doctor, I want to renew my question now as to why it is necessary to have a plant like this; why it is necessary for the Government to have a plant as large as this?

Mr. ROMMEL. I am glad you asked that question. The reason for it is that we want the conditions under which we are doing this experimental work to match up as closely as they can with the work that the ranchmen, our neighbors, are doing. We want a ranchman to go to that station and know that the problems that we are meeting there are the problems that he meets every day in his business; if he has a band of sheep over here in the hills, or half a dozen bands of sheep, we want to be able to take him to a band of sheep, and not merely a few head. Take, for example, these cross-breeds that I spoke of, we want to show him that here is a successful band of those sheep all of which are bred in the same way. We want each band of sheep used to demonstrate one problem that we are studying. On the basis recommended we will be able to handle at least four bands, counting 1,000 ewes in each band.

Mr. HUTCHINSON. Do you have different breeds?

Mr. ROMMEL. We have several breeds—Rambouillets, which are practically pure bred; the Corriedale sheep, which were brought from New Zealand; and these crossbred sheep, the Lincoln on Rambouillet; as well as some crosses from Corriedale and long-wool breeds besides Lincolns.

Mr. ANDERSON. How far is this station from the railroad?

Mr. ROMMEL. It is 6 miles from the railroad station. The main line of the railroad from Salt Lake to Butte runs right along the western edge of the station.

The CHAIRMAN. Do you wish to say more, Mr. Smith?

Mr. SMITH of Idaho. I just wanted to have the privilege of having inserted in the record, following Dr. Rommel's testimony with reference to this experiment station, a statement that I have.

The CHAIRMAN. Do you desire to read it?

Mr. SMITH of Idaho. I don't want to take the time of the committee to read it, but I would like to have it go in the record, if I may.

The CHAIRMAN. Without objection, it will be inserted.

(The paper referred to follows:)

THE STATUS AND WORK OF THE UNITED STATES SHEEP EXPERIMENT STATION.

The United States sheep-experiment station is located at Dubois, Clarke County, Idaho. It was established by Executive order No. 2268, dated October 30, 1915, withdrawing from settlement 28,160 acres of nonagricultural public land, to be used "as a sheep breeding and grazing experimental station." The Agricultural appropriation acts for the years ending June 30, 1918, 1919, and 1920 provided \$20,720 per year for the equipment and maintenance of this station. The experimental flock now numbers 1,200 breeding ewes, in addition to lambs and rams.

The equipment and improvements placed upon the station's land consist of five buildings, a deep-well watering system, fences, roads, work stock, etc., representing a total outlay since July 1, 1917, of \$31,493.

OBJECTS OF THE SHEEP EXPERIMENT STATION'S WORK.

From 1906 to 1917 the Bureau of Animal Industry maintained a small flock for experiments in breeding range sheep. This flock was kept at relatively heavy expense on a privately owned ranch at Laramie, Wyo. In order to attempt the solution of some of the range problems in a practical and satisfactory way it was found necessary to use larger numbers of sheep, and to have them and the range upon which they grazed under the full control of the bureau at all times.

This station at Dubois was established for the investigation, in an experimental way, of questions affecting the production of wool, lamb, and mutton on

the ranges in Idaho, Wyoming, Montana, Nevada, Utah, and Colorado. This work is also considered to be of value, though less directly, to the sheep raisers of Washington, Oregon, California, Arizona, New Mexico, and Texas. These 12 States have 27,224,000 of the 49,863,000 sheep in the United States on January 1, 1919.

The 11 range States (Texas excluded) contain 211,277,000 acres of unreserved unappropriated public land in addition to 130,184,700 acres in national forests. On by far the larger part of these remaining public lands, as well as upon a great deal of privately owned land, the grazing industry will remain paramount. The utilization of these lands in the most scientific way and with the most useful types of animals is vital to the range States themselves, but also vital to the production of food and clothing for the entire country.

There is no other station in these 11 range and public-land States having facilities for conducting experiments in range sheep production. A large area was needed to permit handling of a number of bands (1,000 to 1,800 head) of range sheep under different methods to show the most economical ways of utilizing the range and of breeding and handling the sheep.

PLAN OF STATION'S WORK.

The experiments have been planned and so far as facilities allow are being conducted under four main heads, as follows:

1. Methods of grazing the range to secure greatest returns.
2. Methods of handling and feeding range sheep for maximum quantity and quality of lambs and wool.
3. Types of sheep for the range.
4. Systems of handling sheep on stock-raising homesteads.

Methods of grazing the range to secure greatest returns.—Experiments under this head will be started as soon as a larger number of sheep are available and sufficient fencing can be erected to insure complete control of the range used.

The feed-producing capacity of a large part of the range area has been seriously impaired by overstocking and by lack of a rotation of grazing times to permit reseeding of the grasses. The sheep experiment station's work in this field will be planned to show (1) the acreage required per 1,000 head at a reasonable rate of stocking and when overstocked; (2) the gain in feed production per section of land from observing a rotation of grazing periods to permit reseeding; (3) the extra cost and extra returns of keeping range sheep in fenced areas as compared to herding on the range; (4) to afford a fair measure of the number of sheep that can be supported on a section of such land as is controlled by the station.

Methods of handling and feeding range sheep for maximum returns.—Studies along this line are now in progress. They include (1) size of lamb crop as affected by number of rams and care of rams, time of breeding, condition of ewes, methods of lambing; (2) amount and kinds of feed for winter feeding with greatest economy and to produce largest yields of wool and lambs.

Types of sheep for the range.—Up to the present the experiments conducted have related chiefly to this branch of the work. High-grade Rambouillet stock has been used from the start. In 1915 a flock of Corriedale sheep was imported from New Zealand under provisions of the Agricultural appropriation act for the year 1914-15. In 1913 experiments in cross-breeding were begun.

This branch of the work also includes a study of various types of individuals within the Rambouillet breed, with reference to face covering, skin folds, and length and fineness of wool as they affect the weight and value of fleece.

The results of these experiments are now being prepared for publication. Brief presentations of some of the phases of this part of the investigation are contained in the succeeding pages.

Systems of handling sheep on stock-raising homesteads.—The plan of work provides for fencing of separate sections for study of methods of management and the kind of sheep that may be used to secure greatest net returns from the keeping of sheep on stock-raising homestead lands.

PARTIAL SUMMARY OF WORK ON "TYPES OF SHEEP FOR THE RANGE," CONDUCTED AS PART OF "RANGE SHEEP INVESTIGATIONS," AT THE UNITED STATES SHEEP EXPERIMENT STATION, DUBOIS, IDAHO.

BREEDING FINE-WOOL SHEEP.

A. *Face covering.*—In breeding sheep with production of fine wool as the chief aim, breeders have generally produced a sheep with a face closely woolled up. This feature has been objected to by some ranchmen, but it has been held

that the fleece weight would decline if the wool was bred off the faces. The bureau's records prove that it is possible to have the advantage of an open face without losing in weight of wool.

Year.	Open-faced sheep.			Closed-faced sheep.		
	Num-ber.	Average weight fleece.	Average weight fleece.	Num-ber.	Average weight fleece.	Average weight fleece.
1916.....	115	Pounds. 12.14	88	104	Pounds. 11.08	Pounds. 80.25
1917.....	127	9	77	54	8.6	68
1918.....	116	10.6	79	36	11.8	74

¹ Yearlings; weights given are for first fleeces.

B. *Length and fineness of fleece.*—Breeders of fine wool sheep, which until recently predominated on the range, have always emphasized weight of fleece and fineness of fiber. The bureau's data show that money returns can be better increased by selecting for longer wool even though it is less fine. By increasing length the weight and pound value of the fleece are both added to. The longer fleeces are shown to be ordinarily a little less fine, but this is associated with greater size and vitality.

Below are shown the weights of wool obtained from sheep of varying fleece weights over a period of eight years:

Length of wool.	Average weight of fleece.	Number fleeces.
1.5 inches or less.....	Pounds. 9.8	29
1.5 inches to 2 inches.....	10.2	505
2 inches to 2.5 inches.....	11.3	1,030
2.5 inches to 3 inches.....	11.7	369
Over 3 inches.....	11.9	65

The fact that increased length is associated with coarser fiber is shown in the table below. These results show that in breeding for length it is well to select for 56s or 58s wool. The data on hand also show that with the somewhat coarser wool there is better character. The fineness is shown in "counts," 56s representing commercial wool of the half-blood grade, and the higher counts the higher grades.

Length of fleeces of varying fineness as shown.

Year.	56s.	58s.	60s.	62s.	64s.
1915.					
Average length.....inches..	2.5	2.35	2.3	2.4	2.3

Types of sheep for the range.—Since 1913 range sheep men outside of the Southwest have been forced to breed along new lines to produce both wool

and mutton. The system of crossing back and forth with long wool and fine wool rams has many drawbacks. The type of sheep secured from the first cross of long-wool rams upon fine-wool ewes has produced a satisfactory sheep, but it was not considered possible to breed in such a way as to retain this type.

The bureau's experiments with breeding Lincoln-Rambouillet crossbreds strictly within themselves has produced a sheep which ranchmen have pronounced to be what is needed. This experiment has also demonstrated the system of breeding to be followed in producing such a sheep.

Corriedale sheep were imported from New Zealand in 1914 as a part of the study of the same problem. They have been found to be quite well adapted to Wyoming and Idaho ranges.

Records on a few points of these two types of sheep are presented along with similar figures for grade Rambouillets kept in the same flock.

Year.	Lincoln-Rambouillet crossbreds.				Corriedales.				Rambouillets.			
	Number ewes bred.	Per cent ewes lambed.	Average weight fleece.	Average weight yearling ewes.	Number ewes bred.	Per cent ewes lambed.	Average weight fleece.	Average weight yearling ewes.	Number ewes bred.	Per cent ewes lambed.	Average weight fleece.	Average weight yearling ewes.
1916.....	50	88	13	102	64	92	10.2	-----	537	85	11.89	82

ESTIMATES OF APPROPRIATIONS FOR RANGE-SHEEP INVESTIGATIONS.

An increase of \$82,280 in the appropriation for "Range-sheep investigations" is included in "the estimates of appropriations for the Department of Agriculture for the year ending June 30, 1921" (p. 52), as submitted to the second session of the Sixty-sixth Congress.

The department's work in range-sheep investigations is conducted at the United States sheep experiment station, located at Dubois, Idaho. A brief outline of the work of this station and the plans for making it of greatest service accompanies this report.

The increases estimated are for three main purposes:

Purchase of land to raise winter feed.....	\$45,000
Feed, labor, and salary.....	¹ 22,500
Completing equipment for experimental work.....	¹ 14,780

The present allotment for this project is \$20,720. With the above increases for 1921 the total outlay would be \$103,000. The annual expenditures for succeeding years, if the increases are received, would be in the neighborhood of \$35,000, with a return to the Treasury that in some years would equal that amount.

EXPLANATIONS AND DETAILS OF INCREASE.

Purchase of land to raise winter feed.—The land used by the sheep experiment station has no irrigation water and produces no harvested crops for winter feeding. In 1919, \$10,000 was paid for hay (400 tons at \$17 per ton) and grain for the 1,200 ewe flock and the work stock. On the basis of a 4,000 ewe flock, which it is desired to keep, from 900 to 1,000 tons would be needed each winter. This amount of hay could be produced on 300 acres of land, which would cost not less than \$150 per acre. There would be the expense of labor on the hay ranch and water fees, as compared to paying from \$15 to \$22 per ton, as has been necessary during recent years. The saving in feed bills, at present rates, would pay for the land in five years.

¹ Owing to an error these items are slightly different from those shown in the estimates. The totals are the same.

Feed, labor, and salary.—The increases estimated under this head are for use as follows:

Hay	\$13, 000
Labor	5, 000
Grain	2, 500
Salary	2, 000
Total	22, 500

Of the above the item for increased expenditure for hay would be unnecessary after the first crop had been secured from the land purchased.

These items are intended to allow keeping a 4,000 ewe flock, which is desirable to carry on the experiments along practical lines that will be representative of the general ranchman's conditions, and in the most economical way. Sheep ranchmen would not put into practice results of experiments in grazing in which a small number of sheep were used to a lot. Such results would not necessarily hold true under general range conditions.

One herder can attend to 1,000 sheep on the range as well as to a smaller number. As the winter feed is all that is paid for, the expense of 4,000 sheep, aside from feed, would be less than double that for 1,200 at present.

In 1920, 400 tons of hay were purchased for \$7,000. For the larger flock 1,000 tons would be needed. At the very probable rate of \$20 per ton this would require \$20,000, or an increase of \$13,000.

Three additional full-time men would be needed and two part-time men. The ruling rate of wages in the vicinity of the station is now \$100 per month and board.

It is desired to provide for a second man who can assist and substitute for the superintendent at the station and in educational work in cooperation with the State extension departments and in field studies of sheep breeding.

An income of \$19,000 received from the sale of wool and sheep will be converted into the Treasury during 1919-20. Even with lower prices in the future, with a larger flock the returns should exceed this by a considerable amount.

Completing equipment for experimental work.—The following buildings and equipment are necessary with the present-sized flock:

One residence for assistant to superintendent	\$4, 000
One horse and hay barn, addition to lambing shed	3, 000
Grain storage	1, 000
Automobile for superintendent's use	600
Fencing experimental pastures	4, 000
Water lines, hay ranch tools, and machinery	2, 000

One or all of the first three items could be located upon the hay-producing land, but if not, would be needed at the present headquarters.

The fencing and stock-watering facilities are needed for the grazing experiments and for utilization of the present grazing lands.

The CHAIRMAN. Tell us of the \$5,000 increase at Beltsville.

MR. ROMMEL. That request for \$5,000 increase at Beltsville, Mr. Chairman, is to take care of increased expenses at the station. We have had no increase in the appropriation for the maintenance of the farm at Beltsville for several years. We have had some slight increases for the experimental work that has been done there, but nothing whatever to pay for the strictly farm work itself.

The CHAIRMAN. I understand you are going to abandon some of the work there?

MR. ROMMEL. That work is one of the very small items of the farm.

The CHAIRMAN. You are going to extend the other activities?

MR. ROMMEL. Yes; we want to meet expenses as they ought to be met. We have been compelled to draw on other projects in order to meet expenses that ought to be charged strictly to the experi-

mental farm at Beltsville. And that is the real reason for asking for this increase for miscellaneous supplies. It is the high cost of living in handling an experiment station of that nature. That is exactly what it is, in a word.

Mr. JACOWAY. As you develop this breed of sheep, and everyone knows it is a success, what is the object then of continuing the station?

Mr. ROMMEL. That is the first one of our problems that we have worked out there. There are four main problems at that station. The first one is the study of methods of grading to secure the greatest returns. The second is the study of methods of handling and feeding range sheep for maximum quality and quantity of lambs and wool. Third is the question of the types of sheep for the range, which we have partly answered; and fourth, the system of handling sheep on stock-raising homesteads.

There are four problems that will keep anybody busy for a good long time. We have not answered all the questions. We think we have made an approach to answering this one question.

Mr. HUTCHINSON. Doctor, in case we give these increased appropriations, with all these experiments, do you think it will ever reduce the cost of living?

Mr. ROMMEL. I hope so.

Mr. HUTCHINSON. I know, but I asked if you thought it would.

Mr. ROMMEL. The reduction of the cost of production ought to help. That is the ambition of all of us.

Mr. HUTCHINSON. I know, but it seems that the appropriations increase and the cost of living increases also. I don't see where we are gaining anything.

The CHAIRMAN. What about this soft pork item?

Mr. ROMMEL. We are starting the soft pork investigations under an appropriation granted last year.

The CHAIRMAN. What progress have you made?

Mr. ROMMEL. We have fed some hogs in Southern States that were fed on feeds that we were pretty certain were soft pork producing feeds, and those hogs are now coming in from the outlying stations, are being slaughtered at Beltsville, and a chemical analysis of the fats is being made. We are searching for a competent chemist to put in charge of the chemical work, and we hope to have him before the end of the fiscal year.

The CHAIRMAN. You have no report to make on that?

Mr. ROMMEL. We can not tell you anything except just something of general interest, Mr. Chairman, on that matter. We killed a hog at Beltsville the other day, which came from North Carolina, that had been fed on peanuts. We took some of the pork and made sausage of it, and we could not make that sausage into sausage cakes. We would make little pads of it, lay them out on the pan, and they would flatten out. We made lard from the fat of that hog, and when taken in the hand and squeezed the oil would drip out.

The CHAIRMAN. That is evidently soft pork?

Mr. ROMMEL. I don't think there is any argument about that.

The CHAIRMAN. What do you propose to do?

Mr. ROMMEL. Of course, we want to go at this problem with the idea of solving it. That is the reason we are going slow. Every step that we take will be taken right.

The CHAIRMAN. Have you anything in mind?

Mr. ROMMEL. We have. The first thing we want to do is to find the cause of the trouble. I don't mean what kind of feed you can give them, but what is the reason if you feed hogs penauts, for example, the pork is soft. Now, what is the reason for that, and, also, if you feed him soy beans the pork may be soft? On the other hand, why is it that some other condition may develop, that hog may ostensibly be fed on these soft-pork feeds, and yet the pork will be firm? There may be some physiological questions involved. Now, we are able to do a very large amount of this work right at Beltsville. But to revert to a question you asked a while ago, we can't study the peanut side of this problem at Beltsville, because they can't grow peanuts there.

The CHAIRMAN. You can buy them?

Mr. ROMMEL. No, sir.

The CHAIRMAN. Why?

Mr. ROMMEL. Because the hogs are fed by having them harvest the peanuts. You have a peanut crop and you turn the hogs in on the peanuts. That is where soft, peanut-fed pork comes from. Nobody buys peanuts to feed to hogs, he grows them; and no farmer would listen to us if we told him that we went out and bought peanuts to feed to hogs. He would say we didn't know anything about feeding peanuts to hogs; but if we raised the hogs and raised peanuts to feed them, he would listen.

The CHAIRMAN. Is there a considerable number of hogs fed on peanuts?

Mr. ROMMEL. Thousands of them.

The CHAIRMAN. Is that profitable?

Mr. ROMMEL. Absolutely so. It is an extremely profitable way to feed them, but the trouble is that the peanut hogs are docked all the way from 3 to 10 cents a pound.

Mr. McLAUGHLIN of Michigan. Isn't it true that you find soft pork all over the country, and practically the only way out of it is to feed them corn?

Mr. ROMMEL. I hope it is not true, but I am afraid it will be true with the increase in the use of soy beans for grazing hogs.

Mr. McLAUGHLIN of Michigan. If a farmer in Iowa raises hogs and don't finish them on corn, it is practically soft pork the same as you have in Virginia, isn't it?

Mr. ROMMEL. Now, I am going to ask you a question. Why is it that in Ontario they get soft pork from feeding corn?

Mr. McLAUGHLIN of Michigan. I don't know.

Mr. ROMMEL. I don't know either.

Mr. CANDLER. It is a part of the problem to find some feed by which this pork can be hardened and made more useful?

Mr. ROMMEL. That is part of the problem. The first thing we want to do is to find out what the cause is, and the next thing how to cure it.

Mr. JACOWAY. You can take an acre of Spanish peanuts and get all the nuts off of it, and then you can turn the hogs in there, and each acre will fatten two head of hogs. Now, can't you round those hogs out on about five bushels of corn and harden the pork?

Mr. ROMMEL. I don't know whether that is a fact, Mr. Jacoway. There is a very strong impression that once a peanut hog always a peanut hog.

Mr. RUBEY. What about range hogs?

Mr. ROMMEL. They are not quite as bad, but almost. The first attention to soft pork in this country came from the hogs that were fed on acorns, and then after that we got into the business of feeding hogs on peanuts.

Now, I want to say this much about this question: What makes this one of the biggest regional problems in the hog industry—that is, if Mr. McLaughlin's intimation is true—is that we may get soft pork all over the country. We have here a most serious question, whether hogs can be finished firm on corn or not. If it is true that any oily feed makes soft pork, look out for soft-pork trouble from other things; soy beans, for instance.

Mr. McLAUGHLIN of Michigan. They have already been advised against soy-bean fattening. The farm papers tell them that.

Mr. ROMMEL. Yet more and more farmers are raising their hogs on soy beans.

Mr. McLAUGHLIN of Michigan. They are doing that in the first instance and then finishing them on corn. The farm papers, a number of them that I have seen, are advising farmers against feeding their hogs soy beans with the idea of finishing them on that.

Mr. ROMMEL. That is good advice.

Mr. PURNELL. How does a hog raised on soy feed or peanuts, for instance, compare in weight to one raised on corn?

Mr. ROMMEL. As far as the weight and gains are concerned they do just about as well. Pigs can be fattened just about as economically so far as weight and cost of feed are concerned, but the soft pork shrinks more after the packer gets hold of it. It drips, and that is the reason the packer docks it. A soft carcass loses more weight than a firm carcass will.

Mr. CANDLER. I have an uncle who used to have a big plantation in Florida and he had a great many peanuts, and he fattened the hogs in the fall of the year on peanuts and then took them off of peanuts and put them into a pen and fed them corn in order to harden the meat. I remember he raised one hog that weighed 864 pounds, but of course that was unusual.

Mr. McLAUGHLIN of Michigan. Did that process harden the meat?

Mr. CANDLER. Yes; that was his theory of hardening the meat.

Mr. HUTCHINSON. How does it affect these razorbacks down South?

Mr. CANDLER. You can't do much with them. They are mighty good meat, though.

The CHAIRMAN. Doctor, tell us more in detail what you are doing and what you expect to do next year, and how much money you are using this year for that purpose.

Mr. ROMMEL. The appropriation for soft-pork investigations this year is \$20,000.

The CHAIRMAN. Are you going to use all of it?

Mr. ROMMEL. Absolutely; every cent of it.

The CHAIRMAN. How are you spending it?

Mr. ROMMEL. The first thing we want, as I said, is as good a chemist as we can find, to conduct the chemical work on this project.

Then we will have a few assistants, and some laborers. One of the big items of expense is going to be the matter of animals and feed.

The CHAIRMAN. How much are you going to use next year?

Mr. ROMMEL. The Secretary's estimate is \$20,000.

The CHAIRMAN. For next year?

Mr. ROMMEL. Yes, sir.

The CHAIRMAN. Where is this scientific man to be located?

Mr. ROMMEL. The head chemist will be at Beltsville, at the laboratories there on the dairy farm.

The CHAIRMAN. You would employ a chemist simply for this experiment?

Mr. ROMMEL. Yes, sir. A competent chemist will be in charge of the chemical work, and will put in his entire time on it. He will have under him an analyst, who will conduct the analytical work in the laboratory, and help in other chemical work.

The CHAIRMAN. Where will all that be done—at Beltsville?

Mr. ROMMEL. Only at those points where we have to select some place for hogs to be fed on peanuts. Of course, that is in cooperation with the State stations. We have to cooperate with the State stations. They are to be in with us. We need their interest and their support in the study of these questions.

The CHAIRMAN. Will they cooperate with you in the matter?

Mr. ROMMEL. So far as spending money is concerned, I do not think so.

The CHAIRMAN. No expenditures will be required for improvements, for the purchase of land, or for the establishment of new stations?

Mr. ROMMEL. No, sir.

Mr. ANDERSON. Are we to understand that none of these States are sufficiently interested in the proposition to be willing to contribute anything to the solution of the problem?

Mr. ROMMEL. Every one of the Southern States are studying this, but there is nobody yet that has taken up this problem from the fundamental standpoint until this committee and Congress gave the department the authority to go ahead and put this thing on a fundamental basis.

Mr. ANDERSON. If there are half a dozen, more or less, of the States engaged on this work, and the Federal Government besides, it looks as if we are wasting some money somewhere.

Mr. ROMMEL. May I make another statement not in the record?

Mr. ANDERSON. Let's have it in the record.

Mr. ROMMEL. Then I can not make it.

Mr. ANDERSON. I do not want any sub rosa statements. As far as I am concerned, if it can not go into the record I do not want it.

Mr. ROMMEL. As you say.

Mr. ANDERSON. I notice you have a proposition here in item 64 to inaugurate a study of beef production on northern cut-over lands in Michigan, Wisconsin, or Minnesota. Can you tell us something about that.

Mr. HUTCHINSON. He has gone over that.

Mr. McLAUGHLIN of Michigan. That is in the record.

Mr. ROMMEL. That is in the record.

Mr. ANDERSON. I would like to know what you are going to do with special reference to Minnesota, if I may.

Mr. ROMMEL. The proposition is to establish beef-production experiments in northern cut-over lands, covering the region of the upper peninsula of Michigan, the upper part of Wisconsin, and the upper part of Minnesota. It is an outgrowth of the work of last summer for the relief of live stock from the northwestern drought area. That movement resulted in bringing in some 200,000 sheep and 75,000 cattle into that territory. Nobody had ever done a great deal of work in that section in the raising of cattle and sheep before, and a great many of those men are so well satisfied with what they found here in the way of live-stock possibilities that they want the department to take up experimental work in that area.

Mr. ANDERSON. Is that work done in cooperation with the States?

Mr. ROMMEL. Yes, sir; it will be.

Mr. ANDERSON. Have any of the States appropriated any money for this sort of work?

Mr. ROMMEL. The State of Michigan has a small station at Chatham where they have done some work on forage crops and a little on sheep but nothing on beef cattle.

Mr. McLAUGHLIN of Michigan. Will it be necessary for the Federal Government to erect any buildings at any of these places in Michigan, Minnesota, or Wisconsin?

Mr. ROMMEL. It will be impossible. The Government can not erect buildings on land that it does not own. It is illegal, and we have no intention whatever of doing so.

Mr. McLAUGHLIN of Michigan. With the permission of the State, you could acquire it by gift and would not need an act of Congress.

Mr. ROMMEL. We have no intention of doing that. It will be neither necessary nor desirable, and as the matter stands at present it is not possible. I am absolutely against it. There is no reason at all why we should contemplate the erection of buildings and everything of that kind in a permanent station in that country. There is no call for it, and it is not desirable. If anything of that kind is done, the expenditure could be made by the State. The Government should not put itself in a position in any of those places so that it can not get out without difficulty should it find it necessary to do so.

Mr. McLAUGHLIN of Michigan. On the other side of this question, my understanding is that it is not a State proposition at all. You have not told us of a word from a State official in regard to this proposition in Michigan. It is a request from a few of the residents up there. There is not a State there that has had any conference with you so far as you have stated and I have tried to bring out as to whether there had been or not.

Mr. ROMMEL. We had a conference at St. Paul in July attended by about 200 people, Mr. McLaughlin. That was attended by State officials from the States we are discussing and the Western States on the drought relief area. This question was given very earnest and emphatic consideration at that time. I say we have no formal request, we have no formal letter that I can lay before you; but we have been in conference with State officials, and with officials of agricultural colleges of every one of those States. They were at the conference at St. Paul and these questions came up. We have that. If you ask me for a dogmatic statement along these lines, I can not give it to you. I can not do the impossible. But we have the requests,

many of them, from the people that are in that region and interested in its development, who are anxious to have the cooperation of the department.

Mr. ANDERSON. Are these people actual settlers or land speculators?

Mr. ROMMEL. They are landowners and settlers.

Mr. JACOWAY. Are they large landowners?

Mr. ROMMEL. Some own several thousand acres.

Mr. JACOWAY. Of cut-over lands?

Mr. ROMMEL. Yes; what is left after the timber has been taken away.

Mr. RUBEX. Are these lands owned by corporations that cut over the land and took the timber off or are they owned by the men who have purchased the land from these corporations and who are trying to farm them?

Mr. ROMMEL. They are both. The largest tracts of these lands are owned by the timber companies. Then in addition to that you will find men such as Mr. Frank Hagenbarth, of Idaho, who went in and bought large tracts of land.

The CHAIRMAN. Will you tell us something about your Morgan horses.

Mr. ROMMEL. No, sir; I am not discussing that.

The CHAIRMAN. I notice that is in the note.

Mr. ROMMEL. The note you refer to is this, that one of the points at which we would start investigations in beef production would be at the Morgan horse farms.

Mr. ANDERSON. Is there anything in the general situation in the New England States that would justify a belief in the successful conduct of beef-cattle operations?

Mr. ROMMEL. There is a growing interest in beef production in New England, largely due to the shortage of labor. There was, 40 years ago, in the Champlain Valley, the very section where the Morgan horse farm is located, a considerable beef production industry. That went out with the rapid development of the West, and it has never come back.

Mr. ANDERSON. That is the exact proposition I was trying to get at. Is there now such a relation in cost of production in the New England States and the West that there is any probability that the New England States would be able to compete with the West in beef production?

Mr. ROMMEL. Yes; there are herds of beef cattle being established, especially the dual-purpose kinds. One of the leading dual-purpose Shorthorn herds in New England is in the Champlain Valley, and there is quite a bit of interest in that matter. It has even gone so far that there are certain men here and there who have gone to Texas for steers to feed in New England.

The CHAIRMAN. But there is not sufficient demand to interest the State experiment stations?

Mr. ROMMEL. No; the State experiment stations' funds are entirely confined to studies of dairy production.

The CHAIRMAN. Have all of the experiment stations lost interest in beef production?

Mr. ROMMEL. I do not believe that any station in New England is doing anything in beef production. I do not recall that they are.

The CHAIRMAN. Are they doing any of that work in the States that you have reference to in the notes?

Mr. ROMMEL. There is some independent work in beef production going on in practically all of these States. In the States that are mentioned as doing cooperative work with the department there is no duplication with any work that the State itself is carrying on.

The CHAIRMAN. They are not doing anything independent of the Federal Government?

Mr. ROMMEL. Yes; they are doing work independent of the Federal Government. Their work is not entirely tied up with us.

The CHAIRMAN. Is it necessary to carry it on in two places in the same State?

Mr. ROMMEL. Oftentimes; yes, sir.

The CHAIRMAN. Have you anything else that you wish to say?

Mr. ROMMEL. I have nothing else; no, sir.

Mr. McLAUGHLIN of Michigan. That work in Vermont does not strike me very favorably, Doctor. I do not know why, in an old State like Vermont, where they have worked on this proposition for a long, long time, they would not be able to do it themselves if they want to have it done. I am not greatly moved by this desire on the part of a few people who want the Government to bear the expense and request the Federal Government to do some of this work. Individuals like to throw the burden on the Federal Government. There is hardly a State in the Union that is not trying to avoid its responsibility, evade its duty, trying to throw the burden on the Federal Government to do the work that they ought to do themselves. If you have some particular reason for taking up this work in Vermont, that is one thing. But I say it does not appeal to me. I would like to know what your reason is.

Mr. ROMMEL. We want to find out, if we can, whether it is possible economically to establish a herd of beef cattle in New England. That is one of the things we want to know, and the State has not taken this up for the reason that all the funds they have are taken up with the study of dairy problems.

Mr. McLAUGHLIN of Michigan. They are abundantly able to do it, are they not?

Mr. ROMMEL. They have not the funds.

Mr. McLAUGHLIN of Michigan. Do you mean to say that your interest in the people of Vermont is greater than the interest of the State Government in its own people?

Mr. ROMMEL. No; not at all.

Mr. McLAUGHLIN of Michigan. It would strike me that if that problem is before them and they do not care to take it up it is going pretty far for the Federal Government to do it.

Mr. ROMMEL. We would like to be forehanded, Mr. McLaughlin. I should like to have an answer to the question before it is thrown at me. If I can work out and have the answer ready when the question is put to me, I would rather have it that way than be compelled to conduct an investigation in a hurry, and possibly get a wrong answer.

Mr. McLAUGHLIN of Michigan. I know, but assuming that you would be successful up there, was it your business to make it in the first place, was it the duty of the Federal Government to conduct it,

in view of the abundance of means in their own State, and it being strictly a local problem?

Mr. ROMMEL. I cannot agree with you that it is strictly a local problem. I contend that the problem applies to all of New England and to much of New York State as well. The matter of beef production there applies to that entire section, and somebody ought to be studying the problem. If it is not the function of the Department of Agriculture to study a problem covering such an extensive territory, I do not know whose function it is.

Mr. McLAUGHLIN of Michigan. It may be.

Mr. ROMMEL. Mr. Chairman, there is one point in this soft pork matter that I think that I should lay before the committee for its information, and that is that we have in this work the cooperation of the National Swine Growers' Association. The National Swine Growers' Association has agreed to furnish some of the hogs that we will use in this work; that is to say, hogs that we may get in North Carolina, Texas, or some other place away from Beltsville the National Swine Growers' Association has agreed to purchase, we to pay for the meat from those hogs that we actually use. It is an arrangement similar to the one that the bureau has with the Grove City Creamery in Pennsylvania, which enables us to conduct the work without calling on Congress for very large appropriations and without tying up Federal funds for an annual appropriation for use during just a few weeks or months, as the case may be.

The CHAIRMAN. What is that association made up of—farmers or shippers?

Mr. ROMMEL. They are breeders of hogs.

The CHAIRMAN. Of pure-bred hogs?

Mr. ROMMEL. Yes; very largely. It is represented largely by the membership in the pure-bred swine breeders' associations. I think that ought to be laid before the committee.

The CHAIRMAN. Some one called my attention to it to-day. Have you anything else?

Mr. ROMMEL. I have only one other point to make. In regard to that suggestion I made when Mr. Anderson objected to what he called subrosa statements, I simply want to call attention to this, that we are equipped at Beltsville now to carry on this soft-pork investigation as no other institution in the soft-pork territory is equipped. We can follow these hogs from the time they are born until the meat is put on the table. We can grow the pig, kill it, cure the meat, cook it if necessary, and lay it on the table. We will know absolutely from the time the hog was born exactly how the meat was handled. We are beholden to no one for any step in the investigation.

The CHAIRMAN. No reference is made to it here in the notes.

Mr. ROMMEL. No reference, because no increase is estimated for.

The CHAIRMAN. You simply make references where you ask for an increase?

Mr. ROMMEL. Yes; that is it.

The CHAIRMAN. Does the committee desire to know anything about the horse breeding?

Mr. ROMMEL. I can mention that if you wish it.

The CHAIRMAN. You might state briefly the number of stallions that you have?

Mr. ROMMEL. We have the horse-breeding work in progress at the Morgan horse farm and at the station in Wyoming. That has been in progress for a great many years. The work in Wyoming was formerly in Colorado, but that was transferred to Wyoming last summer.

The CHAIRMAN. You have no station in Colorado now?

Mr. ROMMEL. No, sir.

The CHAIRMAN. What is the highest price paid for stallions at the Colorado or Wyoming station?

Mr. ROMMEL. The highest price that we have paid?

The CHAIRMAN. The highest price paid for stallions by the Government?

Mr. ROMMEL. Three thousand five hundred dollars. That was a great many years ago.

The CHAIRMAN. You are positive about that?

Mr. ROMMEL. Surely. I bought them. Three thousand five hundred dollars was the most that we ever paid for a horse.

The CHAIRMAN. The highest price paid for any stallion owned by the Government at either of the stations?

Mr. ROMMEL. That is the highest price that I know of for stallions that we have had.

The CHAIRMAN. What was the highest price paid at the Morgan farm?

Mr. ROMMEL. We paid \$3,500 for one of the stallions at the Colorado station, and \$3,500 for one at the Morgan horse farm. Two thousand dollars was the highest price we ever paid for any of the horses that we bought for Army work. The average cost of horses for the Army work was approximately \$750.

The CHAIRMAN. I was told that the Government had paid \$18,000 for one of its horses.

Mr. ROMMEL. We have had nothing to do with anything like that.

The CHAIRMAN. There are no other horses except what you have in your charge owned by the Government?

Mr. ROMMEL. The Army has some horses, and the Indian Service has some horses, and so on, but I do not know of any branch of the Government that buys any horses for breeding purposes except the department. I do not think there is any other branch of the Government to be considered. I think you can safely say that the Government has never paid that sum.

The CHAIRMAN. The business is conducted as in the past?

Mr. ROMMEL. Yes; as in the past. The reason for conducting it is simply, particularly with reference to the Morgan horse, that here is an American horse that has in it endurance, feet, legs, and so on, features unexcelled in any other horse. But on account of its small size the breeding of these horses is declining. Small farmers are not breeding them extensively and wealthy men who go in for Morgans may dispose of their studs at any time. It would be a misfortune if the Morgan horse were allowed to die out. In order to prevent this the Government hopes to maintain a small permanent Morgan herd of horses.

The CHAIRMAN. How many Morgan horses are owned by the Government?

Mr. ROMMEL. We try to keep 25 brood mares. That makes in all between 65 and 75 head of horses, of both sexes.

Mr. McLAUGHLIN of Michigan. Do you find anybody interested in taking stock off your hands?

Mr. ROMMEL. Yes; they take a few. We have two stallions in North Carolina, and there are indications now that the Morgan horse may develop as a sire of cow ponies. My own candid opinion is that the Morgan horse is going to be a source of supply of small riding horses. He is never going to compete with the Ford car. If you get some more size in him he will do for handling hilly farms, and the stallions apparently are going to be of use as sires of first-class horses on the range.

Mr. McLAUGHLIN of Michigan. They are naturally small?

Mr. ROMMEL. Yes.

Mr. McLAUGHLIN of Michigan. Does the breeding of them tend to increase their size?

Mr. ROMMEL. We are increasing the size quite a little. Our mares will average around 1,100 pounds now. We are trying to get them up to 1,200 pounds. The stallion at the head of the stud weighs 1,200 pounds; in breeding condition somewhat less. He was shown last Saturday morning at the International Live-Stock Exposition at Chicago and won first in the class.

Mr. CANDLER. What character of horses have you in Wyoming?

Mr. ROMMEL. Mainly standard bred horses. We try to get them to average 1,300 to 1,400 pounds. That work was started under the name of the American carriage horse. We have dropped that name. What we are trying to do is to breed them to the needs of the range, where they will carry a man or pull a wagon. It is a light wagon or utility horse.

The CHAIRMAN. How much are you getting for the Morgan horses?

Mr. ROMMEL. We do not sell any. We have let them out to people who will take them and stand them.

The CHAIRMAN. So far you have not sold any?

Mr. ROMMEL. We have not sold any except culls.

The CHAIRMAN. What is the prevailing price?

Mr. ROMMEL. There is not much demand for Morgan horses. I priced a pair to a Japanese the other day at \$3,000 apiece. He wanted me to tell him how much he would have to pay for the best Morgan horses in the country, and that was my answer. That is the best answer I can give. It runs from there down.

The CHAIRMAN. Are they registered?

Mr. ROMMEL. Yes.

The CHAIRMAN. Are all that you own registered?

Mr. ROMMEL. Yes; our Morgan horses are all registered.

The CHAIRMAN. Is there anything else?

Mr. CANDLER. Have you any horses in Virginia, at Front Royal?

Mr. ROMMEL. Yes; there are about 25 stallions stationed at Front Royal.

Mr. CANDLER. You said that you let out some of those stallions, have stood them under certain regulations of the department?

Mr. ROMMEL. Yes.

Mr. CANDLER. What are they?

Mr. ROMMEL. The two horses that were sent to North Carolina were sent down under condition that the farmers taking them were vouched for by the State College of Agriculture, that they should pay all the expenses, and they agreed not to charge over a certain service fee.

Mr. CANDLER. They paid all the expenses for having them?

Mr. ROMMEL. Yes; we are subject to no expense whatever, and we reserve the right to bring the horses back at any time if it seems desirable to do so. In the case of the horses in the Army work, the probability is that hereafter they will be stood at a flat service fee.

The CHAIRMAN. You gave the number of stations, including the number of horses at each station?

Mr. ROMMEL. If I may I will supply that for the record later.

The CHAIRMAN. Is that all?

Mr. HARRISON. That is all.

1 Does not include the 4 stallions in the Army horse-breeding work at Middlebury, Vt.

STATEMENT OF DR. JOHN R. MOHLER, CHIEF OF THE BUREAU OF ANIMAL INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

Dr. MOHLER. The next item I would like to discuss is number 65, on page 54, "for all necessary expenses for scientific investigations in diseases of animals, including the maintenance and improvement of

the bureau experiment station at Bethesda, Maryland." With this appropriation, we are working on rabies, glanders, forage poisoning, anthrax, swamp fever, poultry diseases, parasites, and various other troubles of live stock. We are asking for an appropriation of \$15,000 for the investigation of round worms of hogs. Recent investigations have shown the great importance of parasitic round worms to the hog industry. These parasites are responsible for many of the losses among young pigs, amounting to millions every year. At the present time we have no allotment for this investigation, and therefore it is a new item proposed for next year's estimates. There was a project for investigating round worms of hogs several years ago, but this was temporarily discontinued as a separate project and it should now be revived.

Such experimental work is now in progress on a small scale, but should be greatly extended so as to cover conditions in various parts of the country. From preliminary experiments, it appears possible that these losses can be prevented by comparatively simple measures, but it is necessary first to carry out the tests of methods under actual field conditions in four or five selected localities of the country before it will be possible to establish the best methods for the control of the parasites in question. Those parasites you all know as the long white round worm in the intestines of hogs. You see thousands of them every time you go to the packing house and our men have found an entirely new cycle in the life history of this round worm. Heretofore we have always thought the pigs drank stagnant water or ate contaminated feed, containing the little eggs of this parasite, and when they got into the intestines that those eggs hatched out and developed into this worm without leaving the intestines. Now the work of our laboratory men has shown that this old idea is erroneous. They have proved that after the eggs are hatched out the small larvæ crawl up into the liver, and are carried by the blood into the lungs, causing pneumonia, which produces a great number of deaths in young pigs.

You will find the little larvæ of the worms going through this cycle, which must take place in the lung. After they have become a little larger in the lung tissue, they crawl up into the trachea (the wind pipe), and when they reach the gullet are swallowed and go down to the intestines where they develop into these long white worms. Heretofore the trouble they produce in the lungs has been called hog cholera, and various other terms, but nobody really knew the effect of this larval stage of the intestinal worm on the health of pigs until our laboratory workers made this discovery.

The CHAIRMAN. Is it not a fact there are more losses from this worm than from hog cholera?

Dr. MOHLER. I would not want to say more, but I will say that there are very heavy losses from it.

Mr. LEE. Has there been any scientific investigation?

Dr. MOHLER. That is what we want with this \$15,000.

The CHAIRMAN. What do you propose to do?

Dr. MOHLER. To get out into the corn belt and establish four or five stations for practical studies under field conditions.

The CHAIRMAN. What are you going to do after you establish your stations?

Dr. MOHLER. We are going to cooperate with the producer of hogs, and get him to leave 50 per cent of the litters under the conditions he usually keeps his hogs. We will take the other 50 per cent and put them under what we term sanitary conditions, and administer treatment to see what the result will be. We want to establish a series of field experiments in four or five localities of the corn belt.

Mr. ANDERSON. Is this to be a continuing item?

Dr. MOHLER. I do not see any necessity for its being a continuing item after we find out the proper methods of prevention. It will be merely a question of education after we find a satisfactory method for eliminating the danger.

The CHAIRMAN. Do you propose to treat the hogs?

Dr. MOHLER. Yes; we are going to treat the hogs as well as handle them under sanitary conditions. We do not know all the things we are going to do yet, as they will be developed as the work proceeds; this is purely for an experimental investigation. We have one or two farmers cooperating with us in Illinois at the present time. They are standing all the expense and we want to duplicate that work in four or five other communities. As I say, we have already done a very limited amount of sanitary control work in this line that has produced very satisfactory results. It is more or less of a laboratory experiment now, and what we want to do is to extend it into the field to determine whether it is going to work out on a large scale or not.

The CHAIRMAN. Are there any remedies on the market?

Dr. MOHLER. There are all kinds of remedies, yes, sir, that are being sold. Some are fair and some are no good. But there is no true remedy to-day.

The CHAIRMAN. Do you propose to discover a new remedy?

Dr. MOHLER. I do not think there is going to be any discovery of that kind, because after the little larvæ get into the lung it is very hard to get rid of them in that structure. The need is to destroy the larva before it gets into the lung, or even before the egg reaches the intestinal tract.

The CHAIRMAN. How large is the worm?

Dr. MOHLER. The worm is 10 or 12 inches long, but the egg is microscopic. The little larvæ that develop, and which crawl up into the bile ducts and thence into the lung, are about a twelfth of an inch long, but they are so narrow that they are still microscopic. After they crawl up into the trachea and pass down the gullet into the intestines, they become mature and are then 10 or 12 inches long.

The CHAIRMAN. Something like a tape worm?

Dr. MOHLER. No; it is a round worm.

The CHAIRMAN. Similar to the worms children have?

Dr. MOHLER. Yes; probably the same thing as the long, white worm in babies.

The CHAIRMAN. Is it confined to the intestines of hogs only?

Dr. MOHLER. That is the thing we are interested in now. The results of the work we are trying to do may be applicable to the health of children. Round worms are not infrequent in babies, and in the human family the life cycle of the worm takes the same course.

Mr. McLAUGHLIN of Michigan. How does it first get into the hog?

Dr. MOHLER. It is swallowed in feed or water. The feed or the water becomes contaminated by the feces of an infested animal

carrying the female worm in the intestines. This female lays eggs, and those eggs pass out of the intestines in the feces and are deposited on the feed or in the water.

The CHAIRMAN. From cattle?

Dr. MOHLER. No; from hogs. Heretofore we thought the hog swallowed the eggs and the eggs passed into the intestines and hatched out and became adult without leaving the intestines, but our work shows that this is not the case. It hatches out, but does not develop in the intestines at that time. It travels up the bile ducts and goes into the lung and causes pneumonia, and it is at this stage where the losses are so great.

The CHAIRMAN. When did you develop that?

Dr. MOHLER. It was just published recently, about four months ago.

Mr. MCKINLEY. You are furnishing that to all these county agents?

Dr. MOHLER. Yes, sir; but we have not enough information yet to decide which are the best and most practical preventive measures. It has been published in some scientific papers and news letters, but we want to get more practical results and then put it into the hands of the county agents or any other persons who can help handle this trouble.

Mr. RUBEY. How long have you been acquainted with this worm?

Dr. MOHLER. This worm has been known for over a hundred years, and has been important ever since parasites were studied.

Mr. RUBEY. How does it happen that we are just commencing to go after it?

Dr. MOHLER. It is the first time we knew the life cycle was as I have described it. Heretofore we have always considered the hog swallowed the egg and the egg went into the intestines and hatched out and matured, just like the tape worm. But it is more like the hook worm; we used to think the children down in the South swallowed the hook worm larva and it developed in the intestines directly; but now we know it penetrates through the healthy skin of the feet for instance, and after entering the circulation it reaches the lungs and then the intestines, like the hog worm. It is a wonderful requirement of nature that certain worms have to go through the other tissues to get to the place where they are usually found.

Mr. McLAUGHLIN of Michigan. The main thing is to keep it out of the hog?

Dr. MOHLER. That is it.

Mr. McLAUGHLIN of Michigan. But you can not stop its movement after it gets into the hog?

Dr. MOHLER. No, sir; when it gets into the lung it is impossible.

Mr. JACOWAY. When the worm gets in the lung, what percentage of the hogs die?

Dr. MOHLER. Over 10 per cent of them die.

Mr. JACOWAY. When it gets into the hogs, what percentage of the herd is infected by this worm?

Dr. MOHLER. Usually where they have a large infestation they all get it.

Mr. JACOWAY. And when it strikes one herd it is pretty likely to go through it?

Dr. MOHLER. It is.

The CHAIRMAN. Why could not this be done in connection with the hog-cholera work?

Dr. MOHLER. Because this is an experimental parasitic investigation and the other is the practical eradication of infectious disease. This investigation is being carried on in our zoological laboratory, and hog-cholera control is under one of our field divisions.

The CHAIRMAN. Are not the men assigned to the hog-cholera work capable of attending to this as well?

Dr. MOHLER. No, sir. This work is done by trained zoologists—men familiar with the life histories of various parasites. If we had placed the men now engaged on hog-cholera work on this investigation we would never have found it.

The CHAIRMAN. Could you not devote the funds for hog cholera to this work?

Dr. MOHLER. It is impossible to transfer our funds which are given to us specifically for hog cholera and apply them to the study of parasites.

The CHAIRMAN. We can change the language, if necessary.

Dr. MOHLER. I hope we will be given the \$15,000 extra. We need this \$15,000 for this specific purpose.

The CHAIRMAN. When you start at \$15,000 that means \$150,000 the next year, and it will be up in the millions before we get through with it.

Dr. MOHLER. I will guarantee we won't need any million dollars for this work. As I said to Mr. Anderson, this is not going to be a continuing appropriation. We started on this work before the war and stopped; we stopped all this kind of scientific investigations and got right down to brass tacks to study the things that were going to help win the war. Now we have taken it up again and have been carrying it on out of our general funds, and it has developed into a big thing. I would not be surprised but what the results these men will accomplish with this \$15,000 will do more to help the hog industry than any other one item outside of the hog-cholera item.

We are just beginning to learn about the great losses from this round worm.

The CHAIRMAN. The trouble is that this \$15,000 will be up in the millions in a very short time.

Dr. MOHLER. One of the scientists in the bureau published an article only a few months ago in the American Medical Association Journal, a leading journal of the physicians of the country, showing the importance of the work to human life, and I think our estimate of \$15,000 is very conservative. This is not the maximum amount they thought they could use; they could use a great deal more; but this is the conservative estimate of the department after considering all of the possibilities. I do not know any \$15,000 where we are going to show more results than from this particular item.

Mr. CANDLER. How long do you think it will take you to investigate it fully if you start this year and continue from time to time?

Dr. MOHLER. You know scientific investigations go in a very peculiar line. You can not foretell—you can not foresee what is going to happen. You have to keep studying the problems until definite results are obtained. It is just like our studies of hog

cholera; we worked on hog cholera for 20 years before we found a serum for the disease. We may find a prophylactic treatment for this disease at any time.

Mr. CANDLER. But you do not think it will require any large addition to the appropriation from year to year?

Dr. MOHLER. No, sir; it will not require any large addition to the appropriation from year to year. All we want to do to-day can be done in four or five different localities, and it will cost around \$3,000 in each locality to do the work.

Mr. JACOWAY. If we give you \$15,000 would you be willing to sign an affidavit that you will not want \$30,000 next year?

Dr. MOHLER. Yes, sir; I will be glad to do that. This is a very conservative estimate, I think, considering, as I said before, the importance and the potentialities of this work. And you know in your section the hog raiser has more trouble with worms than any other thing outside of hog cholera itself.

The CHAIRMAN. There is no question as to the merit of the proposition, but how are we going to handle it? It seems to me you might connect it with some other activity and do away with some of those overhead charges and continuing appropriations.

Dr. MOHLER. We are asking in this appropriation for \$141,450. That covers all of our investigations of animal diseases. This hog-cholera work you are speaking of is eradication work.

The CHAIRMAN. Why can you not draw on the general funds for the diseases there and use part of them for this purpose?

Mr. TINCHER. I like this kind of an appropriation, but what I do not like about it is the next one, for instance, containing new items for your work. The Government spends money to find out how to treat it and take care of it, and then I do not like, as the Chairman says, the \$1,000,000 we have to spend after that to force the fellow interested to use the treatment after you find it out for him. I do not think there is any occasion on earth for the Government to spend a dime now to persuade people to use the hog cholera treatment. You have the treatment; you have the vaccine that will prevent it; and anyone who is interested to the extent of owning hogs ought to have enough thrift, without the parental guidance of the Government, to use it.

Mr. HEFLIN. But, if he won't use it, the Government must use its power to suppress the disease.

The CHAIRMAN. What is the next item, Doctor?

Dr. MOHLER. The next item is an increase of \$4,000 in our animal-disease investigations, for developing and thoroughly testing a new method for blackleg immunization. This method gives promise of being a more effective agent against blackleg than the old powder form of vaccine which we are giving out at the present time. At present we have no appropriation specifically for this purpose.

I would like to say, during this last year the amount of blackleg vaccine distributed to stock owners was over 4,000,000 doses. Due to improved methods of immunization now in vogue throughout the country for blackleg, we have conducted experiments along these lines, and material progress has been made. Lack of sufficient help and, moreover, insufficient funds to conduct extensive experiments with large experimental animals has hampered the work so that it is not conclusive.

Definite mention should be made of the improved method of immunization by combining blackleg filtrate and killed prodigious cultures. These tests, of necessity, were conducted with small animals, yet the results obtained were so pronounced that it is most desirable to finish up this work on cattle, where it is felt the great advance of this method over the plain filtrates will be demonstrated. The new laboratory at Bethesda needs some rather expensive equipment to inaugurate the production and distribution of filtrates for the blackleg disease, and only when so equipped will it be possible to turn out the product in quantities for distribution to the cattlemen who are now requesting a better product than the powder form of vaccine. It is suggested that \$4,000 be made available for the production of blackleg filtrates for immunization purposes and for laboratory equipment to make this product of the highest potency.

MR. McLAUGHLIN of Michigan. Speaking generally of these vaccines and serums, you recall that only a few years ago there was great difficulty in getting the pure stuff. The private manufacturers did not turn out the right kind of stuff, it was not reliable, and some of the States had difficulty. Your bureau had confidence in a stuff you made yourself, or which was made under your direction. What is the general situation now? Are they making all those different things better, and so on, and in sufficient quantity?

DR. MOHLER. Yes, sir. You remember, Mr. Chairman, as the result of the act of Congress of 1913, the preparation of all these biological products for use on animals has been placed under the Secretary of Agriculture. The result has been we have supervision over all the establishments that prepare these serums, vaccines, and toxins for interstate commerce. And I think you will find the consensus of opinion of the users of those products is that the results have been very much more satisfactory.

MR. McLAUGHLIN of Michigan. You have inspectors then at each one of the private places where any of this kind of stuff is made?

DR. MOHLER. Yes, sir; we have them all under supervision. We do not have a man in each place. We have a man in every place where hog cholera serum is prepared, and he is given a territory contiguous to those serum plants in order that he may cover the firms that make tuberculin, vaccines, mallein, etc.

MR. McLAUGHLIN of Michigan. How large an inspection force have you in these different factories?

DR. MOHLER. That will come up in another item, but the number is about 94 at the present time.

MR. JACOWAY. From this hog-cholera propaganda, or policy, that the Government has been engaged in for several years, what per cent of the herd do you imagine is preserved and kept from dying?

DR. MOHLER. That will come under the hog-cholera item, but I may answer your question specifically in saying that this last year the losses from hog cholera have been reduced to 37 per thousand hogs, which is the lowest in 36 years and is principally the result of the cooperative work of the States and the Federal Government in this hog-cholera-eradication campaign. That will come up in another item.

MR. TYNCHER. I see you say, "Testing a new method of blackleg immunization."

DR. MOHLER. Yes, sir.

Mr. TINCHER. The old method which was used made immune for one year? Now they have a method by which they are made immune for all time?

Dr. MOHLER. Yes.

Mr. TINCHER. Whose device is that new method? Is that the Government's method or some State's?

Dr. MOHLER. The original work was done by one of the biological companies in the East and then was taken up at your Kansas experiment station by two of the workers there.

Mr. TINCHER. There is no question about the success of that serum?

Dr. MOHLER. No, sir; it is very satisfactory. But we can not supply that, because we would have to have about 20,000 calves brought into Washington to make an aggressin similar to what is made at the Kansas Agricultural College.

Mr. TINCHER. Here is what I am getting at: Any man who wants to now, who owns a herd of cattle, can buy a vaccine?

Dr. MOHLER. Yes, sir.

Mr. TINCHER. And when they vaccinate a calf they can make it immune for life?

Dr. MOHLER. That is right.

Mr. TINCHER. That has been tested and found to be a success?

Dr. MOHLER. Yes, sir.

Mr. TINCHER. Now, you intend that the Government find a cheaper vaccine that will do that; is that the idea?

Dr. MOHLER. That is the idea, to make a vaccine here in Washington that will be just as efficacious and less difficult to prepare than the method of producing aggressin.

Mr. TINCHER. And you ground your work on what the Kansas Agricultural College has done?

Dr. MOHLER. Yes, sir; to some extent.

Mr. TINCHER. It costs now in the neighborhood of 30 cents to vaccinate the animal and to make him immune for life?

Dr. MOHLER. That is right.

Mr. TINCHER. But there is no question about the success of the vaccine?

Dr. MOHLER. It is quite satisfactory.

Mr. RUBEY. In the present method, they have to have some sort of an instrument?

Dr. MOHLER. Yes, sir.

Mr. RUBEY. And in the new method—

Dr. MOHLER. In the present method we have a powder. We make a suspension by grinding it up with a mortar and pestle, place it in a syringe, and inject it into the animal. We are working on this new solution now, and all we will need is a hypodermic syringe, which will do away with the mortar and pestle, grinding, filtering, etc.

Mr. McLAUGHLIN of Michigan. Do you require the services of a skilled man to demonstrate this remedy?

Dr. MOHLER. No; we are distributing these 4,000,000 doses to the stock raisers throughout the country, and they, as a rule, perform the operation themselves. All you have to do is to make a hypodermic injection; you do not have to take any readings or anything of that kind after the injection.

Mr. McLAUGHLIN of Michigan. You just give the animal a shot of it and let it go at that?

Dr. MOHLER. That is all that is necessary.

The CHAIRMAN. The treatment is similar to that for hog cholera?

Dr. MOHLER. Only it is simpler to apply, because in the treatment for hog cholera you give a serum and a virus, and the virus is a deadly product and may cause death if it is not handled properly. This aggressin is absolutely inert and does not produce any disease; but will prevent the disease.

Mr. TINCHER. The treatment is the same as the old method, only it gives immunity for life instead of for one year?

Dr. MOHLER. That is it.

Mr. TINCHER. Your idea is with this appropriation to find something that can be manufactured cheaper and furnished the people cheaper?

Dr. MOHLER. We are not satisfied in giving out 4,000,000 doses of blackleg powder when some commercial concerns are selling other kinds of blackleg products which may be superior. And we can not possibly make blackleg aggressin, because we would have to buy 20,000 calves, bring them to Washington, inoculate them, produce a blackleg swelling and then, after the calf dies, take the blackleg tissue and make the aggressin. That is why it costs from 30 to 35 cents, because you have to use a calf every time you make from 500 to 1,200 doses of the aggressin. The way we make the powder is to inoculate the calf, and after it dies, take the infected meat and dry it. We then make a dough of it by adding water, and bake it, and then grind it up into a powder. We get about 30,000 doses from every calf.

Mr. TINCHER. What is the object of the Government in keeping up the manufacture and free distribution of one-year immunity vaccine?

Dr. MOHLER. As far as I am concerned, there will be no objections to stopping it. It is on the same principle as giving away flower seeds the way we do every year.

Mr. TINCHER. There is now a preparation on the market that has been demonstrated a success.

Dr. MOHLER. Yes, sir.

Mr. TINCHER. And 90 per cent of it is sold by private companies?

Dr. MOHLER. Yes, sir.

Mr. TINCHER. By correspondence with your department, I could write you and get, for nothing, just as good a vaccine for cattle as I want, but my neighbor goes out and buys it.

Dr. MOHLER. It is routine work with us. We just inoculate the calves, produce blackleg meat, bake it, grind it up into a powder and send it to you. It is purely a routine procedure. You can buy blackleg vaccines in many towns in the West. We would be pleased to be relieved of the necessity of making that material, but as long as a Congressman asks for so many doses for his constituents, we are glad to supply it. I think our province is to make investigations in a fundamental way, to find a proper method, and then when we find it, to let commercial houses manufacture and sell it to the country.

Mr. McLAUGHLIN of Michigan. That is along my talk yesterday.

Dr. MOHLER. This is a different kind of a proposition from what we discussed yesterday. We have to be the leaders in eradication

and control work, and we have been the leaders in this blackleg vaccine work for twenty years. This was started in 1896, but we should be permitted to adopt new methods or stop.

Mr. McLAUGHLIN of Michigan. But you do not have to be leaders and laborers, too?

Dr. MOHLER. You know the tuberculin test we discussed yesterday takes considerable judgment outside of the manual labor involved.

Mr. TINCHER. How much of the appropriation is used for the free distribution of a vaccine of that kind?

Dr. MOHLER. We have no specific appropriation for this work now. It is a very inexpensive affair. We use several veterinarians part of the time on this work. We send one man out to the experiment station to-day and some other inspector next week. There are also two clerks employed for handling the mail, keeping records, etc. We are asking for a specific appropriation of \$4,000 for this particular project.

Mr. TINCHER. I think you ought to have the \$4,000, but I wonder if you can not take that out of the fund with which you have been furnishing free vaccine which has already been tested and of which everybody knows the merits?

Dr. MOHLER. No, we could not. You gentlemen gave us enough money, \$5,000, two or three years ago, before the war, to build a laboratory to develop this work. The laboratory was not built, for the reason that we did not want to do any building during the war period. Now, we have the laboratory there and we want to equip it. During that interval, we have been working in the laboratory piece-meal on various investigations of blackleg, and we have found that this combination of a blackleg filtrate with a prodigious germ, has produced very satisfactory results in the vaccination of the smaller animals.

Mr. TINCHER. What do you think about the policy of encouraging a man now to use the one-year vaccine from the standpoint of producing results?

Dr. MOHLER. It is not nearly as satisfactory as to make the animal immune for a longer period, of course.

Mr. TINCHER. It just occurred to me, if a man wrote to me and asked me to get him free vaccine for one year's immunity, if I was honest with him, I would write and tell him he did not want it.

Dr. MOHLER. If my friends wrote and asked me whether they should use blackleg powder or aggressin, I think I would tell them what I thought of the powder and to buy the best they could get. I do not like to be in the position of distributing 4,000,000 doses of something that is not the best on the market, and I think we ought to receive funds to improve the product and find something which is most satisfactory.

Mr. ANDERSON. Why can you not stop it if you want to? Is there any law to prevent that?

Dr. MOHLER. Because you send in a request for the bureau to furnish John Jones, of Minnesota, with 100 doses of blackleg vaccine.

Mr. ANDERSON. No, I never did that. What do you want us to do; to put a limitation on this appropriation to the effect that it can no longer be done?

Dr. MOHLER. It would require a specific statement to the effect that hereafter none of this money shall be used for the distribution of blackleg vaccine. That is the only way I can see you can stop it. As long as there is no provision against it, we will have to comply with the requests of Congressmen.

Mr. McLAUGHLIN of Michigan. That is in this paragraph, is it?

Dr. MOHLER. Yes, sir.

Mr. WILSON. If that is true, why do you want to develop a new method?

Dr. MOHLER. Because, as I tell you, the old method is not as satisfactory as what we think this new method will be.

Mr. TINCHER. The old method makes a calf immune for one year. They use that because they can get it free. There is a new method which is absolutely satisfactory and a success and it makes them immune for life.

Mr. WILSON. If they know that method, why don't they use it?

Mr. TINCHER. The Government does not know that method; Kansas knows it. That is, the Government knows it, but it can not furnish it.

Dr. MOHLER. Of course, we know it, but the method of Kansas is the most expensive method and now we are trying to get the same results with a cheaper method.

The next item is for an increased allotment of \$1,650 to extend the investigations of stock poisoning by plants. Our present allotment is \$11,450, which does not allow for much work outside of that carried on in connection with livestock interests in the Western States. There are many problems in the East and in the South which should be investigated. From the South especially many complaints are made of the loss of live stock from presumably poisonous plants, with demands for investigation. These demands can not be met without additional appropriations. It is also desirable that more should be spent for investigation in the West, and in order that the results of the work can be made available to the stock people, it is important that it should be possible to respond with more freedom to requests for addresses at live-stock conventions. If these things are done it will be necessary to add to our present funds, and it would seem that a total appropriation should be made of not less than \$13,100. It perhaps should be stated that this sum will not permit any great enlargement of the work and that a much larger sum could readily be used.

Mr. ANDERSON. How long has this contagious abortion work been going on?

Dr. MOHLER. It has been going on for four years.

Mr. ANDERSON. It strikes me it has been going on as long as I have been on this committee and before that.

Dr. MOHLER. I think you will find it is about four years.

Mr. WILSON. Contagious abortion?

Dr. MOHLER. Yes; of cattle.

Mr. McLAUGHLIN of Michigan. Have you not learned all there is to know about that and how to treat it?

Dr. MOHLER. If you would attend some of these conventions and hear the discussions you would think there were as many ways to treat it as there are men who talk on it.

Mr. McLAUGHLIN of Michigan. It is the same old thing.

Dr. MOHLER. Yes; no great discovery of value for handling contagious abortion has been made like that for the elimination of ticks, the eradication of scabies, and the prevention of hog cholera. The present position of the investigation of abortion in cattle is about the same as the investigation of influenza in men. There has not been any panacea found as yet, and we are still investigating the whole problem.

Mr. TINCHER. Every manufacturing institution that manufactures serums pretends every spring they have an absolutely new one that will positively cure it; but they are all failures.

Dr. MOHLER. Yes; not one is past the experimental stage as yet. We are doing more to get control of contagious abortion by applying sanitary measures and by keeping heifers that become pregnant away from aborting cows, using the herd-management method, with sanitary measures. That has been the most satisfactory method that has developed thus far. There is a great conflict of opinion, you know, with regard to this disease. One investigator says the bull carries the disease to the cow and the other expert says it all comes from the mammary gland, that the infection enters through the teats of the cow; another fellow says the infection comes from contaminated feed. These investigations take a long time, because a cow has only one calf in the year and you can not rush these experiments when studying a disease like abortion.

Mr. TINCHER. There are lots of herds of cows in the United States, and that item would not cover the loss in cows next spring in one herd.

Dr. MOHLER. That is true.

Mr. TINCHER. If they have any prospect of finding a cure for abortion of cows, the appropriation does not amount to anything.

The CHAIRMAN. Are you making any progress on this?

Dr. MOHLER. Yes; we are. But, as I say, the work is slow; at most, you get only one line of results from one animal in one year, because we are working with the pregnant animal entirely. Conclusions are liable to be wrong when drawn from a few experiments, and therefore we try to have the work checked well.

The next item is No. 66, on page 56, "For investigating the disease of hog cholera and for its control or eradication." The old appropriation is for \$641,045, and we are asking for \$658,945, which is an actual increase of \$30,000. We are asking for this additional amount in order properly to carry out the provisions of the act requiring the supervision of the manufacture of viruses, serums, toxins, and analogous products. On the point brought up by Mr. Jacoway a few minutes ago, we have at the present time 95 plants under license. Last year we had only 88. This year we have 135 licenses issued, against 126 last year. So you will note a considerable increase of the number of plants which are now manufacturing biological products.

Mr. McLAUGHLIN of Michigan. Do you have any difficulty in making these plants comply with your regulations?

Dr. MOHLER. No, sir; we are having very good results in getting their cooperation.

Mr. McLAUGHLIN of Michigan. Do you see a marked improvement in the quality of their products?

Dr. MOHLER. Yes, sir; and also the users say the same thing. I just want to call attention to the fact that the quantity of anti-hog-cholera serum produced in the calendar year 1918 was 132.5 per cent more than the average for the last three previous years. It was also 111 per cent more than that produced in the preceding calendar year. The quantity produced from January to October, inclusive, in 1918, was 409,473,248 c. c., while for the same period in 1919, 582,662,674 c. c. were produced, or 42.2 per cent more than for the same period of the preceding year. During the fiscal year ending June 30, 1919, there was produced 148 per cent more anti-hog-cholera serum than for the preceding fiscal year. This large increase in the volume of products produced of course means that all details relating to inspection are likewise increased in volume. Such details include the inspection of animals presented for admission to licensed establishments, as well as each time before these animals are bled for serum or virus purposes. They also include the supervision of tests made to determine the purity and potency of the product produced. Numerous other details, including the supervision of all operations, are also included.

Mr. HUTCHINSON. What are the results of this increase; have you reduced hog cholera?

Dr. MOHLER. Yes, sir; to 37 deaths per 1,000 hogs.

Mr. HUTCHINSON. Have you the figures there?

Dr. MOHLER. Yes, sir. That is one of the reasons we want \$30,000 additional to supervise biological plants making hog-cholera vaccine, tuberculin, mallein, and these various other products, so that only the best serum and vaccine will be prepared.

The CHAIRMAN. What is the current value of the output of all these plants?

Dr. MOHLER. There were 582,662,674 cubic centimeters.

The CHAIRMAN. About how much per cubic centimeter?

Dr. MOHLER. I should think that the average price, taking wholesale and retail rates, would be about 1 cent a cubic centimeter. So you can figure it out quickly by putting your decimal point in front of the last two figures.

Mr. MCKINLEY. Between \$5,000,000 and \$6,000,000 worth.

Dr. MOHLER. Yes, sir.

Mr. TINCHER. This increase of the production of the serum, the demand for it, is accounted for by two reasons: One, the increased value of the hog?

Dr. MOHLER. That is right.

Mr. TINCHER. And another is the fact that the hog raiser and producer knows if he will vaccinate his pigs he can make them immune from cholera?

Dr. MOHLER. Yes, sir.

Mr. TINCHER. What do you think of this proposition: While its use is certainly commendable and it was a great thing for the Government to demonstrate and to find out for the producer and for the private manufacturers of serums, to investigate their plants and inspect them and make them comply with Government regulations in the manufacture of the serum, why is not that all the money now the Government ought to continue to spend on hog-cholera vaccine, just to make the private owners of the plants comply with the Government regulations, and buy the right kind of hogs for the purpose of

making it? Has not the experiment on the hog-cholera vaccine gone sufficiently far?

Dr. MOHLER. Yes, sir; we believe that is true, so far as the experiment on the use of the hog cholera serum is concerned. But it is like all of our infectious disease work, we are endeavoring to protect the Nation's live-stock industry. The organic act creating the Department of Agriculture states that its function is to develop and disseminate information along agricultural lines. I feel sure you could meet a lot of people in the next few years who had never heard anything about the hog cholera serum. And if you are going to protect the food industry of the country, the department will have to keep on educating the farmers and the hog raisers, for infectious diseases know nothing of State lines.

Mr. ANDERSON. What is the character of the eradication work you are doing now? Is it intensive work in a few counties, or is it scattered all over the country?

Dr. MOHLER. There has been no relaxation of effort, reduction in the field force, or in the scope of the work of the hog cholera eradication division since the termination of the war. The hog cholera activities continue to be carried on in 34 of the principal hog-raising States in cooperation with the State regulatory authorities and extension divisions of the State agricultural colleges. The efforts are State-wide, or as nearly so as the funds will permit. At present 143 veterinary inspectors are engaged in hog-cholera control work.

In 10 States, namely, California, Colorado, Montana, Louisiana, Kentucky, Nebraska, Ohio, South Dakota, South Carolina, and Tennessee, the hog-cholera control work has been consolidated with the other bureau animal-disease work and in each State the consolidated work has been placed under one directing head who divides his time, as necessary, among the different lines of work. It is the policy of the bureau to gradually extend its organization to other States with the view of reducing overhead expenses and increasing efficiency through creating more elasticity of the working force.

The results obtained during the fiscal year ended June 30, 1919, are gratifying. The number of outbreaks of cholera reported were 12,336; investigations made on farms where outbreaks of disease occurred, 51,022; post-mortems conducted on farms, 53,586; meetings held in hog-raising districts, 2,734; attendance at the meetings held in hog-raising districts, 78,584; inspectors' personal interviews with live-stock owners, 315,359; farm visits made, 93,512; miles traveled by bureau representatives, 2,029,519; hogs treated by bureau representative as demonstrations, 233,957; farms quarantined, 9,564; infected premises cleaned and disinfected, 4,382; number of hogs on farms January 1, 1918, 71,374,000; number of hogs on farms January 1, 1919, 75,587,000, and increased production during past year, 4,213,000.

The mortality of swine from all diseases was further reduced to 41.4 per 1,000, which is equivalent to about 37 per 1,000 from hog cholera, which is the lowest mortality that has been recorded in 36 years. The reports seem to indicate that during the present year even better results are being obtained. The men in the field are not directing their efforts so much to treating large numbers of hogs themselves as in teaching veterinary practitioners and others how

properly to make the diagnosis and administer the treatment; also in showing farmers through demonstrations, lectures, and personal interviews on the farm how they may protect themselves against losses from hog cholera and other swine diseases. This class of animal disease work is constantly growing in popularity, as evidenced by increased demands for extension of the service in States where it is being pursued, as well as to new States.

The experimental period of hog cholera work has been passed in most of the 34 States and it is gradually assuming a more intensive form. Although the bureau is confident that much good could be accomplished in the conservation of swine by increasing the funds, it feels that it is not justified in asking for an increase in the appropriation until the States make specific appropriations to cooperate with the bureau in this work on a 50-50 basis. On the other hand, it is believed that there should be no decrease in the appropriation, nor relaxation in the field activities, but that special consideration in the allotment of National Government funds should be given to those States that provide funds to cooperate with the bureau on an equal basis.

Mr. ANDERSON. You spoke of some 300,000 interviews with producers of the States. What do you mean by that?

Dr. MOHLER. That means our men have gone to the farms or had their meetings in different places, in schoolhouses, courthouses, at picnics, and places of that character, and have met these men and discussed the methods of hog cholera eradication.

Mr. ANDERSON. That means just conversations; it does not mean any demonstrations or anything of that sort?

Dr. MOHLER. No, sir. Demonstrations have been made on 233,000 hogs. These others are personal interviews with live-stock owners.

Mr. CANDLER. They discuss methods of procedure and it is the giving of information and securing of information from them?

Dr. MOHLER. Everything pertaining to the eradication of cholera.

Mr. JACOWAY. How many hogs have been saved by giving this treatment; do you know?

Dr. MOHLER. We have no way of determining that because we do not do any actual work except demonstrations. The only thing I can say as to the demonstration of the results is that the loss from hog cholera last year was the lowest for many years, namely, 37 out of every 1,000 hogs.

Mr. JACOWAY. I think your work is a great work, and I just wanted the record to disclose here for the benefit of others what good you are doing and how you spend this money. I am sure it is a good work, and I am in favor of it and very much interested.

Dr. MOHLER. Yesterday I spoke of our men having supervised the vaccination of over 640,000 hogs in public stockyards. That was probably three times more than was done the year before and twenty times more than was done in 1917. The only way we can get a line on the results is in the general benefit, so far as the loss reduction is concerned, throughout the entire country. And as I said before, those losses are lower last year than they have been for 36 years.

Mr. ANDERSON. Is not the loss relatively lower in the States in which you did the work than in the others?

Dr. MOHLER. Yes, sir; a great deal. We did most of the intensive work in the hog-raising States.

Mr. McLAUGHLIN of Michigan. In showing the value and result of your work, would it not be well for you to make a comparison with other years, showing what the percentages were in those other years? You say 37 was the lowest. If you give the percentage of loss in other years, that will show it.

Dr. MOHLER. I have a little diagram here. It shows the high points, and here is July 1, 1913, the highest loss in the history of the country, but you see it has come down lower and lower since then [indicating on the chart].

Mr. RUBEY. In 1913, we began this work?

Dr. MOHLER. Yes, sir.

Mr. McKINLEY. What was the per cent in 1913?

Dr. MOHLER. As I recall, it was about 118 hogs per 1,000.

Mr. McKINLEY. And now it is a third of that?

Dr. MOHLER. Yes, sir. From memory I think it is 118 deaths per thousand hogs. Last year it was 42, in 1917 it was 48, and in 1916 it was 66 per thousand.

Mr. ANDERSON. Is not this disease more or less an epidemic disease, and does it not fluctuate very greatly under normal conditions?

Dr. MOHLER. Yes, sir; it is just the same as influenza or any other epidemic.

Mr. ANDERSON. So that the reduction of the percentage of mortality would not be conclusive at all unless it covered a series of years?

Dr. MOHLER. It is not conclusive, but it is strong circumstantial evidence.

Mr. RUBEY. Now you have been working on this since 1913, and you have a yearly record of what has been accomplished and the losses that have been entailed, so that you have a series of years over which you can make comparisons?

Dr. MOHLER. Yes, sir.

Mr. RUBEY. And making your comparison over those series of years, what is your opinion as to this work?

Dr. MOHLER. I believe that the cooperative work of the bureau with the various State and county agencies, and with the farmers themselves, has been largely responsible for holding this disease in check, and that the work should be continued along present lines. Six or eight years ago we could see hog cholera start on a man's farm and from that primary seat of infection scatter around to all the farms in that county and even to adjacent counties and States. Now, I know of a number of States last year that had primary outbreaks on an individual farm, but the outbreak was stopped right there on that farm and not one case of secondary infection occurred on the adjacent farms. I consider that not a case of Providence preventing the epizootic spread of the disease, but I believe it was due entirely to the educational work our cooperating forces are doing. They go right to the farm as soon as they hear of an outbreak, and when that outbreak stops on the first farm in one case after another it certainly is not the result of anything else but the amount of work the inspectors perform with the other farmers in the locality to keep it from spreading to these secondary points. And the holding of the

disease to the primary farm, where the infection first occurred, has been accomplished time and time again in the last two years.

Mr. ANDERSON. I do not want to detract from the value of anything you are doing, but I do not think it is necessary to give the Department of Agriculture credit for increasing the food supply of the country every time it wins.

Dr. MOHLER. No; I would not want to do that, but I am telling you why I consider this work is producing these fine results.

Mr. TINCHER. Is there any locality in the United States where the hog producer can afford to take any chances on cholera?

Dr. MOHLER. Yes, in cases like the gentleman cited yesterday, in Michigan, New York, and Pennsylvania, and places where there is very little hog cholera and little likelihood of having any hog cholera. It would be foolish for him to use the serum and virus on his hogs unless there is some outbreak in the vicinity of his herd. But in your State it is a different proposition.

Mr. TINCHER. You spoke there of vaccinating so many hogs at the stockyard markets.

Dr. MOHLER. Yes, sir.

Mr. TINCHER. There is no market in the United States where you can afford to take stock hogs out without that?

Dr. MOHLER. None at all.

Mr. TINCHER. Every man who purchases stock hogs in the open market knows he can not afford to remove them without vaccinating them against cholera?

Dr. MOHLER. That is true.

Mr. TINCHER. The vaccine is manufactured in all those market centers, is it not?

Dr. MOHLER. True.

Mr. TINCHER. By private companies?

Dr. MOHLER. Yes, sir.

Mr. TINCHER. And those companies are under Government supervision by your inspectors?

Dr. MOHLER. All of them are that do an interstate business.

Mr. TINCHER. And if a man goes to the open market and buys stock hogs he wants to get the serum there to vaccinate them before he takes the hogs away from that market, and they do that at their own expense?

Dr. MOHLER. Yes, sir.

Mr. TINCHER. And the function of the Government is to see that the man who manufactures that serum has complied with the regulations and that the man gets a good serum. There is nothing complicated about administering the serum?

Dr. MOHLER. No. They have local men doing that in all these stockyards and our men are present to supervise the work and see that it is done properly. That is all we do. For instance, we do not approve of a man vaccinating a hog which has a temperature above a certain point, 104, because that animal is apt to be coming down with cholera and if he is vaccinated he will probably die.

Mr. TINCHER. There is no vaccine that is a cure for cholera?

Dr. MOHLER. No, sir.

Mr. TINCHER. It is purely a preventive?

Dr. MOHLER. Purely a preventive; yes, sir.

MR. TINCHER. As you say, in my locality the only safe thing to do when you purchase a hog is to vaccinate him.

DR. MOHLER. That is true. But you can understand in States where they have little cholera present, where there is very little source of exposure, it is not necessary to vaccinate until hog cholera comes somewhere in the vicinity.

MR. TINCHER. I see you have in your report some method of quarantining farms?

DR. MOHLER. Yes, sir.

MR. TINCHER. That method would be a little inconsistent with a vaccine as a preventive treatment.

DR. MOHLER. That is where hogs have contracted cholera and are dying on the farm. We are cooperating with the State. We can not quarantine a farm, but some of our men hold State positions, as State assistants, and they are working as State representatives when they quarantine these farms, so that the animals will be buried or burned and the premises disinfected.

MR. TINCHER. The Government's policy or the Government's theory, or the theory of your department, rather, is, instead of the neighbor insisting on there being a quarantine on that farm, he should use the vaccine?

DR. MOHLER. That is our judgment; and until he does vaccinate his well hogs and burns or buries the carcasses of the dead hogs they will not allow a fellow farmer to come there to visit him, nor is he allowed to visit others. That is the quarantine; the farm is only quantined until the dead animals are disposed of and the premises disinfected.

MR. JACOWAY. Dogs will carry it?

DR. MOHLER. Yes.

MR. JACOWAY. And birds will carry it?

DR. MOHLER. Yes.

MR. JACOWAY. How can you prevent that?

DR. MOHLER. That is one of the serious difficulties we try to overcome.

MR. TINCHER. You do not attempt to prevent that?

DR. MOHLER. No, sir. Once in a while the farmers will try to shoot the pigeons from the neighboring farm or they will shoot their own. But we can not control the birds of the air. The only way to prevent whatever infection they carry from doing serious damage is to have your hogs protected by vaccination.

MR. HUTCHINSON. The person who gathers up garbage in the cities and feeds it to his hogs—I notice they have more trouble from cholera with those people than any place else. That is one of the causes?

DR. MOHLER. That is one of the causes. That has been worked out very nicely in Canada. They found a great many outbreaks were the result of garbage being fed to the hogs.

MR. TINCHER. No man has a right to produce hogs by feeding garbage without immunizing the hogs.

DR. MOHLER. No, sir; that is the solution for it. If a man wants to feed garbage to his hogs, he ought to buy hog cholera serum and vaccinate the hogs to be fed.

MR. ANDERSON. The regulations of serums and toxins relates to other serums and toxins than for hog cholera, does it not?

Dr. MOHLER. Yes, sir; it relates to mallein, tuberculin, abortion vaccines, hemorrhagic septicemia vaccines, etc.

Mr. ANDERSON. The reason I ask the question is because it struck me that the first proviso in this item was rather out of place and, in view of the fact that this proviso covers a whole lot of things other than hog cholera, it ought to be in a separate item.

Dr. MOHLER. The point there, Mr. Anderson, is the greatest volume of the work is done on the hog cholera serum. We have a large number of serum plants under supervision which make only hog cholera serum, 58 this year, while only 30 plants are making solely biological products like mallein, bacterins, and tuberculin. This last group is larger in the quantity of products handled, but smaller in the number of plants.

The next item will be found on page 58, item 67, "for all necessary expenses for the investigation, treatment, and eradication of dourine." I only want to say a few words about that. There has been no request for an increase in the appropriation, but I wish to refer to the progress that has been made.

In the areas in the Central West and Northwest, where work on dourine eradication has been carried on for a number of years, gratifying progress toward the final elimination of the disease has been made. In the State of Iowa eradication has been entirely completed, and in the States of Wyoming, Nebraska, and North Dakota it has been practically completed. While reactors to the test in considerable numbers were found during the past season in Montana and South Dakota, these numbers form a very small percentage of the total number of animals tested in those States. It will be necessary, however, to make further tests of animals in certain regions during the coming season which runs from about April 1 to November 1, and which includes four months of the fiscal year 1921.

In the States of Arizona and New Mexico, where the work was much more recently begun, a large amount of work remains to be done. A comprehensive campaign has been conducted during the past season, during which large numbers of animals were tested, and a high percentage of reactors found, especially in Arizona. Fairly good success was had in accomplishing the destruction of reacting animals. Owing to the nature of the country, however, the great distances from the railroads to the horse ranges, and the fact that most of the animals involved are owned by Indians living under a tribal form of government, the work is carried on under the greatest difficulties, and, as field transportation has to be used extensively, it is relatively quite expensive.

If the advantage gained by the intensive work carried on during the past seasons is not to be lost, it is important that such work be continued. It is hoped that with another season's work the disease will be practically eliminated from the Central and Northwest, but it will be necessary to continue for some time in the two southwestern States named.

With reference to the work done during this period, there were 8,523 horses tested in Montana, with 173 reactors, or 2 per cent. In North Dakota there were 1,372 tested, nine reactors, .6 per cent. In South Dakota, 16,172 horses tested, 105 reactors, .6 per cent. In Wyoming, 830 horses tested, 16 reactors, 1.9 per cent. In Arizona,

14,701 horses tested, with 761 reactors, 5.17 per cent. That is the largest percent of all the States where this disease exists. In New Mexico, there were 3,429 horses tested, with 54 reactors, the per cent being 1.57. That makes a total of 45,027 horses tested, with 1,118 reactors, and an average of 2.4 per cent.

Mr. McLAUGHLIN of Michigan. Have you the percentages for other years, showing your progress? Will you put that in the record?

Dr. MOHLER. Yes, sir. The percentage for the last three years has been a little under 3 per cent. In 1914, 2,550 cases were found; in 1915, 1,515 cases; in 1916, 1,400 cases; in 1917, 1,225 cases; in 1918, 1,018 cases.

Mr. McLAUGHLIN of Michigan. When you find a reactor, what do you do?

Dr. MOHLER. Have him slaughtered, and pay an indemnity of not to exceed \$100 as the Government's share.

Mr. McLAUGHLIN of Michigan. You have not found any way of treating it?

Dr. MOHLER. No, sir.

Mr. McLAUGHLIN of Michigan. You find it principally in stallions?

Dr. MOHLER. Principally in stallions and breeding mares. It is called horse syphilis and only occurs in breeding animals.

Mr. McLAUGHLIN of Michigan. It is spread by the stallions?

Dr. MOHLER. Yes, sir. Our results this year would be a great deal better if it were not for the numerous nests of disease we found on the Indian reservations in Arizona. Out of 14,701 animals tested in that State we found 5.17 per cent reactors.

Mr. McLAUGHLIN of Michigan. Do the Indians raise the kind of horse that is sold elsewhere than where it is raised?

Dr. MOHLER. No; and they have hundreds of horses for each Indian, where they only need to have four or five. We hoped when this meat inspection for horses was established they would dispose of a lot of horses for slaughter, and no doubt that will occur before another year rolls around; but there has scarcely been time since the first of July, the date that law went into effect.

Mr. McLAUGHLIN of Michigan. The horses from the Indian reservations are not apt to reach the other sections of the country?

Dr. MOHLER. No, sir.

Mr. McLAUGHLIN of Michigan. And there is not likely to be much communication of the disease from that source?

Dr. MOHLER. No, sir; and those sections are quarantined by the States so there is no possibility of the horses getting away. Our greatest difficulty is to get the Indians to round them up. We have to go there in the round-up season, and it is very hilly ground, so you never catch 100 per cent of the animals you go after. If you leave one infected stallion behind he may serve fifty or 60 mares during the next season, and the next year you find all of those mares with the disease.

The CHAIRMAN. We started the appropriation for this purpose in 1918 with the view of stamping it out and solving the problem quickly.

Dr. MOHLER. Yes, sir; \$100,000 was first appropriated. And last year we asked to have a reduction made of \$8,000, and that was done.

The CHAIRMAN. You started with \$99,000, and now we are only down to \$85,000.

Dr. MOHLER. Yes, sir.

The CHAIRMAN. I thought you might reduce this materially from year to year, and that by this time we would not be called upon for an appropriation.

Dr. MOHLER. We could have expected a reduction had it not been for these numerous nests of disease found in Arizona. We have got some hard work before us there and we would scarcely expect a further reduction of this appropriation if we are to get through with this disease in the next few years.

The CHAIRMAN. It is absolutely necessary to have the full amount?

Dr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. Does that disease prevail in Mexico?

Dr. MOHLER. In old Mexico?

Mr. McLAUGHLIN of Michigan. Yes.

Dr. MOHLER. No, sir; not so far as we know.

Mr. McLAUGHLIN of Michigan. Not so far as you know?

Dr. MOHLER. You know live-stock sanitary work down there is on a very low level; we do not know much about what they have down there except by carefully inspecting the animals which are imported into this country.

The CHAIRMAN. You want to give special attention to Montana and what other State?

Dr. MOHLER. We want to give special attention to Arizona and New Mexico. Montana only had 173 cases, and North Dakota only nine.

Mr. LEE. Have you made good progress in those States?

Dr. MOHLER. Yes, sir. As I said before, we will clean up most of the Northwestern States in another year's work. If we could go into those States and round up 100 per cent of the horses, we could clean up all of them in one season, but we never get a round-up of 100 per cent; and if we leave one stallion behind you have 50 or 60 mares, or more, served by him, which will be diseased the next year.

Mr. McLAUGHLIN of Michigan. And the foals, too?

Dr. MOHLER. Yes, sir; very often.

Mr. PURNELL. Have you found any of the disease farther east than—

Dr. MOHLER. We have never found it farther east than Illinois. We had an outbreak in Illinois in 1888, and then it was carried by one stallion from Bloomington, Ill., to Rushville, Nebr., and thence to the Pine Ridge Reservation, where it took 14 to 15 years to eradicate. That country is clean now. It broke out again in Montana, and in those days you had to use the naked eye to discover the disease. To-day, as a result of the investigational work done by the bureau we have a blood test, which we use on about 45,000 samples yearly. Our inspectors take probably an ounce of the blood of those horses to be tested, and the samples come into the Washington laboratory, where inside of 12 hours we can tell whether the animals are infected or not. If we had the old method, we would have to wait until the disease developed clinical symptoms, whereas now we catch most of the cases in the earliest or incipient stage.

Mr. McLAUGHLIN of Michigan. Is that the way they test the animal now?

Dr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. And you kill the animal if the test discloses the presence of the disease?

Dr. MOHLER. Yes, sir. It usually shows clinically in the genitals of the mares and stallions, sometimes only in the testicles of the horse, but if we have any doubt about the diagnosis, we make a blood test, and if from the blood test we detect the disease, the animal is killed.

Mr. McLAUGHLIN of Michigan. Do you make a post-mortem examination to see if your test is verified?

Dr. MOHLER. Yes, sir. This test is very similar to the Wassermann reaction in syphilis of man.

The CHAIRMAN. This is a 50-50 proposition?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. And it is only done by voluntary arrangement?

Dr. MOHLER. Yes, sir; and we do not pay more than \$100 for any animal.

The CHAIRMAN. \$100 is paid by the Government or by the two?

Dr. MOHLER. No, sir; \$100 is the maximum paid by ourselves.

The CHAIRMAN. That is, \$200 a head?

Dr. MOHLER. Some States pay a great deal more. North Dakota pays a very high price in some cases, because they have got a good many pure-bred Percheron horses in North Dakota.

The CHAIRMAN. Is that an arbitrary figure?

Dr. MOHLER. Yes, sir; it is an arbitrary figure.

The CHAIRMAN. You enter into an agreement?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. You have no trouble about that?

Dr. MOHLER. No, sir; no trouble at all. Of course, we do not have to use that maximum for the mustangs and bronchos; we can get along with from \$25 to \$40 in the appraisements there.

The CHAIRMAN. What is the next item?

Dr. MOHLER. The next item is number 69, on page 60, "For additional expenses in carrying out the provisions of the meat-inspection act of June 30, 1906." This item is the one that carries a supplementary appropriation for the meat-inspection service in addition to the regular appropriation of \$3,000,000 provided in the acts of June 30, 1906. What we ask for here is to have the phrase inserted, "including the purchase of tags, labels, stamps, and certificates printed in course of manufacture," the idea being to obtain permission to purchase these labels, certificates, tags, and stamps in the open market instead of having to go to the Government Printing Office. We have always found it took a great deal of time to get these supplies from the Government Printing Office, and their bid was always higher than the outside bids had been. We think it is desirable to be given the privilege of buying these things in the open market, and the language suggested is identical to that giving similar authority to the Treasury Department for buying like supplies.

Mr. ANDERSON. What do the words "printed in course of manufacture" mean?

Dr. MOHLER. Take, for example, the Denison tag which contains the words "U. S. Retained" or "U. S. Condemned," for our meat-inspection work. These words are printed on the tags in course of their manufacture. I have never seen them make those tags; but

you know the Denison tag, do you not, Mr. Anderson? We require the words "U. S. Retained" to be printed on certain kinds of these tags, and other tags are marked "U. S. Condemned," and they are all printed in the course of manufacture. They are printed before they put in the eyelets on one end of the tags and before they tie the strings to them.

Mr. RUBEY. You mean while they are manufacturing these tags, the printing is put in there?

Dr. MOHLER. Yes, sir; the printing occurs before the tag is completed, before the eyelet is put in and the serial number given.

Mr. McLAUGHLIN of Michigan. Why don't you make the packers pay for these tags; they are put on their stuff?

Dr. MOHLER. Yes; but it is our only means of identification. If we allow the packers to control the retained tags and the condemned tags, it would be the worst thing possible. Those are supplies we want to keep under our own lock and key.

Mr. McLAUGHLIN of Michigan. You could have the control of them; they would simply comply with your order.

Dr. MOHLER. I think anything that has to do with the retention or condemnation of meat ought to be absolutely in the hands of our inspectors without any control by the packers in any sense of the word.

Mr. MCKINLEY. How much do these tags cost per year?

Dr. MOHLER. \$5,000 or \$6,000. It is a very small amount. This new language is added in view of the difficulty we have in obtaining promptly supplies of this character from the Government Printing Office, which apparently is not properly equipped for this sort of manufacture. The language of recent enactments relative to printing, strictly construed, prevents the departments from securing such supplies from any other source than the Government Printing Office, except with the previous consent of the Joint Committee on Printing. We have had the consent of the Joint Committee on Printing to get this work done on the outside up to the present time, but what we want to do is to have it in the law so that every time we want \$1,000 worth of retained tags, stamps, or labels we won't have to go to the Joint Committee on Printing for permission.

Mr. McLAUGHLIN of Michigan. How much does it cost to get a supply at the printing shops?

Dr. MOHLER. Less than half the cost at the Government Printing Office. They are not fitted up with the machines for putting the eyelets and things of that kind in the tags, like the Denison people and some of these other manufacturers.

Mr. MCKINLEY. Is that true of all things?

Dr. MOHLER. No, sir; not at all.

Mr. MCKINLEY. How does it compare with the open market?

Dr. MOHLER. I would not want to say, but I know the open market is cheaper on special lines.

Mr. JACOWAY. But on this item, if you were allowed to go in the open market, you would save between \$2,500 and \$3,000?

Dr. MOHLER. Yes, sir; we could.

Mr. ANDERSON. I notice you have eliminated some of the language of the bill of last year. The question in my mind is whether the language which is now left is sufficient to cover equine investigations?

Dr. MOHLER. We have asked for the elimination of that particular phraseology, because we consider it unnecessary.

Mr. ANDERSON. The legislative part of it is unnecessary, but I am afraid there is no authority in the language left to carry on the equine inspection or to pay for equine inspection.

Dr. MOHLER. This suggestion was brought up by the legal members of the department, and they considered it merely complicated the accounting and was unnecessary. I do not recall the language in last year's bill about equine inspection.

Mr. HARRISON. Perhaps the situation Mr. Anderson has in mind would be met by leaving out the words "by the act of March 4, 1907."

Mr. ANDERSON. Or by including the act of last year.

Mr. HARRISON. The simplest way would be to strike out "by the act of March 4, 1907."

Mr. ANDERSON. My impression is that this equine provision you had last year is not specifically indicated as an amendment of the meat-inspection act. But we can go into that matter later on.

Mr. RUBEY. How many applications have you had for the use of this horse-meat inspection?

Dr. MOHLER. We have had about five or six applications. There is one plant now in Cincinnati where we are inspecting horse meat, and they are shipping all their products to Holland.

Mr. McLAUGHLIN of Michigan. It is all shipped abroad, is it not?

Dr. MOHLER. Most of it; yes, sir. At the present time there are a number of firms that have requested information, and are getting ready to start inspection. The Hudson Bay Co. is interested in two or three plants in the West, and their representatives are now in France, Holland, and Belgium getting orders for, I think, 30,000 pounds a week—quite a large supply. The trouble now is the rate of exchange. That is holding up this business. They are going to see if they can not supply the horse meat from this country and have those countries supply olive oil or other product laid down to them in New York. They are trying to provide for a system of bartering instead of an outright sale. The rate of exchange is stopping this horse-meat business more than anything else.

Mr. McLAUGHLIN of Michigan. That applies to everything?

Dr. MOHLER. Yes, sir. The Hudson Bay Co. is deeply interested, and they are contracting with plants for this purpose.

Mr. CANDLER. Horse meat is used only for export; it is not used in this country, at all?

Dr. MOHLER. It is used a little in this country. They have a Federal plant at Cincinnati, and there are local plants at St. Louis, Milwaukee, Portland, Oreg., etc., where they sell horse meat locally.

Mr. WILSON. How do you like it?

Dr. MOHLER. I have eaten some samples of dried beef and Salami sausage, produced in Wisconsin, and I had hoped to be able to bring some samples of them here, but Mr. Chappel, who promised these supplies, is now in France getting orders.

Mr. RUBEY. It might be a good idea to furnish us with some of the meat, and not to let us know what it is until after we have tried it.

Dr. MOHLER. You would not hesitate to eat it after you had tasted a sample, because it is very good.

Mr. McLAUGHLIN of Michigan. Is that Hudson Bay Co. a Canadian company?

Dr. MOHLER. It is the old Hudson Bay Co. of Cooper's tales. Their head office is at New York City.

Mr. JACOWAY. What is this horse meat worth a pound?

Dr. MOHLER. In New York, when they were selling it a year or so ago, it was 15 and 18 cents a pound. Horse steaks were selling for 18 cents.

The CHAIRMAN. How does the price compare with other meat?

Dr. MOHLER. At that time it was over 50 per cent cheaper than beef.

The CHAIRMAN. How does the price of the horse compare with the price of cattle?

Dr. MOHLER. I met a number of Montana horsemen at the international convention in Chicago, last week, and they were bemoaning the fact that these horse-meat dealers were not taking their horses; that the horses were in a sleek condition, and they were willing to sell a number of them at \$25 a head. They were afraid, if they had to winter them, that next spring they would be very thin, and these horsemen were very much upset about the failure of the exporters to take the horses off their hands.

The CHAIRMAN. They have a number of plants slaughtering for local consumption?

Dr. MOHLER. Yes, about five or six; but there is only one (Cincinnati) that has Federal inspection.

The CHAIRMAN. There is one in Milwaukee?

Dr. MOHLER. It is not under Federal inspection.

The CHAIRMAN. Are there any under Federal inspection?

Dr. MOHLER. In Cincinnati; yes, sir.

Mr. JACOWAY. Is it not about 200 per cent cheaper than beef?

Dr. MOHLER. At the time I mention, beef was selling about 40 cents and they were selling horse steaks for 18 cents.

Mr. JACOWAY. They are not selling here for that.

Dr. MOHLER. Not here. I am talking about New York City now—Brooklyn.

Mr. JACOWAY. I do not think they were in New York City. I think you are in error about it.

Dr. MOHLER. I think Mr. Rommel had one of our men go up there, and was not that his report?

Mr. ROMMEL. Yes.

Mr. TINCHER. He must have gotten a wholesale price on beef.

Dr. MOHLER. This was a year or a year and a half ago. This inspection requirement has been effective only since July, you know, and none of those fellows could have inspection unless they adopted our requirements. This firm in Brooklyn I am speaking of has not met all the requirements.

Mr. TINCHER. Is there any requirement about the condition of the horse?

Dr. MOHLER. Oh, yes. He has to be inspected, antemortem and post-mortem both, the same as the cow, sheep, and hog.

Mr. JACOWAY. You can not get a steak for 50 cents or a roast for 50 cents here and have not been able to do it in the last year and a half. And, as I understand it, the price here is somewhat parallel to the price in New York City.

Dr. MOHLER. I have paid as high as 62 cents for a steak here and as low as 40 cents, in the last year and a half.

Mr. JACOWAY. That would make your percentage wrong. You say about 50 per cent; that would be 150 per cent.

Dr. MOHLER. We are figuring differently. I am using the price of beefsteak as a 100 per cent basis, while you are taking the price of horse steak for your basis of 100 per cent.

Mr. CANDLER. All this horse meat is required to be stamped?

Dr. MOHLER. Yes, sir; with a green branding ink.

Mr. McLAUGHLIN of Michigan. Do you know anything about the whale meat supply and whether it is used in this country?

Dr. MOHLER. No, sir; I do not. The Bureau of Chemistry has been doing some work with the fish foods. We have not been doing anything on that at all.

The CHAIRMAN. Is there anything else?

ERADICATION OF FOOT-AND-MOUTH DISEASE.

Dr. MOHLER. There is only one other item that comes under the Bureau of Animal Industry, and that is the continuation of the insurance fund for a possible outbreak of foot-and-mouth disease. That is in your bound copy, over in the back of the book.

Mr. HARRISON. Page 281, item No. 8.

Dr. MOHLER. Comparatively small sums have been expended in maintaining a vigilant lookout for symptoms of foot-and-mouth disease among all susceptible animals received at public stock markets. At all the central markets where the disease has existed and in trade channels through which it has been spread in previous outbreaks experienced veterinarians are stationed especially for work under this project. The number of such employees has been increased during the past year because of the possibility of infection being introduced through the return of American forces and material from allied countries in Europe in which the disease prevails. Extra precautions have been and are being taken because of this possibility. All suspicious cases of disease among susceptible animals anywhere in the United States, which come to the knowledge of the bureau, are promptly investigated.

In this connection, I want to say that at the present time there is more foot-and-mouth disease in southern France, Italy, Switzerland, Belgium, Holland, and England than has existed for the last 15 years.

Mr. McLAUGHLIN of Michigan. Is there any alarm felt about it in this country; have there been any scares?

Dr. MOHLER. There have been some scares, but investigations have proved them without any foundation.

Mr. PURNELL. This is an outgrowth of the war?

Dr. MOHLER. Yes, sir. These outbreaks in England have been accounted for by the sanitary authorities of Great Britain largely as a result of the return of the soldiers from France who bring in the infection.

Mr. PURNELL. How can they transmit that?

Dr. MOHLER. They bring it home on their shoes, clothing, gloves, or on souvenirs they pick up around the barnyards, on helmets, and things of that kind; it is impossible to say what particular thing, but all those things are potential means of carrying the disease from France to England.

Mr. McLAUGHLIN of Michigan. And you are afraid of that?

Dr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. Do you know of any cases where the infection has come into this country in that way?

Dr. MOHLER. No, sir.

Mr. McLAUGHLIN of Michigan. But the men have been back long enough now so that if they brought any of it with them, it would show up by now?

Dr. MOHLER. Yes. I think the cootie helped as much as anything else in preventing us from having foot-and-mouth virus brought in, because the soldiers were disinfected before they embarked on the other side, their clothing was taken off, disinfected and washed in antiseptic solution, and then when they got on this side they were treated in the same way. I think the fact that they were so well disinfected to get rid of the cootie, helped us considerably in not having any outbreak from the virus of the foot-and-mouth disease that might have been carried on their clothing and other materials.

Mr. PURNELL. That is what I mean. What I was trying to ascertain was whether or not there was any evidence of that disease; whether you found any evidence of that disease in this country and had traced it to the soldiers.

Dr. MOHLER. No. There has been no case of foot-and-mouth disease in this country since the last outbreak, which was eradicated in the spring of 1916.

Mr. McLAUGHLIN of Michigan. You spoke of the increase in France and England. What is the percentage of increase; has it been large?

Dr. MOHLER. In the latest French magazines, I see that the minister of agriculture of France has pronounced it as an epizootic in southern France, in the Marseille section, and I saw a letter from Sir Stewart Stockman, of Great Britain, a few weeks ago, saying it was quite serious in England on account of the mysterious occurrence of those outbreaks.

Mr. McLAUGHLIN of Michigan. There was some talk when this outbreak of 1916 occurred that it was brought in in hides from Argentina and Venezuela—or where was that?

Dr. MOHLER. From South America. That was because the first case occurred in Niles, Mich., not very far from a tannery located in that town; but absolutely no connection could be established between the hides there and the outbreak.

Mr. McLAUGHLIN of Michigan. Have you determined in your own minds where it came from?

Dr. MOHLER. No, sir. There was no satisfactory explanation.

The CHAIRMAN. What is the amount of the unexpended balance of the two million and a half?

Dr. MOHLER. About \$514,000. Last year we expended about \$45,000 in looking up these reported cases and in having men at the stockyards looking for this particular trouble.

The CHAIRMAN. How much did you spend of this \$1,000,000 last year?

Dr. MOHLER. Not a cent. We have not spent any of that in any year since it was included in the bill.

The CHAIRMAN. You draw on that \$2,500,000 all the time?

Dr. MOHLER. Yes; and the \$1,000,000 is to be spent only in case of an outbreak. That is an insurance fund in case an outbreak occurs at some time when Congress is not in session.

The CHAIRMAN. At the same time, you spend some money?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. So that you have spent thus far about \$2,000,000 of the \$2,500,000?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. That is the only money appropriated?

Dr. MOHLER. Yes, sir; and most of that was used in the purchase of the affected and exposed cattle during the last outbreak four years ago.

Mr. TINCHER. You never spent any money better than that?

Dr. MOHLER. No, sir.

The CHAIRMAN. How much did you spend last year?

Dr. MOHLER. \$45,499.27. That leaves a balance of \$514,000 of that original \$2,500,000 appropriated about four years ago.

The CHAIRMAN. Is that for the current year?

Dr. MOHLER. That is for the fiscal year just past, you know. I mean the last fiscal year; we spent that for the fiscal year 1919. That leaves \$514,000 as the balance.

The CHAIRMAN. How much have you spent this year?

Dr. MOHLER. I do not have an account of that expense with me. There has not been much spent except the salaries of these men at the stockyards and the investigation of two or three scares.

The CHAIRMAN! It will probably be about the same?

Dr. MOHLER. Probably about the same, unless numerous scares come in. We have to send men a good many miles sometimes when there has been a report of a foot-and-mouth outbreak at some remote point.

Mr. McLAUGHLIN of Michigan. Have you a memorandum of the number of men employed on this particular work?

Mr. MOHLER. Yes, sir.

Mr. McLAUGHLIN of Michigan. Have you in mind how many there are?

Dr. MOHLER. No; I have not the full data here. We always send our most experienced men. For instance, the last scare we had was a reported outbreak of foot-and-mouth disease in southern Illinois. We had an expert in Chicago, so instead of sending a man from the nearest point to southern Illinois, which would have been East St. Louis, we took the expert from Chicago and sent him a couple hundred miles to investigate that report. We think it is better to send a man that extra distance who knows the disease rather than to use a man, only 25 miles away, who has not so much experience.

The CHAIRMAN. I take it all your veterinarians are on the lookout for this?

Dr. MOHLER. Yes; they are. But we have some who are more experienced than others.

Mr. McLAUGHLIN of Michigan. The man in Chicago is engaged on the work regularly?

Dr. MOHLER. Only when an investigation in that zone is required, and all we charge against the foot-and-mouth fund is for his time and trip. The point I am trying to make is the department has a

man at the East St. Louis stockyards, 25 miles away, but his judgment would not have been as good to me as the judgment of the experienced man in Chicago, who has gone through all these outbreaks from 1902 on. I always try to get the best judgment of the best man in these cases.

The CHAIRMAN. You do not employ anybody for this service?

Dr. MOHLER. At all the important stockyards we have one man employed from this particular fund.

The CHAIRMAN. Only one man employed permanently?

Dr. MOHLER. One man employed permanently at each of the stockyards.

The CHAIRMAN. At how many stockyards?

Dr. MOHLER. About 27.

Mr. RUBEY. He does not do this work alone?

Dr. MOHLER. Oh, no.

Mr. WILSON. In this meat-inspection service have you any unexpended money for the salaries of the meat inspectors that you have not used?

Dr. MOHLER. Money that was appropriated last year for promotions?

Mr. WILSON. Yes.

Dr. MOHLER. No, sir; every penny of that has been used up.

Mr. WILSON. I am glad to hear that because I think there ought to be something done. I know of some of the meat inspectors, in some of our larger cities, at least, because I hear so much about them, who are practically destitute.

Mr. McLAUGHLIN of Michigan. You and Mr. Rainey got everything there was.

Mr. WILSON. We did not get enough.

Mr. McLAUGHLIN of Michigan. You got it all nailed down.

Mr. RAINEY. The whole morning and part of yesterday has been taken up with the discussion of the eradication of tuberculosis in cattle, in sheep, in horses, in hogs. Now, we just ought to stop here for a moment and find out if we can not eradicate a little of the tuberculosis in a few human beings who are working for the Government in the Bureau of Animal Industry. Last year, in the general appropriation, this committee allotted \$120 increase to the veterinarians and inspectors, but they did not allow it to the clerks, to the girls employed in the department who assist the veterinarians in the various offices scattered through the various stockyards throughout the country. I understand the ruling of the Secretary was they had no appropriation for them and therefore could not allow them an increase. And right on this point, I want to call the attention of the doctor and to serve notice on the subcommittee that when the time for it to consider this comes I shall be delighted to ask the privilege of appearing to ask that the clerks be granted the increase of \$120. I think there are about 250 clerks; is that correct?

Dr. MOHLER. Two hundred and fifty, about.

Mr. RAINEY. Who would be entitled to that? That would amount to about \$30,000 for human beings, many of them probably with families and large families, to prevent not only tuberculosis in those families but in their children. That is of paramount importance. That is No. 1. I think the animals are secondary. The second thing I want to call the doctor's attention to is this, that in the Bureau of

Animal Industry you have grade No. 1 and grade No. 2 lay inspectors. There are a number of those grade No. 2 lay inspectors that receive about \$1,500 a year. Is that correct, Doctor?

Dr. MOHLER. A very few. Most of them receive only \$1,320.

Mr. RAINEY. There are a number that receive \$1,500?

Dr. MOHLER. Yes; there are some.

Mr. RAINEY. I think there are about 600 grade No. 2 inspectors that receive \$1,320 a year that have been in the service for over five years. Now, there is dissatisfaction among those men. They are working alongside of men receiving \$1,500 doing the same kind of work, and they are receiving only \$1,320. Let me cite a practical illustration. A fellow out in the stockyards by the name of Jack Murphy has been with the Government for 28 years. He is at present out in the hog department in the stockyards proper. Jack Murphy has trained most of the veterinarians and most of the grade 1 inspectors that have been brought into the stockyards. He is a fellow who knows the business thoroughly; he has the confidence of all the men there, and he is only getting \$1,320 a year. Now, there is no chance, according to some system or method of procedure of the department, for him to be advanced to \$1,500, other than certain marks that they give, a sort of civil-service requirement of efficiency. Now, Jack may not have the intelligence to pass an efficiency examination, but I will say to Dr. Mohler, Mr. Harrison, and Mr. Houston that Jack Murphy can go to any packing house in the country, alongside of any veterinarian, with the exception of the distinguished Dr. Mohler here, and Kiernan, and some of the scientific gentlemen (who I also insist are greatly underpaid), and Jack Murphy can do as efficient work as anybody out in the stockyards, and he is only getting now \$1,320 a year.

I do not think it is the object or the desire of this committee to appropriate \$2,500,000 for the eradication of tuberculosis in cattle and appropriate \$1,000,000 for viruses and these other ingredients to prevent this disease in animals and neglect the men carrying on this inspection work.

Mr. McLAUGHLIN of Michigan. He is one of the large number of second-grade inspectors?

Mr. RAINEY. Yes.

Mr. WILSON. And there are a lot more just like Jack Murphy.

Mr. RAINEY. Yes.

Mr. WILSON. And men with large families. This Jack Murphy you are speaking of raised a large family and raised them well, and they have to struggle to get along.

Mr. McLAUGHLIN of Michigan. Is there not some way, after a certain length of time, and they show their capacity, by which that man can be passed to first grade?

Dr. MOHLER. Mr. McLaughlin, our grade 2 is really the first grade so far as quality and technical experience are concerned. Jack Murphy is one of a large number, and to promote them all will require a large sum of money, which I would be very glad to see appropriated. They were all promoted last July, of course, as a result of the effort of some of the members of the committee, Mr. Rainey and others, but the amount was very small compared with the importance of their activities and the increased cost of living.

Mr. McLAUGHLIN of Michigan. How much?

Dr. MOHLER. \$120 per annum.

Mr. RAINEY. Previous to that they were getting \$1,200. Here is the idea: I think after a certain length of time, if a man has been in the department for five years, working alongside of another fellow getting \$1,500 a year, and especially doing the same kind of work, both being capable, they both ought to be entitled to the same salary. If the man is not as efficient as the man getting \$1,500 a year, then he ought to be discharged. I have called this to the attention of Mr. Harrison, and Mr. Harrison said that it takes so much time and red tape to discharge them, and there should be permission given to the department, after they have served a certain apprenticeship and show ability for this particular kind of work, to pay them the same amount of salary as the man working alongside of them and receiving \$1,500.

Mr. McLAUGHLIN of Michigan. What is the title of the man working alongside of them and receiving \$1,500?

Mr. RAINEY. He is grade 2.

Dr. MOHLER. No; a veterinary inspector.

Mr. JACOWAY. Won't that be worked out in the work of the Reclassification Commission?

Mr. RAINEY. No; the distinction there is, if you delay until the Reclassification Committee takes it up, it will start out on the basis of \$1,320, and the fellow would still not have the same opportunity as the fellow getting \$1,500. I think it ought to be ironed out and they ought to be put on a par now, and then let the Reclassification Commission handle it altogether.

Mr. McLAUGHLIN of Michigan. What would be the objection to putting them all on a par? You speak of Mr. Murphy being particularly efficient.

Mr. RAINEY. I just happened to run across him.

Mr. McLAUGHLIN of Michigan. There are others?

Mr. RAINEY. A great number.

Dr. MOHLER. That is right.

Mr. McLAUGHLIN of Michigan. Who are unusually efficient as compared with the large number that are employed? Why would it not be well to create another grade and to select those like Mr. Murphy and to put them in that other grade, with a proper increase in salary, and not to increase them all? Perhaps some of them, a great number of them, do not deserve it as Jack Murphy does.

Mr. RAINEY. The reason I cite Jack Murphy's case in particular, is that I go out in the stockyards occasionally, and I met this man one day at the stone gate and began to discuss the question of salary with him. He told me the length of time he had been there, about 28 years, and how much he was getting, and then I inquired of others out there about Jack Murphy and his efficiency and found he was considered by a number of men out there as one of the best men they have.

Mr. McLAUGHLIN of Michigan. It looks to me like there ought to be a regrading and perhaps another class created.

Mr. TINCHER. Perhaps a class 2-A.

Mr. HUTCHINSON. You say this man, Jack Murphy, taught these veterinary inspectors?

Mr. RAINEY. When they first come out of college they are just theorists.

Mr. HUTCHINSON. But they have to go through a course of study?

Mr. RAINEY. Oh, yes; I do not wish to disparage the ability of those men.

Dr. MOHLER. This man is a very good practical man and knows the hog business from a to z, and also all the commission men. You and I could go into the yards and on the first day we would have to be shown by somebody the rules of the game, how the hogs are unloaded at the docks, how they are brought to the scales, and how purchases are made, and things of that kind.

Mr. HUTCHINSON. Why could he not go through some school as a man who is given a course of study?

Dr. MOHLER. A great number of lay inspectors have done so and become veterinary inspectors.

Mr. JACOWAY. Can you not work it out along the line suggested by Mr. McLaughlin, of making another grade?

Dr. MOHLER. We could if we had the money, but we have not the money to do it.

Mr. JACOWAY. How much more money would it take? Mr. Rainey estimated \$30,000.

Mr. RAINEY. That is for the clerks—these girls and men.

Mr. JACOWAY. About how much would it take?

Mr. RAINEY. There are 600 men, approximately, who have been in the department for more than five years, receiving only \$1,320. To raise them all it would approximate about \$140,000; from \$140,000 to \$150,000. To grade them according to Mr. McLaughlin's suggestion it would not take that much. About \$100,000, do you think?

Dr. MOHLER. That would help a great deal, of course.

Mr. McLAUGHLIN of Michigan. The good man ought to be raised, but in every bunch like that, 600 of them, there are a lot who just travel along with no particular efficiency and who are not deserving of an increase. I believe in giving an increase to those who deserve it, and it might be done by creating another grade, to which these deserving ones can be elevated.

Mr. RAINEY. Will you work out some suggestion along that line, Doctor, keeping in mind a \$100,000 increase?

Dr. MOHLER. We will see that the deserving men get it if we receive the \$100,000. We could establish a subdivision of grade 2.

Mr. WILSON. Let us know how much it will take, whether it is \$100,000 or some other amount.

Mr. McLAUGHLIN of Michigan. There are always in a bunch like that some who are efficient and some inefficient workers, and there is a lot of injustice done.

Dr. MOHLER. There is no question about that.

Mr. JACOWAY. Who would say they are efficient and ought to be promoted?

Dr. MOHLER. We have to depend solely on the decision of the inspector in charge where these men are working.

Mr. WILSON. You have a record of the men?

Dr. MOHLER. We have a record, and we divide them into classes A, B, C, and D. The class A men are those who should be promoted at once; the B men are those doing good work and should be promoted at the average rate; the C men are those fellows who are just getting by; and the class D men are the fellows who should be dismissed or demoted.

The CHAIRMAN. How many clerks would be affected by the suggestion of Mr. Rainey? They are the clerks outside of Washington?

Dr. MOHLER. Yes. They include only the meat-inspection clerks and are about 250 in number.

Mr. HUTCHINSON. Why draw the line on the meat-inspection clerks?

Dr. MOHLER. There would be quite a discrimination against the clerks in the tick-eradication service, the hog-cholera work, the virus and serum offices, and the other divisions if you did not include them also.

Mr. HARRISON. The question also arises as to whether it would be desirable to consider only the clerks in the Bureau of Animal Industry. There are a number of employees in other branches of the department in essentially the same situation. If you will glance through these estimates you will see that a number of laborers at \$540 and \$600 a year are provided for. How can they exist, much less live, on such salaries? I do not want the committee to get the impression that the situation to which Mr. Rainey refers exists only in the Bureau of Animal Industry or only in the meat-inspection service of that bureau. If the employees of these branches are to be considered, the employees of other bureaus ought not to be overlooked.

The CHAIRMAN. How many clerks are employed outside of Washington who would be affected by this?

Dr. MOHLER. In the meat-inspection work, there are about 250 that would be covered.

The CHAIRMAN. Employed at the various markets?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. How does that salary compare with the salary paid here in Washington?

Dr. MOHLER. It is a little bit lower.

The CHAIRMAN. How much lower?

Dr. MOHLER. About \$200.

The CHAIRMAN. \$200 a month?

Dr. MOHLER. No; a year.

The CHAIRMAN. And they get the benefit of the bonus?

Dr. MOHLER. Yes, sir; they all get the benefit of the congressional bonus.

The CHAIRMAN. The same bonus that is paid here?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. They get about \$200 less; why the discrimination?

Dr. MOHLER. We try to select the outstanding clerks, the best equipped, the highest type field clerks, and bring them into Washington. If we learn of such \$1,200 clerks in Mississippi or Texas we try to bring them in here if we can, and naturally we give them a \$200 increase if there is such a vacancy.

The CHAIRMAN. Are we to understand these clerks are less efficient than those employed here?

Dr. MOHLER. No; but we have a higher average of efficiency in our Washington offices. I am speaking about the average. We have some very fine clerks in all these outside positions.

The CHAIRMAN. You are speaking of the clerks?

Dr. MOHLER. Yes, sir. The average skill of the clerks here in Washington, due to their more varied and longer experience, is higher than the average of the clerks in the field. That is because,

as I said before, we try to select the outstanding clerks in the field positions and bring them into Washington if we can get them to come. Some of them prefer to stay in their home towns, and therefore we have a number of exceptions to the average I am speaking of.

The CHAIRMAN. You take into consideration the cost of living?

Dr. MOHLER. Yes; somewhat.

The CHAIRMAN. They can live cheaper in their homes than by coming to Washington.

Dr. MOHLER. We consider there is a much higher living cost in Washington than on the outside where most of our men are located.

The CHAIRMAN. But that would not apply to all the plants in all the cities? It would cost as much to live in Chicago as it does to live in Washington?

Mr. RAINEY. I do not think so. We can live in Chicago much cheaper. I make that statement because of my experience here for a couple of years. But the distinction of Dr. Mohler about the better caliber of the clerks in Washington, those they can attract to come to Washington, they may come so as to be at the seat of the National Capital, and they are willing to work here for a few years to see Washington and its environments and to get acquainted with its historic spot; while back in Chicago the little boys and girls do not want to leave their home environment and they stay at home and are willing to work back there for \$1,200 a year where they would probably have a more lucrative stipend if they came to Washington. Now all we ask is that the efficient clerks out there receive \$10 a month increase the same as was granted to the lay inspectors and veterinarians a year ago.

The CHAIRMAN. The doctor says they pay \$10 a month less because it costs \$10 less a month to live there.

Dr. MOHLER. That is not the only thing, by any means.

The CHAIRMAN. If that is true, then they are receiving as much as the others, are they not?

Dr. MOHLER. Probably, considering the difference in the cost of living. We have men who prefer to go back to their homes and take less money. For instance, we had a man not long ago who went back to Chicago and was willing to go for \$200 less rather than to stay in the city of Washington. And we had a similar case recently, where the man went back to Philadelphia at a salary of \$1,500 when he was getting \$1,600 here. The position in Philadelphia only paid \$1,500, but he was willing to be reduced \$100 in order to get back home.

The CHAIRMAN. And you take into consideration the service rendered?

Dr. MOHLER. Yes, sir.

The CHAIRMAN. How does the service rendered there compare with the service rendered here? Does the difference in the cost of living here counterbalance the other?

Dr. MOHLER. The average training of the clerks in our Washington offices is greater than the average training of the clerks in the field, and therefore they ought to be paid more, irrespective of the cost of living. Their responsibilities are greater; they have greater opportunities to show ability than they do in some of the field stations, and it is harder work of a more varied character.

The CHAIRMAN. Then, according to your statement, the increase would not be justifiable?

Dr. MOHLER. I want to see them all increased; I think they should all be increased.

The CHAIRMAN. Unless they all are increased, there would be no justification?

Dr. MOHLER. I think it would be an injustice to the clerks in the other divisions of the bureau to have the clerks in the meat-inspection service increased and they be left out.

The CHAIRMAN. I did not catch that.

Dr. MOHLER. I say I think it would be an injustice to have the clerks of one division promoted and leave out the clerks in the other divisions—the Dairy Division, the Animal Husbandry Division, the Tuberculosis Eradication Division, etc. All these clerks are on the statutory roll and the clerks in these other divisions can not be cared for from the lump funds as they could if they were professional or technical employees.

Mr. TINCHER. How do the salaries compare with the clerks in the Post Office Department?

Dr. MOHLER. I am not familiar with the salaries paid in the Post Office Department.

Mr. WILSON. It is less—very much less.

The CHAIRMAN. You make some distinction between the veterinarians and the other employees you have?

Dr. MOHLER. Those lay inspectors are technical men, experienced in live stock and the handling of meat.

The CHAIRMAN. They are not veterinarians?

Dr. MOHLER. No, sir; they are technical lay inspectors.

The CHAIRMAN. They have different salaries?

Dr. MOHLER. Yes, sir.

Mr. RAINEY. The veterinarians start in at \$1,500?

Dr. MOHLER. The veterinarians start in at \$1,500.

Mr. RAINEY. And what is the maximum?

Dr. MOHLER. \$3,540, and there is only one man receiving this maximum.

The CHAIRMAN. And the lay inspectors start in at what?

Dr. MOHLER. At the present time they start in at \$1,080.

Mr. RAINEY. And \$1,500 is the maximum. Here is the point I want to develop, alongside of the doctor's suggestion of these people coming to Washington: Ninety per cent of the members of Congress come to Washington for \$7,500 a year, where, in their home towns, if they stayed home and applied themselves with half the energy they do to the work of the Government, they would get \$25,000, \$50,000, and more. I have listened to Congressmen over on the floor of the House who, if they were home, in private practice, representing some private corporation, I dare say, would insist on a retainer of \$50,000 a year—easy money. I do not know why it is they come here. It must be a germ—something in the blood. They desire to serve the Government or to be patriotic, or they want power and influence in their community. It is rather difficult to draw the line of demarcation.

The CHAIRMAN. They are volunteers, are they not?

Mr. RAINEY. A number of them are conscripted?

Mr. TINCHER. To come to Congress?

Mr. RAINY. Yes. In a great measure it is for political reasons.

The CHAIRMAN. Is there anything more, Doctor?

Dr. MOHLER. Nothing else, thank you.

The CHAIRMAN. Thank you, Dr. Mohler.

(Thereupon the committee took a recess until 2 o'clock p. m.)

Activities under lump-fund items, Bureau of Animal Industry.

Projects.	Allotment, 1920.	Estimate, 1921.	Increase.
Inspection and quarantine:			
(a) Eradication of scabies in sheep.....	\$157,385	\$157,385
(b) Eradication of mange (scabies) in cattle and horses.....	57,881	67,881	\$10,000
(c) Supervision of interstate transportation of live stock and inspection of Southern cattle outside of the quarantine area.....	149,452	174,452	25,000
(d) Enforcement of the 28-hour law.....	28,000	28,000
(e) Inspection and mallein testing of horses for interstate movement.....	4,000	4,000
(f) Preparation and distribution of mallein and blackleg vaccine.....	13,652	13,652
(g) Preparation and distribution of field test outfits for dipping baths.....	1,500	1,500
(h) Investigation and chemical testing of dips and disinfectants.....	2,850	2,850
(i) Inspection of animals for importation.....	68,900	68,900
(j) Quarantine of animals at ports of entry.....	12,900	12,900
(k) Supervision over the sanitary handling and control of hides, skins, other animal by-products, hay, etc., offered for entry into the United States.....	14,780	17,800	3,020
(l) Inspection and testing of animals for export to foreign countries.....	7,500	9,500	2,000
(m) Inspection of vessels carrying export animals.....	2,700	2,700
(n) Investigation of methods of disinfecting hides.....	3,500	3,500
	525,000	1 565,020	40,020
Eradication of tuberculosis:			
(a) Animal tuberculosis control looking to eradication.....	1,457,000	1,457,000
(b) Preparation and distribution of tuberculin.....	28,000	28,000
(c) Investigation of animal tuberculosis.....	15,000	15,000
	1,500,000	2 1,500,000
Eradication of cattle ticks:			
(a) Tick eradication.....	673,580	673,580
(b) Preparation and distribution of field test outfits for dipping baths.....	18,400	18,400
(c) Live stock demonstration work in tick freed areas.....	50,000	50,000
	741,980	3 741,980
Dairy investigations:

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, December 11, 1919.

BUREAU OF PLANT INDUSTRY.

The committee met pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. Who do you wish to testify first, Mr. Harrison?

Mr. HARRISON. Dr. William A. Taylor is here and will present the estimates of the Bureau of Plant Industry.

The CHAIRMAN. You may proceed, Dr. Taylor.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. TAYLOR. The Bureau of Plant Industry, page 64. By way of preliminary statement it may help you to appreciate our situation somewhat if I say that there has been an alarming increase in the cost of the work of the Bureau of Plant Industry, which involves travel and field experimentation, including the employment of labor, the purchase of equipment, and the numerous ordinary things that have to be done in experimentation in the production of crops. We have cut close in conducting our work this year. We shall be compelled to cut still closer, even to stop some important lines of work in order to maintain those which appear to be more important, under these estimates. This is emphatically true of the paragraphs which do not provide increases, as two or three do, specifically, to meet these increased costs. They are simply the increased costs which a farmer would experience if he had no income from crops sold. Costs are up, labor is up, materials are up, equipment is up, and we are hard up against it when it comes to carrying along our work.

It may help in connection with the work of the Bureau of Plant Industry to recall that it is necessarily undertaken upon a national basis. The problems that we attack are either big national problems, broad regional problems, or highly specialized problems which, in the large, State activities are not in a position to grapple with, at least not by themselves. This policy has rested on the understanding that when the department was established in Lincoln's administration and the State agricultural colleges at substantially the same time were provided, the country adopted a dual policy with respect to the encouragement of agriculture. This in part was effected through appropriations to the States for their colleges and their experiment stations, and that the remainder was effected through the Federal department. Subsequently as the work of both the State institutions

and the department developed and took shape, particularly at a time about 20 years ago during the long secretarial administration of Secretary Wilson, a fairly definite concrete policy was formulated which I think in general has been followed, certainly in the work of the Bureau of Plant Industry, of asking the question every time a proposal comes up, "Is this a question which requires attention by the Federal department, either by itself or jointly with the State activities?" We recognize a citizen of a State as a citizen of the United States also. We recognize a group of citizens as entitled to a hearing and consideration here. We know that this is in your minds as the real policy of the Federal Government with respect to the encouragement of agriculture. We are dealing here with an industry which during this year has produced something like \$15,000,000,000 worth of crops, independent of the live stock and of other production. The appropriation which these estimates cover in the Bureau of Plant Industry is the appropriation which we submit is necessary adequately to cope with the problems that we carry the responsibility for with respect to the production of crops, the control and eradication of plant diseases, the improvement of crops, the introduction of new ones from other countries, and to a minor extent to the utilization of crops.

I offer these suggestions merely by way of a reminder as to what our feeling is, what our understanding is of the purpose of the department and the general policy of the country with respect to them.

In the statutory roll, if you wish to take that up first, on page 64, item 12 involves a change in designation of the position heretofore carried as one seed warehouseman, at \$840, which in the estimate is changed to laboratory aid at \$840. In this, as in many of our low-salaried statutory positions, we have not found it possible to secure people to do the work. We have approximately at the moment, I believe, about 100 vacancies in these low-priced statutory positions in the Bureau of Plant Industry. People come into them, if they have nothing better in sight; they get a little experience with us, and find a better job and resign, and then we have to hunt for another. As a laboratory aid, in which position we use young people, we can use this place more effectively. As it stands of course we can not fill it with the laboratory aid.

The same character of change is involved in items 32 and 36. Item 32 is on page 65, one artist, \$900, changed to one laboratory aid, \$900, and item 36 on page 66, one photographer.

The CHAIRMAN. How about item 35?

Dr. TAYLOR. That is the same general character except it is a different rate. Item 36 is a photographer at \$840, changed to laboratory aid, \$840.

Item 35, one photographer, \$1,200, changed to one clerk, class 1, \$1,200.

The CHAIRMAN. Why is that change made?

Dr. TAYLOR. For the same reason, Mr. Chairman, that it is not possible at this time to secure and retain a competent photographer for \$1,200. The time was not so long ago, say 5 years ago, when \$1,200 was attractive to a photographer.

The CHAIRMAN. Are you going to dispense with his services?

Dr. TAYLOR. He has dispensed with his own services by resigning. The place is vacant.

The CHAIRMAN. You are getting along without a photographer?

Dr. TAYLOR. We are getting along without that particular one.

Mr. JACOWAY. I thought you just changed the name, but retained the man on the roll and let him draw the same money.

Dr. TAYLOR. These are vacant. The positions are so nearly continuously vacant that we feel it is right to make them available for clerical work.

Mr. CANDLER. You propose to fill item 35 with a clerk that you already have in the service?

Dr. TAYLOR. Yes; or a new appointment as may be needed at the time. What the situation will be on July 1 when this new statutory roll will be available, we, of course, can not tell, as to individuals.

Mr. RUBEX. This clerk will not do the same work that the photographer did?

Dr. TAYLOR. No; just clerical work.

Mr. PURNELL. Is it necessary to have a highly trained photographer for the work?

Dr. TAYLOR. Yes, sir; if the photographic work is to be done at all in the illustration of investigational features, it must be high grade. Money spent for low quality photographic records is wasted.

Mr. PURNELL. What do you propose to do for a photographer now?

Dr. TAYLOR. In this case?

Mr. PURNELL. Yes.

Dr. TAYLOR. We shall have to let these go.

Mr. PURNELL. Dispense with the services of a photographer?

Dr. TAYLOR. Yes, sir; we can get along without this photographer.

Mr. RUBEX. You have other photographers that you pay other salaries?

Dr. TAYLOR. Yes, we have. Many of our investigators do their own photographic work.

Mr. JONES. Do you have anyone here on the statutory roll who draws two salaries?

Dr. TAYLOR. It is not possible.

Mr. JONES. It is so reported that men draw two salaries in different departments.

Dr. TAYLOR. In the Department of Agriculture?

Mr. JONES. I do not know whether it was in the Department of Agriculture; I only ask you if it is. I only ask if a man draws two salaries so that it amounts to \$2,000?

Dr. TAYLOR. You have in mind the question whether any employee on the statutory roll in the Department of Agriculture draws a salary elsewhere. He could not draw two salaries in the Department of Agriculture. Whether there is any statutory employee of the department drawing a salary from the Government elsewhere I do not know. Not in the Bureau of Plant Industry.

Mr. CANDLER. I think there is a statute of the United States that prohibits a man from drawing two salaries.

Mr. JACOWAY. There is.

Dr. TAYLOR. The law specifies that two salaries totaling in excess of \$2,000 can not be drawn by one person.

Mr. JONES. In other words, if he does not draw \$2,000 he can have two positions, one for one department part of the time, and in another department part of the time.

Dr. TAYLOR. Yes.

Mr. HARRISON. He would have to work full time for the department?

Mr. JONES. Eight hours for you and the other department at night.

Mr. HARRISON. The only cases I know of involve some employees who work for the War Risk Insurance Bureau for a few hours at night. When the War Risk Insurance Bureau needed large numbers of clerks it sought the services of some of the employees in other executive departments for night work. Even in these cases, the total compensation may not exceed \$2,000.

It may interest the committee to know that, on the 30th of June, 1919, we had 377 statutory places which were vacant and which we were having difficulty in filling because of the low salaries. On July 31 there were 377 vacancies; 365 on the 31st of August; 375 on September 30; 388 on the 31st of October; and 404 on the 30th of November.

Mr. RUBEY. What was the average salary?

Mr. HARRISON. All the way up to \$3,000. One place in the division of publications, which was provided for in the current appropriation act, remained vacant for five months, and the money went back to the Treasury because we could not get a man with the requisite qualifications. We succeeded about a week or so ago. Another place, in the Bureau of Soils, at \$1,440, was vacant for five months, and the money went back into the Treasury for that period. This shows the difficulty we have in getting people and how the work of the department is held up because of our inability to secure eligibles at these low salaries. The \$3,000 place is the highest. The remainder of the places for which I have figures carry salaries of \$1,800 and less.

Dr. TAYLOR. Item 46, on page 66, one laboratory apprentice, \$720. We have asked a change of designation to one messenger or laborer, \$720, for the same general reason. The places of laboratory apprentice and teamster have been vacant for several years on account of the inability to secure help at the salary provided.

Item 63, on page 67, one blacksmith at \$1,200, we ask to be changed to one gardener at \$1,200.

The CHAIRMAN. You are dispensing with the services of the blacksmith?

Dr. TAYLOR. In some cases. In others we have had to appoint a blacksmith on lump in order to get a blacksmith at all.

The CHAIRMAN. Do you propose to employ a blacksmith from the lump sum, or dispense with his services?

Dr. TAYLOR. In the case of a blacksmith, we have to continue him on the lump sum.

The CHAIRMAN. How about the photographer?

Dr. TAYLOR. The photographer is a straight change from photographer to clerk.

Mr. JACOWAY. I do not get it clear in mind, unless this is it: You have a photographer, and he says in substance that he can not work for \$1,200, and there is a blacksmith who says he can not work for

\$900, and they quit. Then you hire some other persons, assign them anywhere in the department you want to, and the blacksmith and the photographer go out of the service. Is that it?

Dr. TAYLOR. Yes.

The CHAIRMAN. I understand that you will hire a man at an increased salary, and pay him from the lump sum?

Dr. TAYLOR. If we have the money available and can get the men.

The CHAIRMAN. Their services were required in the past. If their services are required now the proper thing would be to take them on at an increased salary.

Mr. McLAUGHLIN of Michigan. If a blacksmith is on the statutory roll at \$1,200 and he is dissatisfied and resigns, and the next day you get another blacksmith and put him on the lump-sum roll and pay him what you have to pay—\$1,500, say—and carry him that way, is that done?

Dr. TAYLOR. If an appointment of that character is made, the transfer from the lump-sum to the statutory roll is recommended to you in the estimates.

Mr. McLAUGHLIN of Michigan. Then the next time the estimates are made that man who was hired at \$1,500 is transferred to the statutory roll at \$1,500?

Dr. TAYLOR. At the salary which he has.

The CHAIRMAN. When you drop them from the statutory roll you put them on the lump-sum roll at whatever salary you think proper?

Dr. TAYLOR. My understanding in the case of both of these is that these represent places vacant now, or that have been so continuously vacant, vacant so much of the time during the last fiscal year, that it is evident that we can not keep them filled with competent people.

The CHAIRMAN. Are they dropped entirely, or are their places to be filled by appointments from the lump-sum roll?

Dr. TAYLOR. I can not tell you that, Mr. Haugen, without looking up the particular cases.

Mr. JACOWAY. But you do know the photographer is gone and is not working?

Dr. TAYLOR. That is my understanding.

Mr. JACOWAY. You have not increased the salary on the lump-sum roll? He has gone, and so has the blacksmith?

Dr. TAYLOR. Yes.

Mr. JACOWAY. Instead you have appointed other people to do clerical work?

Dr. TAYLOR. No; we can not appoint a clerk in this photographer's place.

Mr. JACOWAY. I thought you filled his place.

Mr. CANDLER. He has asked to have it changed, so that it may be filled.

Dr. TAYLOR. We want to able to do that; yes.

Mr. LESHNER. Where do you get this blacksmithing work done?

Dr. TAYLOR. We may be getting it done outside. I do not happen to know in this case.

Mr. RUBEY. Is it possible for you to let a man go because he will not take a certain salary, say \$1,200, and there is a vacancy? Is it possible for you to employ some other man from the lump-sum roll to take his place?

Dr. TAYLOR. If we have the money, we have the authority; yes, sir.

Mr. RUBEY. You have the authority to do that?

Dr. TAYLOR. Yes, sir.

Mr. RUBEY. If he resigns you can appoint him to do that work from the lump-sum roll?

Mr. McLAUGHLIN of Michigan. Yes; you can.

Dr. TAYLOR. Not to do the same work.

Mr. RUBEY. You can not put him back in the same position and pay him from the lump-sum roll?

Dr. TAYLOR. Not to do the same work.

Mr. RUBEY. You can transfer him from the statutory roll to the lump-sum roll?

Dr. TAYLOR. Not to do the same work. He can be transferred after change of duties.

Mr. HUTCHISON. Suppose you have an appropriation of \$1,200. That office is vacant for four months. You can not give a man \$150 for eight months?

Dr. TAYLOR. No. We can not pay him higher than that rate in that position. We can not pay him for any day higher than at that rate of \$1,200.

Mr. HUTCHISON. But you can not get anybody else for the position?

Dr. TAYLOR. No.

Mr. HARRISON. The salary for four months goes back into the Treasury.

Mr. JONES. That probably answers my question, but I will put it to you and see. Suppose during the year you want a photographer at \$1,200 a year; could you hire him and pay him from the lump-sum appropriation?

Dr. TAYLOR. Yes.

Mr. JONES. Then you are not losing any opportunity for getting a photographer by eliminating him from this estimate?

Dr. TAYLOR. No, sir.

Mr. JONES. Does not that, in effect, make it so that you can transfer, indirectly at least, or at least get some persons from the statutory roll to the lump-sum roll?

Mr. RUBEY. The money must be available. If the money is available, they can hire that man. If we do not appropriate enough, they can not.

Mr. JONES. With regard to the lump-sum appropriation, they may manipulate the whole fund to meet the condition. In other words, Doctor, suppose there are half a dozen of these items on the statutory rolls; if you find yourself in the same condition as now, that you can not employ the men at the salaries fixed on the statutory roll, because during the year changed conditions result in labor being less plentiful or something of that sort, and there is no provision made on the statutory roll to meet the situation, you can hire those men and go to the lump-sum appropriation and pay them the price fixed?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. You can pay them any amount you wish under the lump sum, up to certain limits?

Dr. TAYLOR. Theoretically, yes; actually, no.

Mr. McLAUGHLIN of Michigan. You can hire a man and pay him more than the one who left the job was getting in the statutory roll?

Dr. TAYLOR. Yes; that is actually one of the difficulties.

Mr. McLAUGHLIN of Michigan. You can transfer this man after you have hired him at the higher rate and transfer him next year to the statutory roll at the salary he was receiving out of the lump sum?

Dr. TAYLOR. If you approve it.

Mr. McLAUGHLIN of Michigan. That is an increase of the salary of the man under the statutory roll?

Dr. TAYLOR. No, sir.

Mr. McLAUGHLIN of Michigan. It is an increase of the statutory compensation.

Dr. TAYLOR. It is an increase of pay for services rendered.

Mr. McLAUGHLIN of Michigan. It is an increase of salary in the statutory position, it seems to me.

Dr. TAYLOR. I think, Mr. McLaughlin, that the question there is just this: That, if you gentlemen do not approve and the Congress does not approve the transfer, or confirm the transfer from the lump sum to the statutory roll, the department can not do it.

Mr. McLAUGHLIN of Michigan. That is all right. I am entirely willing to do it. I like to see these men paid well. All I have ever had any kick about on any of these things is that we have had the responsibility but no authority over the matter. If we did not have the responsibility I would not care, but, having the responsibility, I feel we ought to have some authority.

Dr. TAYLOR. Our difficulty in administration in times when the dollar has shrunk, and outside industry has recognized that, is that, if we are tied 18 months or two years ahead, we can not say with any accuracy what we will require when these funds are available. In general terms, we do; in the larger sense we can, but we can not with accuracy.

The CHAIRMAN. In other words it is necessary to leave it to the department to determine salaries?

Dr. TAYLOR. Not entirely, I would say. To an extent, if there is to be efficient administration, I think so.

The CHAIRMAN. That is practically what is done now except for a few salaries paid out of the statutory roll.

Dr. TAYLOR. If there is to be full efficiency maintained, I think it will be found that in Government service, as in private business, there will have to be some discretion left to the administrative officials.

The CHAIRMAN. The present and past practice has been to leave the matter entirely to the department, outside of the statutory roll.

Dr. TAYLOR. In so far as lump sums are concerned, except for the limitation which Congress has fixed.

The CHAIRMAN. The limitation of \$4,500?

Dr. TAYLOR. Yes.

The CHAIRMAN. What do you say as to enlarging the statutory roll?

Dr. TAYLOR. With respect to scientific employees?

The CHAIRMAN. A large portion of the employees and the new ones to be added to the service.

Dr. TAYLOR. My feeling with respect to that would be this: That in two important particulars it would be damaging to efficiency. In the first place, for this reason, that in planning scientific work it is not possible to say 18 months in advance what manner, what quality of men can be got for a given job. You make an appropriation on an estimate which we submit. Our ideal would be perhaps a \$4,000 man, a full-grown, adequately-trained, experienced man. The time comes when the money is available on July 1 next. No such man can be had. Our next step may be the securing of a \$2,500 man and a \$1,500 assistant as the next best combination for attacking that particular problem. If we are tied by a \$4,000 statutory position we can not do it. It is either pay a \$3,000 man \$4,000 a year, which is destructive of morale as well as wasteful and unjustifiable in the handling of Government business, or let the work stand and come back to you a year from then for modification of that salary.

The second reason which occurs to me, which renders the statutory roll for scientific personnel inadvisable is this, that on a fixed statutory roll promotion can not occur except through impairment of the service by death or resignation. A fixed statutory roll leaves the administrator powerless to meet competitive conditions which arise, and they frequently arise and have to be settled within a period of a few days. In general, they have to be settled promptly for the reason that we have no contract arrangement, either actual or ethical, through which an American citizen is required to work for the Government for any fiscal year or number of fiscal years. Private employment has.

The CHAIRMAN. According to that, he should be placed on the statutory roll, then?

Dr. TAYLOR. I would not say that, Mr. Haugen. In the case of positions which are of a nature that makes them to a considerable extent interchangeable there is less objection.

Mr. JACOWAY. You have stated the difficulties. What is the solution?

Dr. TAYLOR. In my judgment the solution is to continue administrative authority and hold us to account.

The CHAIRMAN. Hold the department to account sounds all right, and is proper, but there is no accounting. That is not the fault of the department nor of this committee, but so far as Congress is concerned there has been no accounting.

Mr. RUBEY. Is not there an accounting at least to some extent? For instance, in connection with each one of these lump sum funds do they not set out in this statement how many men are employed at \$3,500, how many at \$3,000, and so on?

The CHAIRMAN. That is an estimate.

Mr. RUBEY. I know, but that is an indication. It shows in one column that they had a certain number of men at a certain salary in 1919, and there is in these estimates here some semblance at least of an accounting of what they have done with the money.

The CHAIRMAN. That is true. This table indicates what the department intends to pay these people.

Mr. RUBEY. That is in the future. What I want to point out in the tables is that they have given only what they spent in 1919. That is the only year that has been completed. They give an accounting of how they spent the money, and in the other column

they give an estimate of how they expect to spend the money next year.

Mr. JONES. There is probably sufficient information in these tables. As the gentleman says, one column shows the estimates for 1921 and the other shows the expenditures for the same things for 1919. The practical question that puzzles me is this, as was brought out by the head of the Weather Bureau when we were discussing the matter of employing five firemen to do the work that one ought to do (or three, at least, with the engineer), what is the character of work that is carried on by them? This committee asks the question, What of the administration of the department itself? There is a general notion throughout the United States—and you men who work for the Government as well as we here know it—that the question of Government efficiency is a joke. Whether that is true or not, it is the impression that, if private interests ran their business with the same amount of efficiency that the Federal Government is run they would become bankrupt. Just how we can remedy that I do not know, but I am satisfied—I have no proof of it—but I am satisfied, as sure as I am sitting here, that there are too many men employed in the service, in every department of the Government. There is where the appropriation ought to be cut. Whether you can do it or not, whether you have sufficient knowledge to do it fairly and equitably or not, is the question that puzzles me.

Dr. TAYLOR. So far as furnishing information is concerned as to exactly what is paid on lump funds, I take it that would not require more than a specification that the names of the individuals should be indicated. That information is obtainable at the department, certainly, with respect to each lump appropriation, with respect to any employee.

Mr. CANDLER. Under each item of lump-sum appropriation you set forth in the estimates the positions which are to be filled and the amounts at which each position is to be filled—the amount received by the employee. That is done every year in the estimates. Of course, we have to rely on the department to carry out in good faith the estimates.

Mr. JONES. I do not doubt that the department has expended \$9,000 for three, four, or five employees, as this schedule shows, but the point that worries me is whether that amount of work ought not to have been done at an expenditure of \$2,000. You see my point. That is a question of efficiency.

Mr. JACOWAY. I get an entirely different idea from that. If it were possible to get the people to do the work, I would be willing to spend a hundred million dollars for the Department of Agriculture.

Mr. JONES. I am not raising any issue with the Department of Agriculture as against other departments.

Mr. HARRISON. How about the men doing two or three men's work?

Mr. JONES. If that condition exists—

Mr. HARRISON. That condition does exist; there are men in the department who do work that ought to be done by two or three men.

Mr. JONES. Is the case of the five firemen the only one in which the work is not effectively done?

Mr. HARRISON. Is it possible for us to determine here whether certain men are doing their work effectively?

Mr. JONES. Yes; if a man says that two boilers are burning a certain amount of coal, that are correlated together, I do not care what the conditions are, that can be done by one man.

Mr. RUBEY. You mean one man on each shift?

Mr. JONES. I mean three men working 8-hour shifts. From the conditions spoken of by the Chief of the Weather Bureau, I believe, if the labor organizations would permit it, that the job of fireman and engineer could be combined, and the engineer would have little work to do. There is only one thing that is essential and that is to put coal in the boilers.

Mr. McLAUGHLIN of Michigan. And a ton and a half in 24 hours.

Mr. JONES. It is outrageous.

Dr. TAYLOR. The practical question that arises in cases like this is that, if you have statutory places at \$600 a year and firemen are worth \$900 a year, all that you can get for \$600 are boys and cripples.

Mr. JONES. I appreciate that.

Mr. HARRISON. These firemen get \$840 and \$720, while the Potomac Electric Power Co. is paying its firemen \$5 a day. You can imagine, therefore, the situation in which the department finds itself with reference to such positions.

Mr. LESHER. But they handle a great deal of coal, I imagine.

Mr. HARRISON. Our central power plant is comparable with the plant of the Potomac Electric Power Co.

Dr. TAYLOR. This principle is a vital one in connection with the statutory roll and the operation of the department activities both here and in the field. For the money that we can pay we can not get efficient men and have to take the culls and keep them shifting, with a frequent turnover.

The CHAIRMAN. When a member of the committee asks a question of a representative of the department it should not be construed in any particular as questioning the integrity of the department; the purpose is to get at the facts in order that Congress may do its duty.

Let me read from a report [reading]:

There is no doubt whatever that millions of dollars of the money which Congress voted for the conduct of the war and placed no restrictions thereon have been expended illegally and without warrant of law by the War Department in the purchases of land and the construction of new military posts since the armistice and without the express authority of Congress, as should have been the case.

That is exactly what we are making possible for this department to do. This line of inquiry is not for the purpose of criticizing the department, but so that we may intelligently inform Congress and do our duty. When we ask questions here, it is not for the purpose of impugning the integrity of the department or anything of the kind.

Mr. CANDLER. That statement is merely Mr. Anthony's report of the purchase of land by the War Department. That is controverted sharply.

The CHAIRMAN. That is the report.

Mr. McLAUGHLIN of Michigan. You do not doubt for a minute that the War Department wasted millions?

Mr. CANDLER. But that is an ex parte statement, never submitted to the committee, and never admitted.

The CHAIRMAN. I am trying to see whether we can conduct the business of this department in a satisfactory manner and if we can improve upon the present method. I am asking these questions with a view to giving each chief of bureau an opportunity to express himself on the proposition. It will then be up to the committee to determine whether we shall continue as in the past or adopt some other plan.

Mr. RUBEY. I appreciate that the questions you ask and the questions asked by the committee have not been with the view of criticizing, but with the view of getting information; but frequently we ask questions to get the information in the record so that the members of the House may get the information which we may already have.

Here is another point: The question came up the other day about these firemen in the Weather Bureau. That is a place where possibly there is a mistake made, and too many men are employed, and, while that crops out in the record and we get that information, there are hundreds of cases in the Department of Agriculture that we do not know anything about, and we do not get a chance to know anything about, where men work overtime, where they go back on Sundays, and that sort of thing; and I take it that, all in all, they are doing the best they can and that the Department of Agriculture, the chiefs of bureaus and those under them, are giving the very best service they can for the money they receive.

Dr. TAYLOR. Would you pardon just this interpolation? Two minutes will suffice for me at this time. Last evening I happened to look over the report of the dean and director of one of the leading agricultural colleges and experiment stations of the country who has for two or three years now undertaken to administer the affairs of his institution under a rather minutely segregated budget, which includes a statutory roll, and he relates there certain experiences that I am sure would be interesting to you. I have not the matter in full, but I have this paragraph which I jotted down, which consolidates his experience under such a system in operating an activity fairly comparable with the Bureau of Plant Industry. This is what he says [reading]:

Do people want the money well spent, or is it better that it be spent according to a printed price list? Is the great consideration human efficiency or mechanical efficiency? A segregated minutely itemized budget is an expression of mechanical efficiency which lacks the breath of life. It expresses the desire for accounting procedure and ignores the fundamentals of successful administration.

This follows a statement of specific instances of the loss of men from his investigational force through inability with reasonable promptness to meet competition, and it is, I think, what administrators of research and comparable work would experience from a statutory roll for scientific workers.

The CHAIRMAN. That may be good logic, but after all, Congress has certain functions to perform, and the question involved here is whether it shall perform them or turn them over to somebody else to perform.

Dr. TAYLOR. You understand, Mr. Chairman, that I am with you and desire to help.

The CHAIRMAN. What grieves me is that every time we ask a question it is assumed that we are questioning the integrity of the department. I never charged a public officer with lack of integrity unless I knew it absolutely and never wish to do so.

Dr. TAYLOR. I take it as a compliment to me that you ask me these questions, and I have answered you frankly.

The CHAIRMAN. Can you come back to-morrow at 10 o'clock, Dr. Taylor?

Dr. TAYLOR. Yes.

(Thereupon, at 5.20 o'clock p. m., the committee recessed until to-morrow, Friday, December 12, at 10 o'clock a. m.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Friday, December 12, 1919.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

BUREAU OF PLANT INDUSTRY—Continued.

The CHAIRMAN. Dr. Taylor, you may proceed.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

Dr. TAYLOR. Mr. Chairman, I believe we were at item 67, page 67, on the statutory roll, a change of designation of a \$600 position from "teamster" to "messenger or laborer" at the same salary, for the same reason as stated under item 46 on page 66. These positions have been vacant most of the time for several years, particularly during the last two years, and can not be filled.

Mr. JONES. Suppose you had a teamster at \$600 on the statutory-roll position, would you have found the necessity for asking now for one messenger or additional laborer at \$600?

Dr. TAYLOR. In the event that the messenger or laborer positions were on the statutory roll also?

Mr. JONES. Oh, no. You are now changing a teamster to one messenger or laborer at the same salary, and your argument is that you can not get a teamster or have not got a teamster at \$600. Now, suppose the statutory roll was filled as to this teamster, and also as to the photographer we had up yesterday, and one or two others—

Dr. TAYLOR. Yes, sir.

Mr. JONES. Suppose they were filled and you could fill them, would you find the necessity existing now to add to the statutory roll?

Dr. TAYLOR. Yes.

Mr. JONES. It is a transfer you are making, then?

Dr. TAYLOR. We now need a laborer, and it is either to provide a laborer on the lump fund or on the statutory roll in this place.

The CHAIRMAN. What you propose to do is to drop this laborer at \$540 and add one messenger to the number of messengers on last year's roll?

Dr. TAYLOR. It is to change this—

The CHAIRMAN. Drop this item?

Dr. TAYLOR. Yes. The \$600 is reverting—

The CHAIRMAN. Then you are adding one to the other item?

Dr. TAYLOR. Yes.

Mr. JONES. He is speaking of 67 and you are speaking of 68.

The CHAIRMAN. The same rule applies to all of them.

Dr. TAYLOR. \$600 is reverting to the Treasury through our inability to secure a teamster at \$600. We need the additional laborer position, which we can fill at \$600.

The CHAIRMAN. So you have added one to the roll?

Dr. TAYLOR. Added one; yes. In the case of item 68, 21 laborers, at \$540 each, changed to 21 messengers, or laborers, at \$540 each, that is to make it possible to employ messengers or laborers as the needs require.

The CHAIRMAN. In other words, you substitute item 69 for 68?

Dr. TAYLOR. Yes, sir. Item 69 carries 21 messengers or laborers, at \$540 each, in lieu of 21 laborers.

The CHAIRMAN. That takes the place of item 68?

Dr. TAYLOR. Yes, sir. That completes the statutory roll.

On page 68, in the general paragraph under which the Bureau of Plant Industry operates, the paragraph which authorizes the general activities, there is no change. That is an authorizing and not an appropriating paragraph.

The CHAIRMAN. There is no new language?

Dr. TAYLOR. No, sir. On page 69, item 79, the subappropriation "for investigations of plant diseases and pathological collections, including the maintenance of a plant-disease survey," carries an increase of \$15,000 over that for the present fiscal year. This increase is desired for the enlargement of the work of the plant-disease survey project, which has proved its value and usefulness not only to the Bureau of Plant Industry pathological service but also to the whole State experiment station service, that has to do with the investigation and control of plant diseases.

It consists of prompt scouting and collection of information regarding the occurrence of plant diseases and the dissemination of that information promptly to the institutions, in order that there may be a continuing touch between the pathologists both of the department and of the State institutions with the plant disease developments as they occur, rather than through a belated information received after the season has ended. It enables quick action and is in the nature of a comprehensive plant disease scouting service.

Mr. ANDERSON. When was this service inaugurated, Doctor; last year?

Dr. TAYLOR. It was begun in a small way three years ago and was enlarged during the war emergency period and maintained from funds from the stimulating agriculture appropriation which ceased to be available June 30.

Mr. LEE. What was your first appropriation for this item three years ago; do you remember?

Dr. TAYLOR. I think it was \$10,000, the amount which it still carries and which is the amount—

Mr. ANDERSON. You want to increase that \$10,000 by \$15,000, making the total \$25,000?

Dr. TAYLOR. Yes; for the plant disease survey. It is an activity which is distinctively national and broadly helpful in that it insures quick information when a new plant disease appears or when a known plant disease shows indications of becoming epidemic. We believe it is in the interest of sound administration to enlarge and develop this.

Mr. ANDERSON. How many men do you employ on this item?

Dr. TAYLOR. I can not tell you offhand, Mr. Anderson. I think about eight men are now employed, including the temporary employees.

Mr. ANDERSON. Do these men have connections out through the country by which they find out about the existence of these diseases, or is the extent of the investigation confined to what these men themselves can find out?

Dr. TAYLOR. No; it consists very largely of an organized information service, you may say, the plant pathologists of the State institutions cooperating. But it does require at times quick sending into the field during the crop season of men qualified on special lines of plant pathology to diagnose and determine the particular diseases involved in such a survey.

Mr. ANDERSON. What I had in mind was that eight men employed under an appropriation of this size would not discover very much themselves if they had no organization through which the information came.

Dr. TAYLOR. No. This barely maintains, you may say, a skeleton organization here.

Mr. ANDERSON. I take it this plant survey is connected up with the State colleges and the county agents, so that your information comes from all the sources that are actually in contact with the fields themselves.

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. Are your men sent out at the suggestion of the county agents or colleges, or are they kept constantly in the field?

Dr. TAYLOR. They go out upon the receipt of any information that appears significant, whether it comes from farmers or from State institutions or from county agents, or frequently upon receipt of diseased plant material here which is suspicious or is identified as of serious character. A case in point would be the "take-all" disease of wheat. When the first material came in last April or May—in that case I believe it was from a county agent in Illinois—

The CHAIRMAN. Do you accept the work of the county agents and State officials and consider their findings as authoritative?

Dr. TAYLOR. To the extent that the information exists. It frequently develops—

The CHAIRMAN. They are high-class, specialized men?

Dr. TAYLOR. These plant-disease survey men are highly trained, specialized men. If you would like a fuller outline I have here—

The CHAIRMAN. We have an understanding that you will incorporate in the Bureau of Plant Industry statement the amount appro-

priated for each item. If you will insert that in the record that will cover it.

Mr. HARRISON. We will see that that is included in the case of each bureau.

The CHAIRMAN. That will save the time of the committee. Item No. 80 is next.

Dr. TAYLOR. Item No. 80, on page 70, "For the investigation of diseases of orchard and other fruits." In this subappropriation, which calls for \$87,935, there is included an increase of \$7,000. This increase is needed for pathological inspection of fruits at market centers in cooperation with the Bureau of Markets, which maintains the commercial inspection that is conducted by the Federal Government. These pathological advisers to the commercial inspectors are trained pathologists whose business it is to diagnose accurately the diseases which are found in fruits that arrive at markets in bad order, so that there may be as accurate a differentiation between the spoilage in transit that results merely from bad handling and packing and loading, or bad refrigeration in transit, and the spoilage which is traceable to specific plant diseases which it may be possible to control, either through proper treatment in the field or during the packing process.

Mr. MCKINLEY. How many of these men have you?

Dr. TAYLOR. We have two at present.

Mr. MCKINLEY. How many markets is the Bureau of Markets covering?

Dr. TAYLOR. They have a number of inspectors. I do not know the exact number in their inspection service.

Mr. MCKINLEY. How can you get along with just two? Why don't you need them at all places if you need them at any?

Dr. TAYLOR. Our men are, you may say, the instructors, the technical pathological instructors, of the inspection force of the Bureau of Markets. They are the instructors also of city health department inspectors, in particular cases. This week, for instance, the health officer of the city of New York has appealed to us to permit our men to deliver a series of addresses to his local inspection force, to inform them with regard to the plant diseases and their relation to the wholesomeness or unwholesomeness of the fruit and vegetable food-stuffs under inspection by his force.

Mr. MCKINLEY. Do these two men go from place to place?

Dr. TAYLOR. Yes; although their principal headquarters—that is, as they stand now—are in New York and Chicago, which are the largest receiving centers of these perishables in the country. We should enlarge this force somewhat. It is maintained at the present time by a makeshift assignment of funds to carry these two men, because we recognize it is of very great importance to the growers and shippers of produce.

Mr. MCKINLEY. Why should you be forced to do that when they have a large amount of funds? Why should not they have these employees themselves?

Dr. TAYLOR. Because this is highly technical pathological work which has to root back into the pathological laboratories. These men must keep steadily in touch with the advances that are made, the discoveries that are made in plant-disease investigations. These

men, in fact, have to maintain small temporary laboratories in connection with their headquarters in New York and Chicago to take up, instantly, lines of investigation in these diseases that need attention there.

Mr. ANDERSON. Has this investigation any relation to any current inquiry of the Bureau of Markets in regard to the effect of different modes of packing, refrigeration, and so forth?

Dr. TAYLOR. It bears an advisory relation to that. It does not participate in that work.

Mr. ANDERSON. Is any investigation of the question of packing now being made by the Bureau of Markets?

Dr. TAYLOR. Yes; of the effect of handling, packing, loading, and so on; and this is chiefly with respect to that inspection service which the Bureau of Markets maintains, under which it issues certificates, upon the request of either the shipper or consignee, as to the actual condition of the shipment when it arrives. The Bureau of Markets workers rely on the Bureau of Plant Industry for their technical information on these diseases.

The CHAIRMAN. How long have these two men been employed?

Dr. TAYLOR. About two years. There was a considerably larger force.

The CHAIRMAN. If this appropriation is allowed, how many will be added?

Dr. TAYLOR. Probably two.

Mr. TINCHER. I see this item number 80 carries an authorization for \$8,000 to be used for the investigation of the diseases of the pecan. It is necessary to still carry on that work, is it?

Dr. TAYLOR. Yes, sir. There are certain stubborn diseases which are being attacked through long-time experimentation that require the continuation of that work if the pecan industry is to be aided through the control of its diseases.

Mr. TINCHER. This will make 20 years they have carried this item.

Dr. TAYLOR. I think not, sir; so far as the pecan itself is concerned. The 20 years evidently applies to the entire duration of the paragraph.

Mr. JONES. What is the attitude of the men engaged in the business of raising those things as to the investigations made by you? Do they spend any money themselves for investigating these things?

Dr. TAYLOR. The individual fruit growers?

Mr. JONES. Yes.

Dr. TAYLOR. They do not hire pathologists.

Mr. JONES. Why do they not hire pathologists? It is to their direct interest, is it not?

Dr. TAYLOR. How could a farmer hire a pathologist?

Mr. JONES. How can a lumberman hire a forester?

Dr. TAYLOR. The lumberman may have capital bigger than the farmer.

Mr. JONES. If that is your answer, that he has not got enough money to do it, that is what I am trying to find out!

Dr. TAYLOR. I think that is the answer, sir; and I think that is the fact with respect to much of what the Federal Government and

the States are doing in these technical lines. The Federal Government and the States have monopolized the field of technical research and advice to this basic industry of agriculture. Until very recently, there have not been production units of a sufficient size to make possible at all the employment of trained specialists of this character.

Mr. JONES. Will there ever be so long as the Federal and State governments assume this burden?

Dr. TAYLOR. That is a question which I can not answer. Federal and State aid in this respect has been a fundamental policy so far.

Mr. JONES. I notice your appropriation for 1911, under this general heading of item 80, was \$34,000. Now your estimate for 1921, a period of 10 years, grows to \$87,000. And that is not only true of this but it is true of every item presented to the committee—a growth of 100 per cent in nearly every request for these investigations.

Dr. TAYLOR. The work has grown; the country has grown, and the need has grown. I believe that will continue.

Mr. JONES. But this investigation of diseases; is there a new disease discovered every year in these things?

Mr. ANDERSON. Several of them.

Mr. RUBEY. If they only discovered one a year we would be all right. [Laughter.]

Dr. TAYLOR. If the cure for a disease could be accomplished in a year it would be a very small matter. But we are still in the pioneer stage of knowledge with respect to many of these diseases, and they can not be figured out at a desk or even in the laboratories. They have to be worked out step by step, just as human diseases have to be worked out.

Mr. LESHER. I believe Mr. Soper, in my district, hires a man and keeps him at his nursery all the time.

Dr. TAYLOR. There are instances of commercial activities that have reached a magnitude or are endangered so seriously where they can do that.

Mr. LESHER. He hires one of these college professors who goes right into his nursery and studies it.

The CHAIRMAN. We will take up your next item.

Dr. TAYLOR. The next item, Mr. Chairman, is number 81, "for conducting such investigations of the nature and means of communication of the disease of citrus trees, known as citrus canker," etc. This is a very important item, in which the work has reached a stage where we consider it safe to recommend a material reduction of the appropriation.

The CHAIRMAN. We started this appropriation with \$430,000, with a view to exterminate the disease. How close are you to cleaning up?

Dr. TAYLOR. As Dr. Kellerman has personally handled this item, I will ask him to discuss it, Mr. Chairman.

The CHAIRMAN. We will be glad to hear from Dr. Kellerman. Kindly state exactly what you have been doing, what you expect to do, and how much is required.

STATEMENT OF DR. KARL F. KELLERMAN, ASSOCIATE CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. KELLERMAN. Mr. Chairman, you will remember the work began approximately four years ago with the estimate that the work would require a total appropriation of approximately \$4,000,000; that the disease was widely spread and that a term of years, somewhat indefinite, would be necessary to eradicate it. The work has progressed very favorably and with very little setback at any time. Severe tropical storms on two occasions have spread the disease so widely that unusual expense was necessary in these localities. That was in Texas, Louisiana, Mississippi, and Alabama, at different times, we required rather unusual expenditures for inspectors and for disinfectants in destroying the disease in these places.

The principle from the very beginning has been to locate the diseased trees and to have them destroyed.

The CHAIRMAN. You pay for the trees?

Dr. KELLERMAN. The trees are not paid for. There is a prohibition against using any Federal money for paying for trees, and the State funds we have used in the same campaign have followed the same general plan of expenditure that we have outlined at the start. The only cases of reimbursement that have occurred have been reimbursement provided by local organizations.

The CHAIRMAN. To what extent?

Dr. KELLERMAN. No account has been kept of those by us because they have not been counted as part of the eradication campaign.

The CHAIRMAN. How general is it?

Dr. KELLERMAN. In general terms, I think it is safe to say that approximately between \$150,000 and \$200,000 has been paid in indirect compensation.

Mr. McLAUGHLIN of Michigan. During the entire time?

Dr. KELLERMAN. During the entire time.

Mr. McLAUGHLIN of Michigan. Of four years?

Dr. KELLERMAN. During the entire time. That does not count the properties that have been donated without charge by individuals.

Mr. McLAUGHLIN of Michigan. Donated for destruction, you mean?

Dr. KELLERMAN. Donated for destruction. Those cases come about in this way: If a serious outbreak of the disease is found in the center of a young planting, the supposition is that trees in a considerable area around that point will also be diseased. As a matter of cheapness, in eradicating the disease, it is better for us to destroy that entire planting instead of merely to destroy the trees that we find diseased and to keep inspecting to catch the additional diseased trees as they appear. Wherever it has been possible, therefore, we have asked for the donation of a line of apparently healthy trees around areas that are found diseased—this as a result of the experience of the first 18 months' work in the eradication. Many thousands of healthy trees, therefore, have been donated; I mean apparently healthy trees—trees that may have been diseased, but which, as far as our inspectors could find, were healthy.

The CHAIRMAN. Is that always done voluntarily?

Dr. KELLERMAN. Always voluntarily.

The CHAIRMAN. Does anybody make it up?

Dr. KELLERMAN. Rarely. That is represented by about \$150,000. About that much has been contributed by local associations, citrus growers, individual bankers, and other local interests, for the purpose of reimbursing people who can not afford to give up properties of their own.

Mr. McLAUGHLIN of Michigan. You said a few moments ago that this disease was widespread?

Dr. KELLERMAN. At the time the work started, it was unfortunately widespread. It had been introduced in 1911.

Mr. McLAUGHLIN of Michigan. We did not know that, because it was largely in Florida, according to the report, and we hoped it was not in other parts of the country.

Dr. KELLERMAN. It never has extended west of central Texas.

Mr. McLAUGHLIN of Michigan. It has not reached California?

Dr. KELLERMAN. That is the point; the large orange industry in California has never been threatened with the disease.

Mr. McLAUGHLIN of Michigan. How early did you know it had reached as far as Texas?

Dr. KELLERMAN. In 1915, I believe; in 1915 or 1916. I would have to refer to my records to find exactly when we found it that far West.

Mr. McLAUGHLIN of Michigan. My recollection is that you found it much further East and that you hoped to be able to keep it there.

Dr. KELLERMAN. That has been the feeling from the start, that we wanted to keep it in the eastern United States and to eradicate it from the eastern United States.

Mr. McLAUGHLIN of Michigan. Yes, but you are speaking of Texas, evidently, as part of the eastern United States. We did not have that idea at the time.

Dr. KELLERMAN. No; at the very beginning, we reported the occurrence of the disease in the region of Port Arthur, Tex. (that was the report), of the disease from nursery stock that had been imported that first introduced the disease. The original reports to Congress pointed out the occurrence of the disease at Port Arthur, Tex., at Wiggins, Miss., at a point I do not remember in Alabama, and a half a dozen points in Florida. The Florida points were emphasized especially in all of the discussions before the committees, because the Florida commercial interests transcended all the other commercial interests, in citrus culture.

The Florida citrus has been the big commercial citrus industry of the East. There has been a development of the citrus industry in the Satsuma orange, in what would have been too far north for the ordinary orange to thrive; that is, in northern Florida, Alabama, Mississippi, Louisiana, and Texas.

Mr. McLAUGHLIN of Michigan. It attacks the orange and what other kind of fruit?

Dr. KELLERMAN. It attacks all the oranges, grapefruit, limes, and lemons.

Mr. McLAUGHLIN of Michigan. It is confined to those?

Dr. KELLERMAN. It is confined to the citrus crop.

Mr. McLAUGHLIN of Michigan. Yes, I know it attacks those fruits, but I did not know but that there were some others.

Mr. KELLERMAN. No other types of fruit. Now this disease was so serious, was spreading so rapidly, that it apparently was going to destroy, within a few years, the entire citrus industry of the Southeastern United States. That was the reason for urging this campaign, and that campaign has been, I can safely say, completely successful. It has been. The disease, which was threatening to overrun Florida in another season had it been neglected for another season, has been reduced to almost complete zero. Only three trees have been found diseased in the entire State of Florida this year.

Mr. McLAUGHLIN of Michigan. In 1919?

Dr. KELLERMAN. During 1919 only one diseased tree was found in Mississippi. Those two States have made, decidedly, the most satisfactory record. That is partly due to the fact that in those States there were few, if any, abandoned citrus nurseries or abandoned citrus groves.

Mr. McLAUGHLIN of Michigan. You mean abandoned to the disease, with no effort to eradicate it?

Dr. KELLERMAN. I mean groves or nurseries that had been planted during the early years, abandoned by their owners and allowed to go wild, to turn back into jungle. Although more like ordinary scrub, uncultivated land, they consisted of anywhere from 5 to 50 per cent of scrubby orange trees. Those were not discovered at all until comparatively recently—during the last year and a half. In those abandoned groves the disease had become established, and, accordingly, the number of trees it has been necessary to destroy in Texas, Louisiana, and Alabama is still high, running from 1,000 to 9,000 in each State. That, however, while apparently a large number of trees, represents a very few trees that are grove trees and of value.

Mr. McLAUGHLIN of Michigan. Although the number of those trees is large, it would appear to me that it would be comparatively easy to take care of such a situation as that, if they were abandoned, by destroying the whole proposition.

Dr. KELLERMAN. That is what is now being done. It means a different type of inspection, however; it means the searching over of apparently open country for these wild citrus plantings, abandoned citrus plantings, instead of merely going to recognized citrus developments; and it has delayed the inspection work in those States on account of the necessity of a more general type of exploration and inspection. The work is progressing even in those States, however, so favorably that the confidence of the citrus producer in all of those States has been restored. That, I think, is one of the simplest ways to express the apparent success of the work up to the present time.

Mr. McLAUGHLIN of Michigan. Were those nurseries abandoned because of this disease?

Dr. KELLERMAN. No, sir; they were abandoned in most instances because of financial difficulties or frosts that brought about financial difficulties for the owners.

Mr. McLAUGHLIN of Michigan. So that the eradication of the disease and the assurance to the people that it can be eradicated is not the thing that has restored confidence and started up the industry again?

Dr. KELLERMAN. It is the thing that has restored confidence and has reestablished confidence in the industry in the States of Florida, Alabama, and Mississippi. I think confidence in the industry was

never lost in Louisiana, but citrus growing has always been a small home industry there.

In Texas, the industry in the northern part of the State, I think, is definitely gone. That has been perhaps the most troublesome area in many ways, both for the men who attempted to develop the citrus plantings, for the men who purchased them as they were being developed, and for the men who were trying to eradicate the disease. North Texas, that is the Houston section of Texas, is too cold for orange production. It is so nearly warm enough, however, that attempts have been made in successive cycles to establish orange production in that region; but the plantings have always frozen out anywhere from three to ten years after they were started.

Mr. McLAUGHLIN of Michigan. From the very first this impressed the committee as a very serious matter and something the Federal Government should take up, and, so far as I know, the members of the committee were entirely willing to make these appropriations that at the time seemed large but were necessary. The people of Florida—the legislature of Florida—contributed considerable sums of money?

Dr. KELLERMAN. Very large sums.

Mr. McLAUGHLIN of Michigan. They are still contributing?

Dr. KELLERMAN. Yes, sir.

Mr. McLAUGHLIN of Michigan. How about the contributions from other States?

Dr. KELLERMAN. The contributions from other States in many cases are larger than the sums the Department of Agriculture provides.

Mr. McLAUGHLIN of Michigan. How much in each State—can you tell us?

Dr. KELLERMAN. Texas has been appropriating approximately \$2,000 a month for carrying on its share of the work, or about \$24,000 a year; \$15,000 by Louisiana.

Mr. McLAUGHLIN of Michigan. How about Alabama and Mississippi?

Dr. KELLERMAN. Mississippi has ranged from \$8,000 to \$16,000, I believe.

Mr. McLAUGHLIN of Michigan. You can put the amounts in the record, can you?

Dr. KELLERMAN. I will put in the amounts for you.

Mr. McLAUGHLIN of Michigan. For each State.

Dr. KELLERMAN. Alabama has appropriated less; I think their contribution has been about \$5,000.

Mr. JACOWAY. Your initial estimate was for \$500,000, several years ago, wasn't it?

Dr. KELLERMAN. The suggestion was originally made, Mr. Jacoway, that \$4,000,000 would be needed for handling this work. The work has been financed on an annual basis instead of a lump sum.

Mr. JACOWAY. I am just trying to develop an idea here. Did you first come before the committee and ask for \$500,000 or \$250,000?

Dr. KELLERMAN. We asked for \$250,000 for the first annual appropriation.

The CHAIRMAN. I would like to ask you concerning the policy adopted. Is the plan of appropriating large sums to begin with in order to control a disease and eradicate it effective?

Dr. KELLERMAN. It is undoubtedly the wisest policy.

Mr. JACOWAY. That is what I was trying to get him to say. How was this disease introduced into the United States?

Dr. KELLERMAN. It was introduced by importing from Japan diseased nursery stock.

Mr. JACOWAY. And that error has been corrected so that none of this diseased stock can get in here now?

Dr. KELLERMAN. That has been corrected. That was corrected by the passage of the plant-quarantine act in 1912.

Mr. JACOWAY. This disease got such a control in other countries that it has practically destroyed the industry, has it not?

Dr. KELLERMAN. It has not destroyed the industry in Japan, where it has been for 10 or 15 years, because of difference in type of orange and also difference in climate. The Japanese climate is cool, and they do not grow our types of orange.

Mr. JACOWAY. By providing these sums of money and stamping out the disease where it is getting a foothold, won't we in time make the United States the greatest place for citrus fruits in the world? In other words, won't we make our country the leading market for citrus fruits?

Dr. KELLERMAN. I think so. I think there is no doubt about it.

Mr. McLAUGHLIN of Michigan. Will you please put in the record the amount spent in each State and the contribution of each State?

Dr. KELLERMAN. Yes, sir.

Mr. JONES. Not only by States, but by individuals in the State?

Mr. McLAUGHLIN of Michigan. The amount of money available in each State.

(The statement referred to follows:)

Citrus canker expenditures, 1915-1919, inclusive.

State.	State appropriations.	Miscellaneous contributions within States.	Federal allotments.
Alabama.....	\$4,973.75	\$3,987.50	\$88,796.50
Florida.....	459,304.21	121,501.50	767,702.83
Georgia.....	12,000.00	24,822.76
Louisiana.....	40,000.00	61,142.26
Mississippi.....	50,000.00	52,619.25
Texas.....	78,217.00	135,544.41

¹ Includes nursery inspection; greater portion of fund spent for citrus canker eradication.

Definite estimates covering personal contributions not available.

The CHAIRMAN. You mention in the note the question of eradication—that in the Eastern States it is practically completely eradicated. If that is the case, it seems to me \$109,720 is a large appropriation. We have appropriated \$876,320 to date for this work. You are now asking for \$109,720 in addition for next year. We appropriated the amount at first with the view of stamping out the disease immediately, and we hoped we would not be asked for any further appropriation. Will the \$109,000 be required after all this year's amount is expended?

Mr. JONES. It is proposed to use \$86,720 of that amount for salaries?

Dr. KELLERMAN. This work, from the very beginning, has been largely a question of salaries and traveling expenses. We have put our men in the field and had them examine the orange groves, locate the disease, and report the disease to the owner and to the State authorities.

The CHAIRMAN. How much did you spend for labor?

Dr. KELLERMAN. We spent about one-tenth of the appropriation for labor.

The CHAIRMAN. The question is, Will you need the \$109,000? Will you need that much?

Dr. KELLERMAN. My guess would be that we will spend about \$95,000, if we have no setbacks. We should have a small reserve for emergencies.

The CHAIRMAN. How much will you spend this year?

Dr. KELLERMAN. We will spend about \$180,000 this year.

The CHAIRMAN. How much of this has been turned into the Treasury from year to year?

Dr. KELLERMAN. We have usually used the whole amount; last year we did not. I would like to explain that \$430,000. A quarter of a million was asked for in the agricultural appropriation act. The extra recommendation of \$180,000 in the urgency deficiency bill was made because of an unusually rapid spread of the disease caused by severe tropical storms. Additional money was therefore needed at that particular time. Aside from that, the estimates of the department have been very close to the necessary expenditures throughout. I would hate to see this reduced.

Mr. JONES. In 1919 your appropriation was \$250,000 and you expended \$207,000 in that year?

Dr. KELLERMAN. Yes.

Mr. JONES. That left a margin of about \$40,000.

Dr. KELLERMAN. Yes.

Mr. JONES. And the following year your estimate was for \$196,000?

Dr. KELLERMAN. Yes, sir.

Mr. JONES. I presume that \$40,000 went back into the Treasury?

Dr. KELLERMAN. It went back into the Treasury.

Mr. JONES. That is the reason you reduced your estimates to \$196,000 the following year?

Dr. KELLERMAN. Yes, sir.

Mr. JONES. Then there was very little reduction in these two years from the actual amount of money expended?

Dr. KELLERMAN. Very little.

Mr. RUBEY. My recollection is that when we started out to fight this disease it was estimated that it would cost us something like \$4,000,000 to get rid of it?

Dr. KELLERMAN. Yes, sir.

Mr. RUBEY. We are getting rid of it at a cost of about a million dollars, so that we are three million ahead, and I think we are doing pretty good work.

Dr. KELLERMAN. I think so. I think the work is progressing more favorably than anybody thought it could.

Mr. HEFLIN. You said Alabama had spent only about \$5,000 in this cooperative work. Is it not a fact that the citrus-fruit area in Alabama is very small compared with that in some of the other States?

Dr. KELLERMAN. That is true. At the same time, it is a very promising industry in two large counties.

Mr. HEFLIN. Baldwin and Mobile?

Dr. KELLERMAN. In Baldwin and Mobile Counties. It is now developing there into what looks like a very promising and helpful industry. It did not look as though it could develop when the canker began to make inroads into new plantings in that region. The citrus industry in that region was looked upon as probably gone when the disease first started.

Mr. HEFLIN. Is there very much of this canker there now?

Dr. KELLERMAN. I think there is practically none in commercial plantings, except in a few abandoned plantings—plantings that were so severely damaged by storms a few years ago that they were neglected and allowed to go wild.

Mr. HEFLIN. You expect to eradicate it entirely?

Dr. KELLERMAN. I think we will be able to do it in a very few years now.

Mr. McLAUGHLIN of Michigan. Have you found any of it in California at all?

Dr. KELLERMAN. No, sir.

Mr. McLAUGHLIN of Michigan. Have you employed any bureau men there to search for it?

Dr. KELLERMAN. Yes, sir. We have had a few men searching in that State. We have depended mostly, however, on the collection of specimens by State men and having them sent to us for examination.

Mr. McLAUGHLIN of Michigan. Do you find the growers of oranges and other citrus fruit in California alive to the situation?

Dr. KELLERMAN. Very much so. California authorities, with the cooperation, I think very effective cooperation, of the railroads and all common carriers, have quarantines preventing the movement into California of any nursery stock or even fruit from the areas that are diseased.

The CHAIRMAN. We will take up the next item. Thank you, Dr. Kellerman.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

Dr. TAYLOR. Just before passing, Mr. Chairman, I would like to have the committee realize what the work under this citrus canker item means.

The CHAIRMAN. I think we understand the importance of it, Doctor.

Dr. TAYLOR. It means that for the first time in the history of the world, so far as we have information, a plant disease that had acquired a widely scattered foothold in an environment that was favorable to it is in prospect of eradication; and it means millions of dollars to the country if we can complete it along the lines that are being followed. We are still, however, in somewhat the situation of a forest-fire condition during a dry time. If there are scattered smoldering bonfires, a high wind may spread them and require quick action on a fairly large scale to prevent disaster to the industry. We

believe it is in the interest of real economy to have a sufficient amount available to meet such an emergency.

The CHAIRMAN. Item No. 82 is "for the investigation of diseases of forest and ornamental trees and shrubs," etc.

Dr. TAYLOR. There is no change, Mr. Chairman, in this item. Do you care to discuss it?

The CHAIRMAN. You might state briefly what you have been doing and what you propose to do.

Dr. TAYLOR. This is an investigational work on diseases of various fruit trees, including such investigational work as a study of parasitic fungi causing the chestnut tree bark disease, the white pine blister rust, and other epidemic tree diseases. Chiefly, the investigational work is concentrated upon the white pine blister rust disease at this time. That is a serious, menacing problem still, in the white pine territory.

Mr. McLAUGHLIN of Michigan. I thought you had given up that chestnut blight investigation.

Dr. TAYLOR. We are still continuing certain investigational work upon that disease.

Mr. McLAUGHLIN of Michigan. How much are you expending?

Dr. TAYLOR. About three or four thousand dollars, I should say.

Mr. McLAUGHLIN of Michigan. For what purpose? What kind of investigations are you making?

Dr. TAYLOR. Experimental research. Our investigators have not given up hope of ultimately accomplishing some form of control or prevention of that disease, through the breeding of resistant types that will afford us a supply of nuts, or possibly even the development of timber types that will replace the native species which is susceptible to the disease.

Mr. McLAUGHLIN of Michigan. The chestnut is not a nursery stock at all, is it? It is one of our native forest trees?

Dr. TAYLOR. There has been developed quite a large orchard industry in chestnuts in the Eastern States.

Mr. JONES. Does it form a nursery stock in the East?

Dr. TAYLOR. In the Alleghany region, generally.

Mr. McLAUGHLIN of Michigan. For the benefit of Mr. Jones, I will say that the State of Pennsylvania used to spend a great deal of money on the chestnut bark disease, both independently and in cooperation with the Department of Agriculture. The State of Pennsylvania came to the conclusion, however, that the disease could not be stamped out, and that the only thing to do was to destroy the trees, and that it was just a matter of spending money and employing labor; so they cut off the appropriation and stopped doing the work.

Dr. TAYLOR. That is true. The chestnut timber stand of the country is doomed. The timber interests and the tanning interests know they have to face that destruction.

Mr. JONES. The tanners can get along without it.

Dr. TAYLOR. This map gives the best forecast we can make of the destruction of the native chestnut timber area. Based on a reconnaissance made this year, the destructive frontier of the disease at the present time is roughly indicated by this line dated 1920. The rate of progress, based on past experience, will carry that destructive frontier to this point in 1925 [indicating on the map], to this

point in 1930, to this one in 1935, and to this one, which will cover substantially the heavy chestnut stand, by 1945. This reconnoissance has been made in order that the owners of chestnut timber—and it is the big and important timber in this southwestern portion of the Appalachian system generally—may know what they have to expect.

Mr. JONES. There is nothing north of the Pennsylvania line?

Dr. TAYLOR. No; that they may wisely and steadily market their stands in advance of their spoilage by the disease. It is an illustration of a plant disease which, had we possessed a plant-disease survey and \$15,000 of money at the time it first came to our attention, could have been eradicated before it got outside of western Long Island and Manhattan Island. We had no quarantine act then, and the disease got in from Japan. No such disease was known to exist. It got a foothold before we had a knowledge of its existence. A fight was made to control it, and the fight failed. There is, however, every reason to expect that it may be possible to develop resistant strains that will be profitable as nut-producing trees; and there is a possibility that there may be developed strong growing strains of oriental origin, derived from a Chinese species, which we are now experimenting with, that may, to an extent, replace, 50 years from now, the chestnut, which has been a very valuable timber tree.

Mr. HUTCHINSON. Is that timber good for any purpose after it dies?

Dr. TAYLOR. The sapwood rots rather promptly, so that it needs quick cutting after two or three years' attack. It may help the committee to remember also that all the forest-tree disease work of the Federal Government is comprised in this item. The Forest Service calls on the Bureau of Plant Industry for the investigation of each tree disease that requires attention, the Bureau of Plant Industry's laboratories being considered the right place for that work to be done.

The CHAIRMAN. What is your next item, Doctor?

Dr. TAYLOR. Item 83, "for applying such methods of eradication or control of the white-pine blister rust as in the judgment of the Secretary of Agriculture may be necessary," etc. For this work no increase is estimated.

The CHAIRMAN. How much did you expend this year?

Dr. TAYLOR. The expenditure for this year is the amount shown—\$220,728. That will all be required for this fiscal year. This work is cooperative with the States of the white-pine territory, New England, New York, and, to some extent, Pennsylvania, and in particular Wisconsin and Minnesota, where there are large stands of white pine and where there is at the present time a serious situation with respect to this disease.

Mr. LEE. I think I read in some eastern paper the other day that you had made good progress, the State and the Government, in New York State. Is that true?

Dr. TAYLOR. Very distinct progress has been made in the direction of working out a practical method of control of the disease, its eradication apparently not being possible.

Mr. ANDERSON. Has it spread any from the area to which it was confined last year?

Dr. TAYLOR. Not materially, I think, Mr. Anderson, this year. This situation has developed, however, in Wisconsin and Minnesota, that the disease has been discovered in the backwoods and back country, where it was not known a year ago to be.

Mr. ANDERSON. Is it supposed that it is a new and recent infestation, or is presumed to have been there for some time without being known?

Dr. TAYLOR. That is an old infestation that apparently was due to importing nursery stock, little pine trees that were shipped in years ago and planted in reforestation activities, which harbored the disease, although they did not disclose it for several years.

Mr. JONES. This does not go from pine to pine?

Dr. TAYLOR. It goes from pine to currant and gooseberry, and then from currant and gooseberry eventually back to pine.

Mr. JONES. But it must have this intermediary?

Dr. TAYLOR. Yes; so that its control requires practically the elimination of currants and gooseberries, cultivated or wild, throughout the forest area and for a considerable distance outside.

Mr. JONES. Is not the only answer to it the destruction of the currant and gooseberry production?

Dr. TAYLOR. We think so. It is the wild ones that cause the greatest difficulty.

Mr. JONES. Yes; but the tame ones harbor it, too.

Dr. TAYLOR. Yes; but they could be eliminated more easily and more quickly. The tough point in it is the eradication of the wild currants and gooseberries.

Mr. JONES. Have there not been thousands of dollars worth of currant and gooseberry bushes, cultivated berries, destroyed in New York State?

Dr. TAYLOR. There have been considerable quantities, and the State now forbids, in certain specified areas, the planting of currant and gooseberries where pines would be endangered; that is, where commercial pine plantings would be endangered by the presence of those shrubs. The States are attacking it; they are cooperating with us; and they are spending large sums of money and enforcing; that is, trying out each reasonable suggestion that is made. We are on the firing line with respect to this disease. The country is fortunate in the fact that the disease has not reached the western area of five-leaved pines, which include now the largest stand of pine timber that would be susceptible to it.

Mr. McLAUGHLIN of Michigan. By the western area you mean the far West?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. Where the Government owns national forests?

Dr. TAYLOR. Where the national forests are and where large areas are under private ownership, also. The Government has that big asset in this and we are maintaining a scouting service there. Until we know that there is not a diseased pine or currant or gooseberry west of the one-hundredth meridian, we can not be sure that that big national asset is safe. We ask that this work be continued on its present scale.

The CHAIRMAN. You ask for no increase?

Dr. TAYLOR. No, sir.

The CHAIRMAN. Just transfers?

Dr. TAYLOR. Yes, sir. The next is item 84, on page 74, "for the investigation of diseases of cotton, potatoes, truck crops, forage crops, drug and related plants, \$108,900." There is an increase of \$23,500 for projects in this field. This money is desired specifically, \$10,000 for investigating potato diseases. One of these, which is troublesome, stubborn, and menacing, is the potato wart disease, which is in very restricted areas in this country, so far as is known—in Pennsylvania and West Virginia. The disease is very destructive and troublesome in European countries. It has been so damaging in Britain that for many years they have prohibited the planting of potatoes other than resistant varieties in soils infected with this disease. When the war emergency arose, as I discovered last year when over there, it was found necessary for the Government to step in and have grown under contract seed potatoes of resistant varieties, to furnish to the farmers owning infected soil, in order to maintain a normal supply of this important food crop.

Mr. McLAUGHLIN of Michigan. Have they a resistant seed that can be planted in an infected soil and still not show the disease in the crop?

Dr. TAYLOR. They have developed, in Great Britain in particular, certain varieties that are good varieties for them, good yielding and good quality varieties, that resist the disease sufficiently to make a good crop. That is the last line of defense in this proposition, if we should not succeed actually in eradicating the disease and so be free from the possibility of a spread in a destructive way in this country.

Mr. McLAUGHLIN of Michigan. You spoke of a resistant soil?

Dr. TAYLOR. I mean infected soil, Mr. McLaughlin. It is a soil-infecting disease. It got into this country through the use for seed of large shipments of European potatoes that came in about 1912, I believe it was, when we had a short potato crop and cargoes of British potatoes were imported. Some of those were planted for seed, particularly by miners in the mining villages in Pennsylvania and, to some extent, in West Virginia. Fortunately the infection so far is restricted to those relatively noncommercial areas.

Mr. LEE. Is not this the same disease that came over the Canadian border and appeared in Maine?

Dr. TAYLOR. No; it did not get into the Maine crop. They have it over in portions of Canada, but our quarantine law was enacted in time to exclude, as it does now, and to protect us against the reimportation of the seed.

Mr. McLAUGHLIN of Michigan. Can you tell us, briefly, how you combat it?

Dr. TAYLOR. The methods of attack so far is proceeding along three lines, and it is experimental. First, of course, is the complete destruction of the growing crop and keeping potatoes off that land for an indefinite time. It is not known how long the infection endures in the soil. The practicability of this method depends on the willingness of the owner or occupier of the land to do that thing. Second, the actual disinfection, through steam, or with formaldehyde or some similar material, forced into the soil to a sufficient depth to kill out the infection.

Mr. McLAUGHLIN of Michigan. Steaming and applying formaldehyde to the soil?

Dr. TAYLOR. Steaming the soil under large inverted pans, such as tobacco growers use for a similar purpose. This is a garden proposition primarily.

Mr. McLAUGHLIN of Michigan. It would have to be a pretty small garden proposition to permit of that remedy.

Dr. TAYLOR. That is true. Practically it is the application of the method which the tobacco growers use in certain sections to sterilize the plant beds in which they grow their plants for the open field.

Mr. McLAUGHLIN of Michigan. That might be very interesting as an experiment, but how about the practicability of it?

Dr. TAYLOR. We are not far enough along in it yet to report specifically, but the question may probably arise, will it be better for the State of Pennsylvania to actually clean up a few acres of land and be sure there is no infection which could spread to her commercial potato territory, even though that cost several hundred dollars an acre?

Mr. McLAUGHLIN of Michigan. What is in the nature of cleaning up—to get a resistant seed?

Dr. TAYLOR. No, sir; to eliminate this disease from the United States and be sure it can not spread to our important commercial territory. It is just like the question of what expense would be justified in clearing up one village that was infected with bubonic plague.

Mr. McLAUGHLIN of Michigan. They do that by destroying the growing crop entirely and by refusing permission to plant or refraining from replanting on that soil?

Dr. TAYLOR. That is one method that is under test.

Mr. McLAUGHLIN of Michigan. That is the way the locality could be cleaned up; but it would seem to me that that could not be done on any large scale at all. You could not clean up an area by that method, could you?

Dr. TAYLOR. Fortunately, the areas are not large. In the West Virginia territory as it stands, where the infected area amounts to a few acres only (I do not recall the exact acreage), it might easily pay to spend \$500 an acre in sterilizing these areas and so eliminate the possibility of millions of dollars of damage in the commercial territory if the disease should get over from the present infected area. If we were in a position to say to you, "Gentlemen, \$100,000 would clean out this disease from 100 acres of land, and it is restricted to that area, we would not hesitate to recommend it as a good investment for the country. The investigation has not proceeded far enough, however, to make that recommendation.

Mr. McLAUGHLIN of Michigan. By experimentation, you have found that the land can be treated successfully in that way?

Dr. TAYLOR. We are experimenting in an effort to determine whether it can be disinfected deep enough by the use of practical devices already in use for other crops.

Mr. McLAUGHLIN of Michigan. I do not want to take up too much time.

Dr. TAYLOR. It is an important question.

Mr. McLAUGHLIN of Michigan. But you spoke about steaming the land.

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN. How in the world do you do that over a large area?

Dr. TAYLOR. Area by area, with shallow box pans inverted so that they are kept filled with steam, which works down into the soil, as has been demonstrated to be thoroughly practical in the tobacco industry for restricted areas. It is a method followed by the Connecticut tobacco growers, and to a considerable extent in Tennessee, also—a method which was developed by the department some years ago.

Mr. McLAUGHLIN of Michigan. The formaldehyde treatment of the soil that is simply—

Dr. TAYLOR. That is used in combination with the steam in the same way, so as to force it into the soil.

Mr. JACOWAY. Has your attention been called to a disease which attacked the potato slip in the South in July or August?

Dr. TAYLOR. The sweet potato?

Mr. JACOWAY. Yes, sir.

Dr. TAYLOR. Yes, sir; there are several such that are worked on under this same appropriation.

Mr. JACOWAY. Could that be eradicated by treatment of the soil or treating the plant?

Dr. TAYLOR. The disease you have in mind, I think, is one which is traceable to an infection in the sweet potato that is bedded for seed.

Mr. JACOWAY. Will the certified seed potato prevent that?

Dr. TAYLOR. If the certification is thoroughly efficient; that is, if your seed is clean.

Mr. JACOWAY. Here is the trouble, and especially in my county: Last year and also to a lesser extent the year before the growers found in August that the plant shriveled and died; and when they pulled it up they found it infected, I think, with some kind of a wart on it. Is that trouble inherent in the soil or can it be prevented through buying the proper kind of seed potatoes when they are bedded out?

Dr. TAYLOR. The disease to which you probably refer is sweet potato stem rot, sometimes called the wilt. It occurs in Arkansas and is very serious in some parts of the State on the Nancy Hall variety, which is about the only variety grown to any extent in the State which is susceptible to the disease. The organism causing this disease lives over the winter in potatoes in storage in the soil, and on dead debris in the field. If infected potatoes are used for seed, the young plants produced from them may become diseased. Infected plants taken from seed beds usually show very characteristic symptoms of the disease in the field in about 10 days to two weeks after being planted. Much can be done toward the control of stem rot by the selection of sound seed and the improvement of propagating methods through the use of clean soil, seed disinfection, etc. The problem of field infection remains to be met by rotation of crops or the substitution of wilt-resistant varieties, like Porto Rico.

It is possible that some of the trouble to which you refer is black rot, a disease which is also prevalent in Arkansas. This is more evident in the seed beds and does not appear so soon in the fields after the plants are set out. Black rot attacks all varieties of sweet potatoes, so far as we know, but can be controlled very satisfactorily by

the use of clean seed, seed treatment, and hot-bed sanitation, as fully set forth in Farmers' Bulletin No. 1059.

Mr. CANDLER. You said there was a third remedy of some kind.

Dr. TAYLOR. The third and last line of defense of a disease like the potato wart is resistant varieties which, while not completely immune to the disease, can be grown with fair success in the presence of the disease. We are testing all the American varieties and are bringing in the European immune varieties in an effort to determine whether some of them could be grown on these infected soils safely. Certain of our American varieties are promising in that respect and we have more to expect, I think, from them than we have from the imported immune varieties, for the European varieties have been developed with reference to the European soils and climatic conditions, and very few of them ever really behave well in our more fluctuating and extreme climate.

Mr. CANDLER. Are these resistant varieties as nutritious and otherwise as good as the other varieties?

Dr. TAYLOR. As grown under their soil and climatic conditions, yes.

Mr. CANDLER. Do ours meet the same standard here?

Dr. TAYLOR. Yes; I should say so.

Mr. CANDLER. To make them resistant does not make them tough and hard to use?

Dr. TAYLOR. No; the question primarily is whether they will succeed on infected soil under our conditions.

Then there is a group of very difficult diseases of potatoes to an extent characterized by the general term of "mosaic diseases," on which we need to increase our work. These are particularly troublesome in the large commercial territory of New Jersey, on Long Island, N. Y., in Aroostook County, Maine, and in the irrigated territory of the West.

Mr. HUTCHINSON. In New Jersey last year we had a disease of some kind from which we lost about 50 per cent of the potatoes. They would rot right in the field. What was the cause of that? Was that caused by a disease or was it due to the weather?

Dr. TAYLOR. That was probably late blight, which is controllable by sprays. That is, within a reasonable extent, thoroughly satisfactory methods of control by spraying have been developed.

Mr. HUTCHINSON. These potatoes were dug and shipped, and a great many hundreds of cars were lost on the railroad; and after a while, if left in the field, they stopped rotting. The loss from this rot was about 50 per cent. A great many people said it was due to the heavy rains. I would like to know what you think it was, whether it was the heavy rains, blight, or what is was.

Dr. TAYLOR. Of course, a soggy condition of the soil during the latter part of the potato season makes certain considerable rot in the crop, whether in transportation or in storage, due to the fact that it carries into every cut and bruise and wound that the potato suffers every fungus or bacterium that is there that can attack and produce decay in the potato.

Mr. HUTCHINSON. There was no prevention for the weather.

Dr. TAYLOR. No; the weather damage occurs if a potato crop stands in a soggy soil for weeks at a stretch, as sometimes occurs in almost every section of the country.

Mr. JACOWAY. Did your potatoes have warts all over them?

Mr. HUTCHINSON. No; they were smooth and nice.

Dr. TAYLOR. Our second item under this paragraph, for which we need funds, is \$3,500 for the investigation of the eelworm disease of red clover.

The CHAIRMAN. This is new, is it?

Dr. TAYLOR. It is new to this country and, so far as we know, is in the main confined to Idaho, although some specimens have been received from the State of Washington.

The CHAIRMAN. Have you made a study of the disease?

Dr. TAYLOR. A preliminary study was begun as soon as the nematode which evidently causes it was found on the roots of the clover plants.

The CHAIRMAN. It covers a large area?

Dr. TAYLOR. We do not know yet how large an area is covered.

The CHAIRMAN. At any rate, it is of importance and should be investigated?

Dr. TAYLOR. It is a matter of fundamental importance for the reason that these nematodes have been found alive on clover seed from this territory, and this is an important clover-seed producing territory.

The CHAIRMAN. You think it is possible to exterminate it?

Dr. TAYLOR. We do not know yet, sir. We must know more of the habits and life history of this nematode.

The CHAIRMAN. You speak of a large area; what do you mean by "large area in Idaho?" Do you mean that it covers several townships, counties, or what?

Dr. TAYLOR. It is scattered through certain irrigated districts. We do not know its limits; we have not had the funds with which to make a survey.

The CHAIRMAN. To what extent is the crop destroyed?

Dr. TAYLOR. The crop in extreme cases is practically entirely destroyed. The trouble was until recently confused with winterkilling. The clover stand was gotten and the crop seemed to be coming along fairly well, then it began to yellow and the roots went bad, and finally it was found that there were these minute eelworms on the roots.

The CHAIRMAN. Just in spots or in the whole field?

Dr. TAYLOR. Just in spots, as a rule, but frequently spreading to the whole field, and apparently easily transported in the irrigation water and, therefore, dangerous. I wish to make this point, further: If that thing is transported through clover seed, then look out in the Middle West and the rest of our country, for much of our clover-seed supply is coming from the irrigated territory.

Mr. ANDERSON. There is no quarantine against the shipment of clover seed from this territory, is there?

Dr. TAYLOR. No, sir; and we do not know if this thing would live in Minnesota and be destructive—or in Illinois or in Virginia. It is a new problem.

The CHAIRMAN. Your next item is for \$10,000?

Dr. TAYLOR. The final item of increase of \$10,000 under this sub-appropriation is for pathological inspection of vegetables in processes of marketing.

The CHAIRMAN. In cooperation with the Bureau of Markets?

Dr. TAYLOR. Yes, sir. This is exactly comparable with the pathological inspection of fruits, for which an increase was requested under item 80.

The CHAIRMAN. How many items have you in your bureau now in cooperation with the Bureau of Markets?

Dr. TAYLOR. These are the two of this character. We cooperate with the Bureau of Markets on several kinds of work. We do technical research work for them.

The CHAIRMAN. Is that paid for out of the funds of your bureau?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. In all instances?

Dr. TAYLOR. Except in cases where an emergency comes up that requires immediate attention where, if we have not the funds and the Bureau of Markets has the funds temporarily available, we ask them to carry that.

The CHAIRMAN. Will you furnish the committee with a statement giving the number employed and the amount of money expended in cooperation with the Bureau of Markets?

Dr. TAYLOR. We can do that; yes.

The CHAIRMAN. Can you approximate the amount now?

Dr. TAYLOR. I could not offhand; no, sir. It is several relatively small items. I will have that inserted in the record.

(The statement referred to follows:)

Cooperative pathological inspection work between the Bureau of Plant Industry and the Bureau of Markets.

Line of work.	Number of employees.	Expenses.
Pathological inspection of fruits during processes of marketing.....	1	¹ \$3,460
Pathological inspection of vegetables during processes of marketing.....	4	7,440
Total.....	5	10,900

¹ It should be pointed out that, while the pathological section of the cooperative work with the Bureau of Markets on this project is being carried on actively by the Bureau of Plant Industry, the Bureau of Markets side of the cooperation is temporarily suspended owing to a lack of funds.

The CHAIRMAN. Could not some arrangement be made whereby the appropriation could be made direct to one bureau and not be split up between a number of bureaus of the Department? I appreciate that you have the experts and very probably you should do the work we would like to keep track of it and know the amount expended for each unit or each project.

Dr. TAYLOR. We practically have to administer the technical work, the technical pathological work, in the Bureau of Plant Industry.

The CHAIRMAN. Could not that amount be paid out of funds of the Bureau of Markets and still be under your supervision and control?

Dr. TAYLOR. If it would insure full responsibility and clearer understanding. It strikes me it would be rather more difficult, however, for me to administer a portion of the Bureau of Markets fund than it would be for me to keep track of an appropriation which I control and administer.

The CHAIRMAN. Have you conferred with the Bureau of Markets about that feature?

Dr. TAYLOR. Yes; repeatedly; and the principle which is agreed to throughout the department service is that the funds should be in the place where the administrative responsibility rests. The only exceptions are in cases where temporary emergencies have to be met.

The CHAIRMAN. The situation is this: A great deal of activity is carried on by your bureau and the other bureau takes the credit for the work.

Mr. TAYLOR. Oh, I think they are fairly generous in respect to the credit.

The CHAIRMAN. I have reference to the reports made to us, from which it would appear that small appropriations were made and great results were obtained from the small appropriations.

Dr. TAYLOR. If these funds are provided for the Bureau of Plant Industry, we will be sure to get the credit for the work which we do; and, as we are responsible for the work which we do, we believe we should have these funds.

The CHAIRMAN. I think we all agree that we should have some check upon these appropriations and know exactly what is being spent for each project, without going through all the bureaus. If all the work on one project could be carried under one head—

Dr. TAYLOR. Yes; but this is a pathological activity which should be reflected back in the most direct way possible to the production end of the field, in our judgment.

The CHAIRMAN. If we eliminated the words "in cooperation with the Bureau of Markets," you could still cooperate with the Bureau of Markets, could you not?

Dr. TAYLOR. Oh, yes.

The CHAIRMAN. Why are the words "in cooperation with the Bureau of Markets" inserted?

Dr. TAYLOR. I do not know, unless in this particular case it might be more easily understood.

Mr. HARRISON. There is no necessity for that language; it is put in there merely to indicate that the work is to be done cooperatively.

Mr. LEE. It does not do any harm, does it?

The CHAIRMAN. I want to get it into the record, is all.

Mr. McLAUGHLIN of Michigan. Can you tell us, briefly, just what you do?

Dr. TAYLOR. Yes, sir; and I will illustrate that with this exhibit of material [showing pamphlet], prepared in connection with this work, which is accessible to the whole Bureau of Markets force and which, incidentally, I might say, the produce industry is urging us to publish in some way so that it will be available to all the people rather than merely to our inspectors.

Mr. McLAUGHLIN of Michigan. Your work is purely investigational?

Dr. TAYLOR. Investigational and educational.

Mr. McLAUGHLIN of Michigan. As I understand it, you instruct those people?

Dr. TAYLOR. Yes, sir. This is investigational and educational; not regulatory at all. Our men diagnose the diseases of vegetables which the Bureau of Markets inspectors can not accurately determine. They determine the causes of deterioration which are trace-

able to bad handling, improper packing, improper loading in the cars, improper grading, and so forth. In numerous cases, however, the question arises, "Is the rotten condition of this carload of potatoes due to bad handling, or is it due to some particular disease which may have affected the crop in the field and which should have been controlled in the field?" Those in the produce trade do not know; they call rots "rots." In many cases the farmers themselves do not know. Nobody knows all the diseases of these crops. Our men diagnose as accurately as may be and instruct the inspectors as to these diseases, prepare information which they can steadily have at hand for reference, like these colored illustrations, descriptions, and so forth, and maintain that supervisory relation to their technical work which is required.

The CHAIRMAN. Your investigational research work is independent of the Bureau of Markets?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. You disseminate the information and educate these people employed by the Bureau of Markets?

Dr. TAYLOR. Yes, sir; and immediately a new disease or epidemic development of an old disease occurs, our man reports back to our investigational office here and, if there is some feature of that which needs attention in the field or in the laboratory, he can get it instead of waiting some time perhaps a year from now.

The CHAIRMAN. You advise the inspectors of the Bureau of Markets?

Dr. TAYLOR. We advise their inspectors and carry it back into the field to the farmers where the crop grew.

Mr. CANDLER. The object is to determine the source of the trouble?

Dr. TAYLOR. Yes, sir.

Mr. CANDLER. And whether it starts at the source of production, on the farm, or whether it arises from improper methods of handling or transportation?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. We will take up your next item.

Dr. TAYLOR. The next item which carries an increase is No. 86, on page 76, "for soil-bacteriology and plant-nutrition investigations," in which we ask for \$49,060, an increase of \$10,000 over the current appropriation. This is desired for use in the enlargement and broadening of crop rotation studies in which fertilizer applications, in particular, are involved. It is aimed primarily at the solution of the problem of crop relationships, or crop successions—the effect of one crop upon the succeeding crop, which, under fertilizer farming in particular, is often very important. It is an attack upon a fundamental of crop rotation practice.

Mr. JACOWAY. Why do you need \$10,000 more?

Dr. TAYLOR. To broaden the work; to include more crops under more conditions than we are able at present time to carry on. That work has so far been restricted practically to crops used in rotation with tobacco.

The CHAIRMAN. Is this work done in cooperation with the Bureau of Soils?

Dr. TAYLOR. No, sir; except in an informal advisory relationship. This is a plant-nutrition problem.

The CHAIRMAN. There is a line of demarcation, then, between the two?

Dr. TAYLOR. Yes, sir; one that is clearly recognized and, I think, entirely satisfactory to both bureaus.

Mr. HUTCHISON. Is not the Bureau of Soils doing the same kind of work?

Dr. TAYLOR. No, sir; not at all. No other element of the department is doing the same kind of work.

The CHAIRMAN. You might point out what part of the work you conduct on fertilizer.

Dr. TAYLOR. The Bureau of Soils studies fertilizer resources and fertilizer composition, the chemical composition of fertilizer; the Bureau of Plant Industry studies the effect of fertilizers upon crops.

Mr. McLAUGHLIN of Michigan. This would have to be done in a practical way—to try out the fertilizer and try out the rotation, would it not?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. Where do you do that?

Dr. TAYLOR. So far, we are doing it chiefly at a field station (the tobacco crop is the main crop) maintained in the State of Maryland. We call it a field station; it is a farm, and it is jointly handled by the Maryland Agricultural Experiment Station and the Bureau of Plant Industry. It is a farm upon which there are the usual farm buildings—all that are necessary for work of this character.

Mr. McLAUGHLIN of Michigan. You carry on your experiments on that farm?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. How is the Bureau of Soils to ascertain the value of the fertilizer except from you?

Dr. TAYLOR. In so far as the value of the fertilizers upon crops is concerned, the responsibility rests on the Bureau of Plant Industry.

Mr. McLAUGHLIN of Michigan. And it gets its information from your bureau?

Dr. TAYLOR. Yes, sir; but we, in turn, get our information regarding chemical composition, sources from which the material can be obtained, etc., from the Bureau of Soils.

Mr. McLAUGHLIN of Michigan. And the results of those differ?

Dr. TAYLOR. Yes, sir.

Mr. HUTCHINSON. Have you had any experiment with potashes this year—Nebraska potashes and local potashes?

Dr. TAYLOR. Yes, sir.

Mr. HUTCHINSON. How do they compare with foreign potashes?

Dr. TAYLOR. We are not comparing them with foreign potashes, because we have not been able to get them this year.

Mr. HUTCHINSON. You used to get them?

Dr. TAYLOR. Yes. There is a very serious problem in that connection which is indicated in our next item here, item 87, on page 78, for soil-fertility investigations.

Mr. McLAUGHLIN of Michigan. Speaking of the value of the fertilizer, most of us are more interested in the cost of it. The cost has gone way up in the air.

Dr. TAYLOR. This item 87, "for soil-fertility investigations into organic causes of infertility and remedial measures," etc., includes

an increase of \$20,000. This increase is needed to meet a very rapidly increasing demand for information regarding the usefulness of new fertilizer materials. The world shortage of fertilizer materials has resulted in the combing of the world for things that might possibly have value as fertilizers. Prices are high for most of the materials; they are very high; but that is not the worst of it. In certain of these materials, toxic elements exist which, while not known to be there until this last growing season, have caused serious damage to the crops. As soon as there was knowledge that there was probable danger, the bureau undertook a series of experiments with potashes found to contain percentages of borax, the results of which we are about ready to publish in so far as the experiments of this year are concerned. Briefly summarized, the situation may be understood perhaps through the examination of some of these photographs which show the effect of fertilizers now known to have contained borax [submitting photographs].

MR. CANDLER. Some of these fertilizers that are being used are really injurious then, rather than beneficial?

DR. TAYLOR. Yes, sir.

MR. CANDLER. And you are trying to find out the injurious ones so as to discriminate between them and the beneficial ones?

DR. TAYLOR. Yes, sir; the one which is known to have caused the greatest destruction is borax. From one potash-producing section of the country, the Searles Lake region of California, the potash output has been, under earlier methods of production, seriously contaminated with borax. Some of that potash was applied to cotton and tobacco and other crops in the South this year, in South Carolina and North Carolina, with disastrous effects. Some of it got on to the potatoes in Virginia, New Jersey, New York, and Maine. The experiments which these photographs illustrate have developed the fact that very minute quantities of borax are destructive if applied in the hill or the drill and abundant rain does not come very promptly after the application to dissolve the borax and send it below the reach of the roots of the crop.

THE CHAIRMAN. Are you making experiments and examinations as to the various sources?

DR. TAYLOR. No; we are testing.

THE CHAIRMAN. Have you any data on the subject?

DR. TAYLOR. We are testing the effects on the crops.

THE CHAIRMAN. Of potash from various sources?

DR. TAYLOR. Yes, sir.

THE CHAIRMAN. So that you can advise us from what source to get our supply?

DR. TAYLOR. Yes, sir. This whole matter has become so serious that within the last 10 days the Secretary of Agriculture, acting under the war power, under the Lever act, has required all licensees under the fertilizer clause to indicate on the containers if there is more than one-tenth of 1 per cent of borax contained in that fertilizer, the percentage that it contains. That one-tenth of 1 per cent is an expression of our best judgment, with the facts we have at hand of the amount of borax that may be applied to crops without injury, which rests substantially on a single season of laboratory and field experimentation.

Mr. McLAUGHLIN of Michigan. More than that would be harmful?

Dr. TAYLOR. Under certain conditions. Three pounds of borax per acre has seriously damaged corn in Indiana this year where applied in a mixed fertilizer in the hill in the customary way.

The CHAIRMAN. In other words, you are standardizing fertilizer, are you not? You prohibit the sale of certain kinds?

Dr. TAYLOR. The Secretary, acting under the war power—

The CHAIRMAN. Yes; I understand.

Dr. TAYLOR (continuing). Which, of course, ends soon, has gone to the limit of his authority to protect the farmer and to protect the fertilizer industry as well (because what hurts the farmer kills the industry eventually), in order to steady this situation.

The CHAIRMAN. Then, in order to protect the use of fertilizer, is it necessary for the department to standardize the fertilizer?

Dr. TAYLOR. I would not say that yet.

The CHAIRMAN. You want to prohibit the use of certain injurious ingredients?

Dr. TAYLOR. Yes.

The CHAIRMAN. That can only be done by standardizing. How could you write into a law the ingredients that are to be prohibited unless you standardize the ingredients?

Dr. TAYLOR. Of course, that is a very complicated question when you go into it in all its ramifications. Heretofore there has been no Federal control whatever until the war emergency arose.

The CHAIRMAN. That control has ceased, we will say. Now, what are you going to do with this appropriation?

Dr. TAYLOR. Through this appropriation we hope to get at the facts which are required.

The CHAIRMAN. What are the results of the expenditures so far?

Dr. TAYLOR. All we have done so far, you understand, we have done by makeshift. This matter flashed up after the current year's appropriation was made, so that we have concentrated on it merely with the resources and the men we had.

The CHAIRMAN. You have had funds available and have given it considerable study in years past?

Dr. TAYLOR. We have made a beginning this year. No work was done on borax in fertilizers prior to this year.

The CHAIRMAN. By the department or any other agency?

Dr. TAYLOR. Neither by the department nor any of the different State experiment stations, nor, as far as we can ascertain, by the fertilizing industry. It is a new proposition.

Mr. JACOWAY. Then you have not enough information at hand in the department to say what is a standard fertilizer?

Dr. TAYLOR. Absolutely not.

Mr. HUTCHINSON. The borax can be taken out of the potash, can it not? They have a process for taking it out, have they not?

Dr. TAYLOR. Our understanding is that they are able to free potash of borax down to an average of about two-thirds of 1 per cent.

Mr. HUTCHINSON. Have you been before the Ways and Means Committee?

Dr. TAYLOR. No, sir.

Mr. HUTCHINSON. Don't you think it is wise for you to go there? They have a bill, you know, before the Ways and Means Committee

whereby we are compelled to buy so much of the local potash. I think it would do the farmers a great deal of good if you would make your statement to them.

Dr. TAYLOR. The feature which is most disturbing is this: That the potash supply that is in sight, available or obtainable, for use next spring mostly contains borax.

Mr. HUTCHINSON. We are getting some foreign potash now?

Dr. TAYLOR. Very little, so far as we have information.

Mr. McLAUGHLIN of Michigan. Does the foreign potash contain a little borax?

Dr. TAYLOR. None at all.

The CHAIRMAN. How much does the local potash contain?

Dr. TAYLOR. During the past year it has contained all the way from one-third of 1 per cent up to 6 per cent or 12 per cent, or probably, at the beginning of last spring, above 20 per cent in some cases.

The CHAIRMAN. You say from one-half?

Dr. TAYLOR. From one-third of 1 per cent to 20 per cent.

Mr. McLAUGHLIN of Michigan. We are getting potash now from several sources, some of which are comparatively new?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. From what source do we get the most borax?

Dr. TAYLOR. We supposed, until three weeks ago, that it all came from the Searles Lake country, in California. It has developed that much has come in from Chile in the form of a so-called high nitrate potash, not imported prior to the war; a by-product of the nitrate of soda industry in Chile, which came in under the war demand for use in munitions. After the armistice was signed large stocks of this were available for use as fertilizer, which constitute one of the largest stocks of potash to-day. The extent to which that can be cleaned up or can be diluted down in the preparation of the mixed fertilizers, we can not say.

This further disturbing fact has developed also, that nitrate of soda as imported contains some borax, which was not known until within the last few weeks.

Mr. ANDERSON. Is it not a strange thing that no chemical analysis of a thing as universally used as this has been had which resulted in a discovery of this sort of situation?

Dr. TAYLOR. It is a most astounding situation. I am not a chemist, but it is fair to the chemical industry as a whole and to the experiment stations and fertilizer manufacturers to say that methods for the exact determination of borax have not existed. Its importance as a toxic element in fertilizer has not been realized. If anyone had told me a year ago that 3 pounds of borax per acre would have damaged a corn crop, I would not have believed it without experimental evidence.

Mr. CANDLER. Where is the danger line; you stated it a while ago?

Dr. TAYLOR. The danger line for application in the hill and drill is somewhere a little below 3 pounds per acre. We do not know just where it is.

Mr. JACOWAY. Won't it differ with different fields and different soils?

Dr. TAYLOR. Yes, sir.

Mr. JACOWAY. Then, can you arrive at a universal judgment as to how much to use?

Dr. TAYLOR. No, sir.

Mr. LEE. It would do little damage on a wet place?

Dr. TAYLOR. If you plant to-day and rain comes to-night, you are not likely to be harmed by considerable percentages; but we must know so that the farmer can be informed.

Mr. CANDLER. It is necessary to know the nature of the climatic conditions, the general average of the situation, and exactly where it is dangerous to use it at all?

Dr. TAYLOR. Yes; and where the danger lies with the condition of the soil, the character of the soil, whether a crop—

The CHAIRMAN. Does it affect the soil for a crop for more than one year?

Dr. TAYLOR. We do not know that. The general belief is that on leachy soils there is no important cumulative effect. But it is not safe to accept that as true until we have proved it.

Mr. RUBEY. You take a large field of tomatoes that has been fertilized, and the next year the same land is the finest field in the world for wheat.

Dr. TAYLOR. Yes; very excellent crops of wheat are grown in the canning country where tomato crops are followed by wheat.

Mr. McLAUGHLIN of Michigan. You are getting some potash now from the cement factories. Is borax found in that?

Dr. TAYLOR. Not so far as I have information. Dr. Whitney, of the Bureau of Soils, could give you more information on that question.

Mr. McLAUGHLIN of Michigan. Have you found borax in the potash made from kelp?

Dr. TAYLOR. No, sir.

Mr. HUTCHINSON. I understood you a while ago to say that the Government was going to issue an order to indicate the borax content on the bag?

Dr. TAYLOR. That order has been issued.

Mr. HUTCHINSON. How can you do that; under the war power?

Dr. TAYLOR. The war power requires the licensing by the Secretary of Agriculture of manufacturers and dealers in fertilizer, and they have been under license now for something like two years. They are subject, therefore, to the order of the Secretary.

Mr. HUTCHINSON. I realize that; but we all expect the war to be over now very shortly. Then what are you going to do for goods to be delivered next spring?

Dr. TAYLOR. We have gone as far as we can at this time, and we feel that we have driven a stake which is conspicuous and by means of which we can hope for recognition of the importance of this feature in the future.

Mr. CANDLER. After all these regulations expire all you could do would be to warn the people and give them information, so that they might avoid the danger themselves?

Dr. TAYLOR. Yes, sir.

Mr. CANDLER. This \$20,000 increase is for the purpose of securing information to advise the people?

Dr. TAYLOR. Yes, sir.

Mr. HUTCHINSON. I think you are doing great work, and that is the reason I wanted to know how you could force the manufacturers to put the contents on the bag, because I do not see how you can do it after the war stops.

Mr. LEE. The States can do it.

Mr. HUTCHINSON. The States can do it?

Dr. TAYLOR. Yes. Of course, at the present moment the war power continues, and the fertilizer for the spring application is now going into the bags. In fact, it is going on the land in the extreme South at the present time—in the Florida trucking region and in the southern coastal plain.

The CHAIRMAN. Is there anything to be studied concerning nitrogen or phosphoric acid?

Dr. TAYLOR. Nothing new, except in so far as their use is concerned.

The CHAIRMAN. Why could not a number of these items be consolidated? For instance, in dealing with fertilizer, why not put it all under one item?

Dr. TAYLOR. We feel, as the result of actually handling the men and work, Mr. Chairman, that in cases where the fertilizer feature is incidental to the other features involved, it is better to have that money there in that place.

The CHAIRMAN. But the segregation naturally incurs additional expense and overhead charges?

Dr. TAYLOR. No; because you must maintain the crop work with regard to which the fertilizer feature is but one element and in many cases an incidental element. It does not involve an increase of overhead at all under our form of organization; there is no duplication of experimentation and no duplication of personnel or expenditures.

The CHAIRMAN. But, when one is put in charge of a certain line of activity, it carries a little more importance and a little more salary.

Mr. LEE. That is not true, is it?

The CHAIRMAN. It gives a little more importance to the position.

Dr. TAYLOR. I do not think so.

The CHAIRMAN. Does it not add to the salaries?

Dr. TAYLOR. No, sir.

Mr. HUTCHINSON. Is your department trying to explain to people the difference in ammonia? For instance, there is from \$12 to \$14 a ton difference, depending on where you get the ammonia, whether from nitrate of soda, dried blood, fish scrap, or tankage. In other words, ammonia from tankage costs from \$7 to \$7.50, while nitrate of soda costs about \$3.

Dr. TAYLOR. Yes.

Mr. HUTCHINSON. Is your department explaining to the people the values of these different ammonias or not?

Dr. TAYLOR. The difference in money value?

Mr. HUTCHINSON. I mean the field value.

Dr. TAYLOR. The production value?

Mr. HUTCHINSON. The production value.

Dr. TAYLOR. Yes; to the extent that there is knowledge with respect to this difference. It is largely a question of the crop and of the—

Mr. HUTCHINSON. You know it is a pretty hard proposition now to go out and sell on a unit basis, when it varies from \$3.50 to \$7.

Dr. TAYLOR. Yes.

Mr. HUTCHINSON. And I think a fertilizer is no good unless it is made out of tankage; I would not give anything for fertilizer made entirely out of nitrate of soda.

Dr. TAYLOR. Yes.

Mr. HUTCHINSON. It seems to me the Government ought to explain that.

Dr. TAYLOR. This feature is undoubtedly becoming important as more and more of the tankage and fish scrap and cottonseed meal is put into the feed bin, instead of into the fertilizer bin—and that is where it is going.

Mr. HUTCHINSON. Yes.

Dr. TAYLOR. That is one of the reasons for the very high price of these organic ammoniates at the present time. The feeders are using them increasingly. That is also true in Europe. We will have to fall back on the so-called inorganic ammoniates more and more, and to use them effectively we will have to feed our plants in smaller doses and more frequently, which we do not see how we can do at present labor costs.

Mr. JACOWAY. You would not recommend the use of cottonseed meal in fertilizer at the present price of cottonseed meal, would you?

Dr. TAYLOR. Where will you get your ammonia otherwise?

Mr. JACOWAY. I am asking you the question. Cottonseed meal is sky high, and, if you put it into fertilizer, it looks to me, from my standpoint, that it would be bad policy; that you would get more value by feeding it to the animals than by putting it on the soil.

Mr. HUTCHINSON. No; in the long run, Mr. Jacoway, you are depreciating your ground and reducing your production.

Mr. JACOWAY. That is what I am asking him.

Dr. TAYLOR. As a general proposition, I feel that the largest return and the best result on agriculture would be through the feeding of the cottonseed meal and the use of the animal manure that comes from it and marketing the meat and the milk that comes from it. But you can not do that overnight for your whole crop; that is, you can not change from a fertilizer-sack basis to a manure-pile basis overnight. It is a thing that has got to be worked out.

Mr. CANDLER. Is there any serious shortage of fertilizers all through the country?

Dr. TAYLOR. You can get much more exact information from Dr. Whitney than from me on that matter.

Mr. CANDLER. I thought possibly you might have some general information on it.

Dr. TAYLOR. I will say this, as to the phosphate supply, that there is a very serious shortage, resulting to a considerable extent from strikes in the Florida mine country, which continued for months and reduced the production until rather recently.

Mr. CANDLER. That makes these various ingredients more expensive, and that makes production more expensive, which, in turn, raises the price?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. We will pass on now to item 88, page 79, "for acclimatization and adaptation investigations of cotton, corn, and other crops introduced from tropical regions," etc., \$104,410.

Dr. TAYLOR. There is no change in that.

The CHAIRMAN. The committee will now recess.

(Thereupon, at 12.30 o'clock p. m., the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

BUREAU OF PLANT INDUSTRY—Continued.

The committee reassembled at 2.30 o'clock p. m., pursuant to recess.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. Will you proceed, Dr. Taylor?

Dr. TAYLOR. Our next item is item 89, page 80. The appropriation—

Mr. JACOWAY. Did you take up item 88, Dr. Taylor, "For acclimatization and adaptation investigations of cotton, corn, and other crops introduced from tropical regions, and for the improvement of cotton and other fiber plants"?

Dr. TAYLOR. We did not discuss that. There is no change there.

The CHAIRMAN. You might explain something about New Zealand flax in the United States.

Dr. TAYLOR. The New Zealand flax or phormium has been looked into and investigated in the field without disclosing much promise of commercial development. It is not thriving sufficiently in the southern California territory, where the largest patches of it were—on high-priced land and under irrigation—to give any promise that it will be profitable.

The CHAIRMAN. Have you been importing the plants or importing the seed and planting it?

Dr. TAYLOR. We are not importing plants. We are starting experimental planting in the East, where the climate is more humid, like New Zealand.

The CHAIRMAN. Where do you get your seed?

Dr. TAYLOR. In New Zealand and from the scattered patches in this country, which were grown from plants imported in former years, some of it in Florida and some in Louisiana.

The CHAIRMAN. How much did you expend on this last year?

Dr. TAYLOR. We have expended so far this year under this proviso, I think, about \$300.

The CHAIRMAN. And the balance goes back into the Treasury?

Dr. TAYLOR. Of course, the year is not quite half through. There will be some return to the Treasury under this proviso.

The CHAIRMAN. You have never had very much faith in it, have you? It was put in here against the recommendation of the department, was it not?

Dr. TAYLOR. We did not recommend it. The crop in New Zealand is essentially a wild crop. It pays to harvest it and work up the fiber because it has not cost anything to produce it up to that stage.

It has not become, so far as we are able to learn, an important and successful crop to plant and grow for fiber production anywhere.

The CHAIRMAN. Are you making progress on the other items here?

Dr. TAYLOR. Dr. Kellerman calls my attention to this record of the experiments this year with the New Zealand flax:

Several hundred seedlings, sufficient for trial plantings, are growing at Chico, Calif. It is learned that phormium plants are injured by temperatures below 20° F., and still more by temperatures above 85°. The only region in this country, so far as can be learned, having a temperature sufficiently equable for phormium is around San Diego, Calif., and in that region there is a lack of moisture and of humus in the soil over commercial areas necessary to permit profitable production of this plant.

The CHAIRMAN. Do the farmers take any interest in it?

Dr. TAYLOR. I think not. A manufacturing concern did several years ago send an inquiry to New Zealand, as a result of which, without an order from them for the plants, a considerable shipment of plants was started. Those plants were found to carry some pests which caused their exclusion from the country.

Mr. LEE. Doctor, a few years ago, did not a very big corporation bring in a shipment of these plants?

Dr. TAYLOR. I think it was the International Harvester Co.

Mr. LEE. Yes; the International Harvester Co.

Dr. TAYLOR. That was the incident I had reference to.

Mr. LEE. That had nothing to do with your tests up to this time?

Dr. TAYLOR. No, sir.

The CHAIRMAN. Item 89, "For the investigation, testing, and improvement of plants yielding drugs, spices, poisons," etc., \$59,820.

Dr. TAYLOR. This includes an increase of \$1,000 to make adequate provision for the poisonous-plant investigations of the bureau. The Bureau of Plant Industry does the plant work connected with the live-stock plant-poisoning investigations of the Bureau of Animal Industry. We have one man engaged upon this work, which has been chiefly in the far West. There is need for field expenses through which that man's service can be utilized in certain portions of the year in the southern range country, where poisonous plant trouble has been reported. This \$1,000 is desired specifically for that work.

The CHAIRMAN. Are you conducting these investigations on public lands and in the national forests mostly?

Dr. TAYLOR. The forest lands and the public lands almost entirely, although occasionally identification work on privately owned ranges needs to be done to learn what plants are causing the trouble.

The CHAIRMAN. Do you attribute the loss of stock to any extent to these poisonous weeds?

Dr. TAYLOR. In certain cases heavy losses are experienced with larkspur and plants of that character.

The CHAIRMAN. You are asking for 32 positions for 1921, and in 1919 you had 58. You are asking for more money for fewer people. I am referring now to the table on page 81. You report 58 people employed in 1919, and you now propose to employ 32 people at practically the same expense.

Dr. TAYLOR. Those salary items, you will realize, include part-year employment; that is, part-time employment of men who during the remainder of the year are engaged upon some other line of work.

The CHAIRMAN. You report six on temporary employment in 1919 and one this year, so there is only a difference of five on temporary employment.

Mr. JONES. They may have been employed only for a short period of time. The whole 22 may not have worked more than four or five hours each.

Mr. CHAIRMAN. What is next?

Dr. TAYLOR. Page 82, item 90 "For crop technological investigations, including the study of plant-infesting nematodes." There is no increase in that. That work is proceeding.

The CHAIRMAN. Kindly tell us about these nematodes?

Dr. TAYLOR. That investigation is a very important activity.

Mr. JONES. Where is that?

Dr. TAYLOR. Item 90, on page 82.

These organisms, which are typified by the root-knot organism of the South, which affect many plants there, exist in very large numbers of species. There has not hitherto been careful systematic study of them anywhere in the world with respect to their injury to plants. One of them, to which I have made reference, which has come to light this last year, is the clover destroying nematode. Another is a sugar-beet destroying nematode, which is causing serious damage in several of the irrigated sugar-beet growing regions.

The work under this item is a careful, scientific, technical investigation of these organisms, to get at what they are, how many there are of them, what crops they attack, and to develop an adequate fund of information, regarding them in the expectation that with certainty trouble will come from them in the future. We believe it is wise to be forehanded with respect to these potential disease-producing organisms.

Mr. McLAUGHLIN of Michigan. As this work has been going on for years, are you finding new varieties of these things?

Dr. TAYLOR. Yes, sir. The effort at present is concentrated pretty largely on determining the life history of the organisms and getting at how they breed and function, and in that way to know what they are, how they live, and what the weak points in their life history are.

Mr. McLAUGHLIN of Michigan. Is the Bureau of Entomology doing anything in the same line?

Dr. TAYLOR. No, sir. Of course, in so far as human beings are concerned, the Public Health Service is working on the hookworm disease, which is caused by one of these same organisms.

Mr. JONES. I observe, Doctor, that this appropriation started in 1911 with \$13,000. The estimate now is \$24,940, and about 95 per cent of that is for salaries and traveling expenses. Why was it necessary to increase the number of men? Necessarily, it must have been the number of men that was increased to make these investigations in the last 10 years. Could they not have carried out these investigations with the original force?

Dr. TAYLOR. No, sir.

Mr. JONES. Why not?

Dr. TAYLOR. This should be borne in mind that the language of this item as it stands has not stood as it is here through this whole period of years. The work under this paragraph has varied and developed materially since the work was originally begun. The

work under this paragraph at the start was chiefly with respect to such technological investigations as the determination, for example, of methods of measuring the twist and the staple lengths of cotton. The nematode phase has grown in importance and in need especially during the last two or three years.

Mr. McLAUGHLIN of Michigan. Do you make some division there showing the amount spent for each kind of work?

Dr. TAYLOR. We will show that in our project statement, which the chairman has asked us to submit at the end of the hearings for the bureau.

Mr. McLAUGHLIN of Michigan. All right. You will show how much money you used for chasing these nematodes and how much for these other investigations.

Dr. TAYLOR. Our project statements will show that completely.

Mr. McLAUGHLIN of Michigan. All right.

The CHAIRMAN. What have you to say about item 91, "for biophysical investigations in connection with the various lines of work herein authorized"?

Dr. TAYLOR. That covers the biophysical features of crop work prosecuted in cooperation with several of the other offices of the bureau, including the dry land agriculture and the irrigation agriculture and the alkali-resistant plant breeding work, all of which are covered in separate paragraphs. This item covers the technical plant transpiration studies and the water requirement studies in connection with both the dry farming and the irrigation agriculture experimentation.

Mr. McLAUGHLIN of Michigan. Of course, if the chairman were asked for a technical explanation of this word "biophysical," he would be able to give that, but I think there are other members of the committee who perhaps might not be able to tell.

Dr. TAYLOR. Item 92, "for studying and testing commercial seeds," is the subappropriation for pure-seed investigation under which our seed laboratory is maintained, through which the Seed Importation Act is administered for the protection of the country against imported adulterated or low-germination field seeds. That is a work that is assuming very large importance now that the world's stock of such field seeds as clover, and to some extent alfalfa, is low, and the tendency is to push off onto this country those seeds of low quality which can not be sold at home in the European countries.

Mr. McLAUGHLIN of Michigan. There is authority, is there, to exclude the defective or impure seed?

Dr. TAYLOR. The import seed law, the act of August 24, 1912, gives the Secretary of Agriculture authority to forbid entry of field seeds containing in excess of certain percentages of adulterants and, as amended on August 11, 1916, to exclude seed below a certain percentage of germination. This applies to field seeds and not to vegetable seeds. It applies to what are commonly known as agricultural seeds.

Mr. McLAUGHLIN of Michigan. When an importation of seeds is offered, it seems to me there would be a good deal of trouble and expense involved in testing those seeds for germination. There must be a considerable lapse of time involved. How is that worked out?

Dr. TAYLOR. A very large portion of our foreign seeds come in through the port of New York. The customs officers at the port of

entry take samples of each invoice, turn them over to our representative; they are immediately examined microscopically to determine the purity and freedom from adulterants, and the germination test is started. The shipment must be held; it can not be legally entered until our report back to the customs officer approves the entry. In the event the seed contains impurities which can be removed by cleaning processes, the cleaning must be done. All this is handled while the seed is in bond.

Mr. McLAUGHLIN of Michigan. That work and the expense of it, I suppose, is borne by the importer?

Dr. TAYLOR. Yes, sir; the only expense to the Government is for the work and expense of our people in the making of the necessary tests.

Mr. McLAUGHLIN of Michigan. Where is this germinating done?

Dr. TAYLOR. That is done either in our laboratory in Washington or at such cooperative laboratories as we maintain in several of the States—one at Columbia, Mo.; one at Berkeley, Calif.; one at Corvallis, Oreg.—whichever is nearest to the port of entry. The bulk of it is done here, because this is the nearest laboratory to New York.

Mr. McLAUGHLIN of Michigan. Have you an artificial or scientific way of forcing germination, or do you have to let nature take its course and in that way cover a great deal of time?

Dr. TAYLOR. The initial germinating tests are made in what are known as germinating ovens generally, where temperature and humidity are under control. For any close cases, if there is a certain percentage of hard seeds which will only germinate slowly, duplicate tests are made in greenhouses and in various ways. It usually takes, except with very quick germinating seeds like crimson clover, two weeks; in some cases longer than that.

Mr. JACOWAY. Doctor, under this provision have you prohibited any dealers in seeds sending impure seeds in interstate shipments?

Dr. TAYLOR. We have no authority over the interstate movement of seeds.

Mr. McLAUGHLIN of Michigan. While you are going through this work of testing the seeds they are held in bond, are they?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. In the original port of entry?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. This work is done in your laboratories, I presume, where a great deal of other work is being done?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. You do not have to maintain laboratories specially for that work alone?

Dr. TAYLOR. Not separately; no. We use the same laboratories we use on general seed-testing work, which is proceeding on a large scale. Individual farmers send in for testing samples of seeds about which they are doubtful, of the germinability of which it is important for them to have determined.

Mr. McLAUGHLIN of Michigan. I suppose that is true of each of the laboratories you have named; you do not maintain a special laboratory for that?

Dr. TAYLOR. No, sir.

Mr. McLAUGHLIN of Michigan. At any one of those places in this particular work?

Dr. TAYLOR. No, sir. In addition to this feature, which is definitely regulatory, we carry on continuous testing of the important field crop seeds over which we have no regulatory control but which we do have authority to test and to publish the results of the tests, naming the dealers whose output is found adulterated.

Mr. McLAUGHLIN of Michigan. That is, to advise and assist?

Dr. TAYLOR. Through publicity we endeavor to restrain adulteration.

Mr. JACOWAY. Doctor, in the South, Johnson grass seed is about the greatest enemy to land you can put on it, and it is very similar to Sudan grass seed. Have you had any complaint of seed dealers sending Johnson grass seed to the South under the guise of Sudan grass seed?

Dr. TAYLOR. There were complaints some time ago. There were cases of that nature soon after the introduction of Sudan grass in a commercial way.

Mr. JACOWAY. Yes.

Dr. TAYLOR. And it was at that time not possible to distinguish Sudan grass seed from Johnson grass seed. Methods of distinguishing were worked out by one of the specialists in this laboratory which have made possible the separation of Johnson grass seed from Sudan grass seed. I would not say that that practice has ceased, but we are not aware that there is now serious trouble.

Mr. JACOWAY. They say they are afraid to order Sudan grass seed for fear they might be putting Johnson grass on the farms.

Dr. TAYLOR. Yes.

Mr. LEE. Was it not really more fear than reality?

Dr. TAYLOR. No; it was a definite possibility. In fact, it happened.

Mr. LEE. Did it? I never knew it.

Dr. TAYLOR. And the State of California, which had a very strict prohibition on the sale of Johnson grass seed, found it impossible to administer its law until this method of distinguishing between the two seeds was originated. The two grasses are closely related, the Johnson grass having a perennial root stock, while the Sudan grass is an annual. So it was difficult to separate them.

The CHAIRMAN. Is quackgrass being sold under the name of Sudan grass?

Dr. TAYLOR. No, sir; quackgrass seed can be so easily distinguished from seed of the Sudan type that there is no trouble about it. There is some trouble with the quackgrass in the seed of brome grass, which is a grass grown in the cold and dry country of the plains States.

The CHAIRMAN. The seed sent out by the Government is free from the fowl seed?

Dr. TAYLOR. Yes, sir; absolutely free from adulteration.

The CHAIRMAN. Have you had any complaint about the seed sent out by the Government containing fowl seed?

Dr. TAYLOR. No, sir.

The CHAIRMAN. What protection is given in that connection in the importation of seed?

Dr. TAYLOR. This is the protection.

The CHAIRMAN. It is often alleged that these objectionable seeds are imported?

Dr. TAYLOR. Yes, sir; when they cross our border they have to come in through this door, regardless of from what country they come.

The CHAIRMAN. A careful examination is made?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. One can feel safe against the importation of foul seeds with other seeds?

Dr. TAYLOR. Yes, sir; in so far as the agricultural or field crop seeds are concerned.

The CHAIRMAN. Are all tested and examined?

Dr. TAYLOR. Yes, sir.

Mr. JACOWAY. Doctor, have you made a list of the dishonest seed dealers and published that?

Dr. TAYLOR. We publish annually a list of the dealers from whom we have purchased samples that show adulteration. One of the important reasons for the increase that we ask here is for the purchase of those commercial samples of seeds.

Mr. CANDLER. When you buy more than you need, what do you do with the surplus?

Dr. TAYLOR. For example, if a lot of Kansas-grown alfalfa seed proves clean, in every way suitable and good seed, we use it in our field crops seed distribution. If it proves to be adulterated, we destroy it. We need \$12,900 additional for this work.

Item 93, page 84, "For the investigation and improvement of cereals and methods of cereal production, and the study of cereal diseases," is one of the largest and at this time most important sub-appropriations in the Bureau of Plant Industry. It covers the whole cereal activity—the breeding, the cultural-method work and the cereal-disease work. To get this before you in just as clear and brief shape as possible, I will ask Dr. Kellerman to discuss that, as he has been giving special attention to the administration of this.

The CHAIRMAN. Let us take up the items as they appear in the note here, Doctor?

STATEMENT OF DR. KARL F. KELLERMAN, ASSOCIATE CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

Dr. KELLERMAN. I think no comment is needed on the first paragraph, Mr. Chairman, regarding the transfers to the statutory roll.

The CHAIRMAN. The actual increase is \$85,000?

Dr. KELLERMAN. Yes, sir; the importance of the breeding work and that general type of work has been briefly indicated in the language here. The experience of the last few years has shown that serious losses occur in all of the big producing areas because of mixtures of varieties.

Much of this can be cured by the substitution of fewer carefully standardized lots of adapted varieties for the present rather than mixed lots of seed. Unfortunately, during the war the mixing of different kinds of seeds has been very great due to the shortage in seed supply and practically all of the gain made in the previous five years has been lost.

In addition to this, there are certain changes in methods of cultivation that should be tested, and the extent to which new

methods can be adopted should be determined. The practice of spreading straw, for example, to prevent winter killing seems a very desirable thing to do. That has, however, one dangerous limitation: Spreading straw will also increase losses from wheat scab unless the straw is entirely free from this disease. Therefore, that cultural practice is one that can not be advised generally. The result from straw spreading in the long run will probably be more dangerous than beneficial unless it can be combined with a method for checking wheat scab.

Mr. McLAUGHLIN of Michigan. Would there not be scab in the straw if scab was present in the wheat when it was growing at some stage; would it not be present in the wheat at some stage so as to be known?

Dr. KELLERMAN. Yes; if one knows what to look for. Wheat scab caused losses last year probably more serious than any other one disease in the Middle West. It is probable that this disease caused a loss of 36,000,000 bushels of wheat in 1919, and yet wheat scab is not very well recognized. The injury from scab is ordinarily ascribed to hot weather or some other unfortunate weather condition that may have come up. While weather conditions intensify injury by wheat scab, still the disease itself is the main cause of injury.

Mr. McLAUGHLIN of Michigan. What is it like? How is it noticed?

Dr. KELLERMAN. It blights the kernels. In moist weather when the scab is bad you will see a little pink fungus, that is, a little fuzzy pink growth like a very small mold growing around the edges of the glume of the grain—

Mr. McLAUGHLIN of Michigan. Right around the kernel?

Dr. KELLERMAN. Right around the kernel, and the grain of the wheat is shriveled. Enormous losses of wheat are caused by this disease, chiefly in the big winter wheat region.

Mr. McLAUGHLIN of Michigan. Wheat is often shriveled by the heat?

Dr. KELLERMAN. Yes. The same fungus that causes wheat scab is one of the most troublesome fungi that causes the seedling root rots of corn that are estimated to cause heavy losses also.

Alteration of wheat and corn production on the same field, therefore, exaggerates both the trouble from wheat scab when the wheat crop is growing and the corn root rot when the corn is growing. You get the continued increase of these dangerous fungi when that rotation is used.

At the present time, from our general estimates, we think something approaching a 2 per cent loss in the corn crop is caused each year by these root rots and ear rots, due to this wheat scab fungus. That would amount to 70,000,000 bushels of corn a year.

It is necessary for us to work out methods of culture that will make it possible to get on this land some crop that is not affected without interfering with the cash return to the farmer. That is one of the cultural problems that we must investigate.

The CHAIRMAN. Some crop to intervene between wheat and corn?

Dr. KELLERMAN. Yes.

The CHAIRMAN. That will remove the trouble?

Dr. KELLERMAN. It reduces the trouble. We can not kill out that fungus in one year. Wheat scab and corn rots are so widely

distributed that the most we can hope to do, for many years at least, is to reduce them and prevent the heavy losses that occur.

To come back again to the breeding problem. The breeding of disease-resistant varieties of cereals is one of the phases of disease control that offers a very material promise of success. So both the breeding of types of cereals better adapted to the different regions of the country, more hardy, and less subject to loss from shattering, and getting those varieties more clearly recognized and in pure lines, and the breeding of these different types of cereals with ability to resist the more destructive cereal diseases, are two important lines for the department to continue.

Mr. McLAUGHLIN of Nebraska. Doctor, out in the States west of the Missouri River, Nebraska and Kansas especially, this last spring and summer there were very excessive rains. It was exceedingly wet, and there was a heavy growth of wheat. The farmers calculated they were going to have the largest yield in the history of those States?

Dr. KELLERMAN. Yes, sir.

Mr. McLAUGHLIN of Nebraska. Then, two or three weeks before harvest it turned dry and hot, and one of the lightest yields was secured in some parts; some parts only 5 to 8 bushels of shriveled-up wheat. The farmers attributed that to the hot weather following the wet weather so quickly. Is it your thought that probably this fungus was the cause of that small yield?

Dr. KELLERMAN. In the western portion of Kansas and Nebraska I think the weather was the main factor, if not the only factor, in the shrunken wheat. The same explanation, however, was used to account for the shrunken wheat that reached clear beyond the Mississippi. When you get into eastern Kansas and continue into the more humid regions of wheat production, the losses from scab become much greater, and the appearance of the wheat is almost identical with that which was merely shrivelled by the heat—that is, after it is thrashed. The appearance in the field is really different.

Mr. JONES. Doctor, I notice in this table your estimate for 1919 was \$186,000 in round numbers and the appropriation for that year was \$441,000. Why that decided jump at that time?

Dr. KELLERMAN. The Senate increased it for the eradication of the common barberry.

Mr. JONES. Did you eradicate it?

Dr. KELLERMAN. That is one of the big campaigns now under way.

Mr. JONES. Why did they not go back to a more normal appropriation after that? You continued to increase in 1920, and now it is almost \$100,000 more than your estimate for 1921.

Dr. KELLERMAN. That is true; but, even so, I regret that next year it will be impossible, because of insufficient man power and finances, to carry on the work in as many States as we are carrying it on in this year. At this time we are conducting barberry eradication work in 13 States, representing the principal wheat-growing States of the country. It will be necessary to reduce our barberry eradication work to four or five States in the coming year in order to handle the work efficiently with the men and money at our command.

The barberry eradication work is a bigger problem than we had expected. It was undertaken at the direction of Congress, and we

had not extensive surveys of the area in which we were to work at the time the work was begun. We had supposed, and I think everybody in the country had supposed, that the common barberry existed only in the places where it had been planted or in near-by places where it might have escaped from cultivation in a small way. As our field men have carried on their inspections in all of the spring-wheat States first, and later in the adjacent States, we find that the number of barberries that have escaped from cultivation is literally enormous. Each barberry plant is a potential source of a black rust epidemic. These plants that have escaped from cultivation have been able to get along in many cases for many years under the protection of trees, in fence corners, or in other uncultivated places, and the task of a thorough inspection of the places where barberries can grow, and an inspection of the eradication work; that is, an inspection of the complete destruction of each barberry plant is a task many times greater than we had supposed it to be. It has seemed to us, therefore, that it would be best to concentrate our work this year to the spring-wheat area of the United States, which is the area that has always suffered more severely from the black rust epidemics.

The CHAIRMAN. Does it not affect the oat crop?

Dr. KELLERMAN. It is seriously destructive; yes.

The CHAIRMAN. Is it as destructive to oats as to wheat?

Dr. KELLERMAN. I think it is actually about the same, but it is not considered so seriously because you have not the continuous fields of oats that you have of wheat, and, therefore, an epidemic is not as liable to spread across an entire State as it is in a spring-wheat region.

The CHAIRMAN. Is any State free from black rust?

Dr. KELLERMAN. No, sir.

The CHAIRMAN. It is all over the country?

Dr. KELLERMAN. It is scattered all over the country.

The CHAIRMAN. Was it black rust that destroyed the wheat in this vicinity last year?

Dr. KELLERMAN. The damage in the eastern part of the country was mostly from scab.

The CHAIRMAN. They had the black rust?

Dr. KELLERMAN. They had some black rust. This year there was more damage in the East from leaf rust than from black rust, I believe.

The CHAIRMAN. What is the leaf rust?

Dr. KELLERMAN. It is just a different species of rust, Mr. Chairman. The leaf rust does not attack the stem of the grain.

The CHAIRMAN. Is that commonly called the red rust?

Dr. KELLERMAN. The red rust.

The CHAIRMAN. That is not as injurious as black rust?

Dr. KELLERMAN. That has not been generally considered injurious, Mr. Chairman, but the losses from leaf rust for the last two or three years have been increasing alarmingly. It is now regarded as one of the really serious troubles, but none of those troubles approach the excessive losses that occur from the black stem rust epidemics.

The CHAIRMAN. The red rust kills the leaf but does not kill the stem?

Dr. KELLERMAN. It does not kill the stem.

The CHAIRMAN. Some of the largest crops we have had were when we had red rust?

Dr. KELLERMAN. Yes.

The CHAIRMAN. We have never feared the red rust, but we knew when it ran to black rust we would have a light yield?

Dr. KELLERMAN. Sometimes you will get weather conditions when leaf rust will do serious damage to your plant before it produces its head. Then the head will be shriveled.

The CHAIRMAN. I visited a number of fields in Virginia last year which were killed by black rust.

Dr. KELLERMAN. Yes; it does cause severe loss, but it is not as serious in the East as the big spring-wheat areas.

The CHAIRMAN. Does it cover the whole country?

Dr. KELLERMAN. Yes.

The CHAIRMAN. Is any State free from it entirely?

Dr. KELLERMAN. No.

Mr. CANDLER. Do you think it advisable to continue this work at all and only remove it from these States and confine it to five or six States, or would it be better to go ahead and exterminate it in all of them as rapidly as possible?

Dr. KELLERMAN. I regret that the task is too big to try to do it all at once.

The CHAIRMAN. Is it not a fact that the spore is carried hundreds of miles?

Dr. KELLERMAN. They can be carried hundreds of miles in severe storms, but we have very little reason to believe they are often carried very far, because in our field examinations we find small black rust epidemics only when there are numerous barberry plants near by. If we get out in a region practically free from barberry plants—that is, if we can get several miles away from barberry plants—we have only a little black rust. It is for that reason that we have come to the conclusion that with the amount of money we have available for the coming year it will be better for us to clean up as completely as we can this spring wheat area that has suffered the heaviest losses in times gone by.

The CHAIRMAN. Yes; but the spores may be carried?

Dr. KELLERMAN. The spores may be carried.

The CHAIRMAN. Then it would not do much good to clean up in one locality unless you cleaned up the whole country. I have heard that they have been carried as far as 200 miles, and in some cases as far as 1,000 miles.

Dr. KELLERMAN. I think that is possible. I think it is also fair to say, if we can kill all the barberries in the spring wheat States, that the likelihood of a big epidemic sweeping across those States is small.

The CHAIRMAN. Are you satisfied that by exterminating the barberry you can eradicate the black rust?

Dr. KELLERMAN. I think we can prevent epidemics of black rust. I doubt whether we will ever eradicate entirely the disease in this country. In fact, I think it would be better to say it is impossible to eradicate black rust in the United States.

The CHAIRMAN. Is barberry the only source of black rust?

Dr. KELLERMAN. No; wild grasses will harbor it in the South, but will not spread it in cold regions unless it gets to the barberry.

The reason I am not urging barberry eradication in the warmer regions is that the stem rust will continue there anyhow.

The CHAIRMAN. It develops under certain climatic conditions?

Dr. KELLERMAN. Yes; in Missouri the weather is such that stem rust will live over the winter in the stage that will affect wheat, but in Minnesota it will not without the barberry.

The CHAIRMAN. Does the rosebush aid it?

Dr. KELLERMAN. Nothing but the barberry.

The CHAIRMAN. What are the weeds or grasses you referred to?

Dr. KELLERMAN. There are many wild grasses that will carry the summer spores, but only if the winter is not too cold.

The CHAIRMAN. You mean after they mature?

Dr. KELLERMAN. After they mature, will carry them so they will affect wheat the next year if the weather is not cold.

Mr. McLAUGHLIN of Michigan. The barberry bush is a shrub?

Mr. KELLERMAN. Yes, sir.

Mr. McLAUGHLIN of Michigan. An ornamental shrub?

Dr. KELLERMAN. Yes, sir.

Mr. McLAUGHLIN of Michigan. It is cultivated by people as an ornamental shrub, and the nurseries sell those things. Are the nurseries still selling them against your objection?

Dr. KELLERMAN. No, sir; the American Association of Nurserymen voluntarily, and I believe also unanimately, passed resolutions eliminating the common barberry from their ornamental line, and the western nurserymen, as far as I remember, without exception, have refused to sell the common barberry for distribution in any of those Western States.

The CHAIRMAN. A number of States prohibit it entirely by law?

Dr. KELLERMAN. Yes, sir; practically all of the Western States now.

The CHAIRMAN. And destroy them?

Dr. KELLERMAN. And require their destruction.

Mr. McLAUGHLIN of Michigan. Describe what one of your men does in inspecting this barberry business.

Dr. KELLERMAN. The barberry inspector, when he finds the barberry plant, first informs the owner that he has on his premises this plant or plants that spread the black rust in wheat. If the man does not understand anything about it, he makes it a point to explain the reasons. We request the immediate destruction of the plant that is, if it is practicable. If the owner is there on the property, so the whole thing can be done at once, the inspector remains while the plants are removed. In so far as he may do it, he helps take them out so as to make sure they are taken out properly, so that all the roots that might sprout again are thoroughly removed. That is one difficulty in our eradication work—to get the people to take out not only the central clump of roots but all the roots.

Mr. McLAUGHLIN of Michigan. Do you find the people object at all to removing the barberry bushes from their grounds?

Dr. KELLERMAN. Very few people object. A few people have objected. I think the few that have objected did so because they really did not understand why the campaign was being urged.

Mr. RUBEY. What do you do in the case of an objector?

DR. KELLERMAN. If a man refuses to take out his bushes the department has done nothing in those cases beyond referring the matter to the CHAIRMAN. How many States have enacted laws requiring their destruction?

DR. KELLERMAN. I believe there are six States. Minnesota and Wisconsin, I believe, have orders. I had included those as laws. They are really orders of their public-safety commissions. They have the force of law, however.

The CHAIRMAN. In Wisconsin the Federal or State inspector visits the place, as you say, and gives orders to destroy it. They visit the place again two weeks later and see that it is done.

DR. KELLERMAN. Yes, sir.

The CHAIRMAN. That is also true in my State, Iowa.

DR. KELLERMAN. Yes, sir.

The CHAIRMAN. And I think it is true in Minnesota.

MR. ANDERSON. I think the original order of the safety commission requires destruction of them, and, as Dr. Kellerman says, that has the force of law. I suppose, however, that that will be at an end before very long.

DR. KELLERMAN. I have rather expected that. We had hoped, when we started in on our first really large campaign, that we would have the barberries so nearly eradicated by this year that the question of permanent legislation would be less important to us.

The CHAIRMAN. Have you a list of the States that have enacted laws?

DR. KELLERMAN. I have not the list here.

The CHAIRMAN. Will you insert it in the record?

DR. KELLERMAN. Yes, sir.

(The statement referred to follows:)

STATES WHICH HAVE PASSED LAWS OR REGULATIONS REQUIRING BARBERRY ERADICATION.

When the campaign opened Colorado already had an amended plant-pest law which gave sufficient authority to eradicate barberries.

Illinois, Iowa, Michigan, and South Dakota have passed amendments effective in 1919, which either amend existing crop-pest or plant-inspection acts so that these laws will also apply to harmful barberries or define harmful barberries and provide for their eradication.

Minnesota, Montana, Nebraska, North Dakota, and Wisconsin have passed new laws which declare harmful barberries a nuisance and provide for their eradication. These laws have become effective in 1919.

In Indiana, under authority of the acts of 1919, the conservation commission issued an order on November 6, 1919, in force on and after the 29th of November, 1919, which declares *Berberis vulgaris* and all its horticultural varieties a menace to wheat and other small grains and orders its removal. This order is to all intents and purposes the same as a law.

In Ohio a new crop-pest law of August 15, 1919, gives the Secretary of Agriculture sufficient authority to enforce the eradication of barberries, but to date this law has not been invoked for that purpose. Recently under this act a quarantine was placed on the shipping and sale of barberries within the State.

To date in Wyoming the existing horticultural law has not been construed to cover the situation, nor has any new law or amendment been enacted.

The CHAIRMAN. The nurserymen are not selling the barberry bush. How long will those that have been grown live if not interfered with?

DR. KELLERMAN. It is a long-lived shrub. I do not know—I suppose you would have some 25 or 30 years old.

Dr. TAYLOR. There are shrubs in humid sections that are 60 and 75 years old, and there is in the Saginaw district of Michigan, where a nursery was—

Mr. McLAUGHLIN of Michigan. Is the damage as great in that Saginaw section as in other sections of the country?

Dr. TAYLOR. The damage is not nearly so great in winter wheat territory as in spring wheat territory.

Mr. McLAUGHLIN of Michigan. I know; but is it as great in that Saginaw district? Is it as extensive in the district where the barberry is noticeable as where it is not noticeable?

Dr. TAYLOR. There is practically no portion of Michigan that was out of sight of barberry hedges. Prior to two years ago barberry was one of the most common ornamentals; it was planted on almost every farmstead. In many cases it was used for roadside hedge planting. It was in my home country in southwestern Michigan, and likewise throughout all the older settled parts of the State.

There are numerous examples where wheat that was adjacent to these hedges and dooryard plantings has shown year after year a heavy early infection of black rust where a few miles away—this is mostly in the Wisconsin and the Minnesota country—that rust did not become epidemic early enough to shrink the wheat.

The CHAIRMAN. Is it not a fact that it is harmless under certain climatic conditions?

Dr. TAYLOR. The injury may be negligible.

The CHAIRMAN. We find in our section of the country, if the wheat matures before the hot winds and heavy dew come, that we have a big crop of wheat; but, if the heavy dew and high temperature both come before the maturing of the wheat, we have black rust. Sometimes 10 days before harvest, we expect a yield of 25 bushels, but the black rust will cut it down to 10 bushels and shrivels up the wheat. That has been our experience for 25 years. I was surprised that the people in this vicinity did not know about black rust. They were estimating 30 to 40 bushels last year. I estimated that they would get only 10 to 20 bushels, and it turned out that way. We have had it to contend with every year since 1870.

Dr. TAYLOR. If the disease develops sufficiently while the grain is in the milk, you can be sure of heavy shrinkage. If it does not develop until after the grain is well through the dough stage, you get little damage to the wheat.

The CHAIRMAN. It is very discouraging if you can not operate in more than four States. I am afraid that is not going to accomplish much; that is, if it is true that it is carried in the air for a distance of 200 miles.

Dr. KELLERMAN. There are two ways of looking at that, Mr. Chairman. One is the attempt to provide sufficient funds for a greatly increased activity; the other is to attempt to take the heart of the troubled district and clean that up thoroughly, and then to gradually expand that clean area. The first plan would require such heavy expenditures that it seemed to us unwise to recommend that at this time.

The CHAIRMAN. AS I understand, it is impossible to exterminate it in the southern climates?

Dr. KELLERMAN. To exterminate the black rust; yes, sir. To exterminate the barberry to a degree that will prevent serious epidemics

I believe to be entirely practicable. We believe it will be necessary to have barberries exterminated over a much larger area than the four or five spring wheat States, but those are the States that suffer the great losses and where the epidemics are most likely to assume excessive proportions. For that reason, we believe we should begin with them and clean out the common barberry. The Japanese barberry is entirely harmless.

The CHAIRMAN. We speak of wheat, although the rust is just as injurious to oats?

Dr. KELLERMAN. Yes; it is injurious, but we have not considered it as much from the standpoint of oats because, as I said before, you do not have the large areas of oats as you do of wheat. If we can eradicate the common barberry, we believe we will have the seriously destructive epidemics of black rust eliminated from this country entirely.

Mr. RUBEX. Does the barberry plant spread from roots or from seed?

Dr. KELLERMAN. Almost entirely from seed, but if it is chopped out the roots live and the larger roots will sprout.

Mr. LEE. Is it a little red berry?

Dr. KELLERMAN. Yes.

The CHAIRMAN. How many States are cooperating with you in this work?

Dr. KELLERMAN. We are now in actual cooperation with 13 States.

The CHAIRMAN. Can you give a list of the States?

Dr. KELLERMAN. Cooperation in the eradication of barberry is maintained with the States of Colorado, Illinois, Indiana, Iowa, Michigan, Minnesota, Montana, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin, and Wyoming.

The CHAIRMAN. You said you would have to reduce it to four States. What States are those?

Dr. KELLERMAN. The spring wheat States. We have not actually determined the limit. There will be approximately four or five States; maybe a few more. Those would probably be Wisconsin, Minnesota, North and South Dakota, and Montana.

Mr. McLAUGHLIN of Michigan. The barberry root is easily removed, is it not?

Dr. KELLERMAN. If it was not for its numbers it would be no problem whatever. It is only the remarkable distribution that the barberry has had in the last 25 or 30 years that makes the trouble.

Mr. McLAUGHLIN of Michigan. Can you not get the people to do it themselves?

Dr. KELLERMAN. At the beginning of this work we hoped that we could do it merely by calling attention to it through the newspapers, the country papers, and probably by posters and other publicity ways to call attention to the importance of getting rid of the barberries. We thought that not very much beyond the ordinary publicity work would be necessary. As the inspectors became more experienced in searching for barberries the plants were discovered in so many inaccessible places that we have become perfectly confident that the average person is not going to find the barberry bushes, and that it is going to require something of the same skill as a canker inspector employs to find a tree infected with citrus canker, or the potato specialist to find the late blight of potatoes.

The CHAIRMAN. Can not that be done through the county agents?
Dr. KELLERMAN. The county agents can not do all this work but will give us more help during the coming year.

Mr. McLAUGHLIN of Michigan. Why could they not do it?

Dr. KELLERMAN. In the first place, they would have to have trained men go out with them to show them where to search for barberries.

The CHAIRMAN. Does it require training to find the barberry bush?

Dr. KELLERMAN. It seems so.

The CHAIRMAN. If they can not do that, we had better dispense with their services. I think a blind man can pretty nearly do it.

Dr. KELLERMAN. It is not that they could not search for them, but a certain amount of experience in work of this sort makes it efficient and reasonably cheap. The average person hunting for barberries is going to waste a great deal of time in searching in places that might seem to him reasonable but which the trained inspector could pass at a glance. In the same way he will overlook places that the man who is familiar with the inspection would find.

The CHAIRMAN. You do not expect people to go into every nook and corner throughout the United States to find barberry bushes, do you?

Dr. KELLERMAN. We have to in the spring wheat States.

The CHAIRMAN. It will take you years to go over one State?

Dr. KELLERMAN. We believe we have out in the different States from 60 to 80 per cent of the barberries in that most important group of States; that is, the 8 or 10 States with North Dakota as the center.

Mr. CANDLER. Is there any difficulty in recognizing the bush at all?

Dr. KELLERMAN. The little seedlings most people overlook; they are so little, and they get into such unexpected places.

Mr. CANDLER. If they can recognize the bush, it seems to me that the suggestion made by the chairman that the county agent can look them up is a good one. It occurs to me that if he has eyes and is educated in the description of the bush, he can locate it.

Mr. JACOWAY. Would it not take the county agent all his time looking for this barberry bush, Doctor?

Dr. KELLERMAN. I do not think there is any doubt about it. If a man is going to hunt for barberries he will have no time for anything else. We have had men working desperately here this year in the field and men gaining experience every week that made them able to cover the ground more rapidly and more thoroughly; and yet with an unusually good organization, with a very high degree of interest on the part of the men who are doing the work, we certainly are finding the problem really difficult.

Mr. McLAUGHLIN of Michigan. I have been very much interested from the first in this inspection work, and I believe a good county agent is a very valuable institution in the county—

Dr. KELLERMAN. I think so.

Mr. McLAUGHLIN of Michigan. And he has a great deal of work to do, but I have been a little disappointed in the way the thing has worked out. It was surprising to some. It shocked some people when it was suggested that when this extension law matured

there would be money enough for the employment in each county of a man representing the Federal Government, paid partly by the Federal Government. They thought it was a wonderful thing to have one trained man in each county in the State, but we are hearing from time to time that a county agent can not do this and he can not do that. An expert must be sent to help him to do one thing and help him to do another. He is not capable of doing the things one would ordinarily think the county agent would be able to do. It is a disappointment to me to hear that the county agent can not do some of these things. You have to send an expert with him to advise as to the feeding of cattle, the breeding of cattle, the diseases of each kind of cattle, different kinds of fruit diseases, the diseases of different vegetables; you have to have a separate expert for each one of those things. The county agent is not capable of looking after any one of them.

Dr. KELLERMAN. I think you will find, Mr. McLaughlin, that the county agents, as a general average, look after all these things you have referred to, but every once in a while some unusually important problem or some unusually difficult problem comes up along one of those lines where the aid of a more highly trained specialist is necessary. Naturally those are the cases that come before you, and naturally those are the cases where it is necessary to ask for a specialist.

Mr. McLAUGHLIN of Michigan. A man from the Bureau of Animal Industry told us yesterday that it was necessary to have his specialist go out to assist in the organization of a bull association and to teach breeding methods. I do not know, but I am afraid we are carrying the expert business a little too far.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

Mr. JONES. I want to ask Dr. Taylor a few questions. Doctor, in the first place, will you tell me the difference, if there is any difference, between part time and temporary time among your employees?

Dr. TAYLOR. As those expressions are used here?

Mr. JONES. Yes.

Dr. TAYLOR. Part time means that the man is part of the year on this work and part of the year upon some other work for the Department of Agriculture. He is a continuing employee of the department, whose services are assigned part of the time to one line of activity and part of the time to another. "Temporary" signifies that he is employed for a part of the year only; as, for example, during the crop season.

Mr. JONES. Will you kindly turn to page 85 of the estimates. Under your column "Expended in 1919" the sum total of employees is given as 175. If I added that up correctly I find that you had about 55 temporary and part-time men; then there are 78 per-month and per-diem men; that makes 133, which would be temporary, part time per diem, and per month; that, taken from your sum total of 175 left 42 permanently on the roll?

Dr. TAYLOR. Yes, sir.

Mr. JONES. Now you propose in your estimate for 1920 to make that 90, with two men on part time; that would be 88 permanent men. You consider that a necessity, do you?

Dr. TAYLOR. That is our best judgment at this time; yes, sir.

Mr. JONES. That will be an increase of 100 permanent men on this appropriation?

Dr. TAYLOR. For the fiscal year 1920?

Mr. JONES. Yes.

Dr. TAYLOR. Yes.

Mr. JONES. You think that is a necessity?

Dr. TAYLOR. Yes; that is our best judgment.

Mr. JONES. To analyze it a little more, if you go up the line, you will find pathologists that get \$1,500 a year. You have in your estimate for 1920 seven—two part time. In 1919 you had only four part time on that. What is the necessity for that increase there?

Dr. TAYLOR. I can not give you that in detail and specifically with respect to this particular instance, but here is the situation—this may help you, Mr. Jones. You remember that in the fiscal year 1919, which ended last June, we were operating under rapidly changing conditions, with our men going into the Army and coming back again.

Mr. JONES. I understand why you have a lot of temporary men and a lot of part-time men, but my inquiry is this: You only had four men altogether for that particular position on part time. Now you propose to have seven permanent men and only two of them part time?

Dr. TAYLOR. Yes, sir.

Mr. JONES. There is certainly an increase in the duties to be performed, or you do not need the men.

Dr. TAYLOR. Under this enlarged work that is estimated for; yes, sir.

Mr. JONES. Then, further down, you have an assistant at \$1,500. You have seven, and last year you had only four temporary men?

Dr. TAYLOR. Yes, sir.

Mr. JONES. The large work demands that increase, does it?

Dr. TAYLOR. Yes, sir. Our appropriations for this work, and especially for the pathological features of this work, are very largely for men.

Mr. JONES. I observe that, and expert men, too.

Dr. TAYLOR. They must be. It can not be done except by trained men. So that I serve notice now that practically every time you increase an appropriation which covers new work you increase our personnel.

Mr. JONES. I understand that is true. I have been convinced in the last three or four days that that is true. But can you tell me why—I presume you can—if there is a bug on wheat—

Dr. TAYLOR (interposing). That would come under the Bureau of Entomology, but suppose it were a case of disease of wheat or a disease of potatoes; there is exactly the same need for special training, ability, and experience with plant diseases as there is with human diseases. There are no efficient general practitioners on plant diseases at this time.

Mr. JONES. Yet all these men who have been working part time have evidently been going into some other branch of your department; they have some efficiency in other lines?

Dr. TAYLOR. I do not mean to say they are not efficient, because they are. There are particular features of this work which they can be assigned to, but the real way to get at it would be to have a session over in our laboratories. I wish we could do that.

STATEMENT OF DR. KARL F. KELLERMAN, ASSOCIATE CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. I would like more information about black rust. What progress has been made, what do you expect to do, and what may we look for?

Dr. KELLERMAN. I think I can put the case very briefly, Mr. Chairman, in this way: Our field experience for the past two years bears out very strikingly the statements of the men in Denmark and Sweden that the elimination of the barberry resulted in the suppression of the black-rust epidemics.

The CHAIRMAN. Do you concur in that conclusion?

Dr. KELLERMAN. We concur in that conclusion.

The CHAIRMAN. The next thing is to exterminate it. How are you going to do it?

Dr. KELLERMAN. The plan of exterminating the barberry by publicity methods does not appear to us to have any hope of success. We have very effective methods of calling attention one way and another to the danger of the barberry plant, but unless unusual emphasis is given to the discovery of these stunted little seedlings, that are just about as dangerous as the big bushes when it comes to spreading rust, but which are very easily overlooked—unless we give a specially hard drive to the eradication of those, we fear the whole thing will fail.

The CHAIRMAN. You now have men and women lecturing in nearly every town and hamlet in the country. Can you not cooperate with that branch of the department, disseminate this knowledge, and get some enthusiasm in the work?

Dr. KELLERMAN. We are doing it now.

The CHAIRMAN. I understood you to say that the county agents would not be of service?

Dr. KELLERMAN. I certainly did not want to create the impression that the county agents could not help us. The county agents are helping us in every possible way. They are calling attention to the barberries whenever they see them; they are calling attention to our different pamphlets, and they are helping us distribute our pamphlets; they are calling attention to articles that are in the country papers on barberry; in every way they can they are supplementing our work on the campaign of eradication. What I meant to say was that the county agent is even now overworked.

The CHAIRMAN. In my opinion, this is the about most important work you have. You can render as valuable service to the country in this one way as in anything we have before us.

Dr. KELLERMAN. We believe it is very important.

The CHAIRMAN. It seems to me these county agents should be directed on this line, because it is a most important line of work. In my opinion, you can develop the yield of wheat by exterminating

the black rust. Very little has been done. I do not know how much the department has done. In my State and also in Wisconsin and Minnesota, the States did some good work.

Dr. KELLERMAN. Yes, sir.

The CHAIRMAN. It does not do the country much good to eliminate the black rust in Iowa, Wisconsin, and Minnesota unless you eliminate it all over the country. For that reason Federal money was appropriated with the hope of accomplishing something. If the rust spores can be carried 200 miles in the air, however, it will not do much good to have the disease exterminated in Iowa and later carried into Iowa from Illinois, or some other State. It seems to me that, with the number of agents, experts, and others traveling over the country, there ought to be some way of carrying this information to the people and getting them interested in the work. It will not take very long, at least, to try it out. You should concentrate every effort on this particular thing, because it is of so much importance. All the work, of course, is important, but some features are more important than others, and I think this is about the most important work you have.

Dr. KELLERMAN. We regard it as very important, Mr. Chairman, but it is more a question of what can be done in the most effective way. If we take the area that suffers the most severe losses and clear it up first we believe we will be making very effective progress. The other way, as I said a moment ago, was to try to clean up the entire country. To clean up the entire country is such an enormous undertaking, and the interest in that kind of clean-up is so slight in the southern and eastern sections that at this time we could not get the enthusiastic support of the entire public that we get in the West.

The CHAIRMAN. This morning we were discussing the citrus canker. Suppose you had confined your interest to Florida and let the rest of the country go, you would have accomplished little. If you are going to handle this properly, you must handle the whole country in order to accomplish anything. If you can devise some plan whereby you can do some effective work, very well, but I am afraid this piecemeal proposition will result in simply throwing away money.

Dr. KELLERMAN. We do not feel that there is any waste of money. We do not propose, Mr. Chairman, to stop with cleaning up the spring-wheat area.

The CHAIRMAN. But if the spores are in Missouri it is of little use to clean it out in Iowa, because the spores are driven over from Missouri into Iowa and cause just as serious damage as though the rust had originated in our own State.

Dr. KELLERMAN. That is possible but, as we say, our field experiences in the last three years has indicated that the black-rust epidemics are, after all, rather closely confined to the places where we find the common barberry. We find, as we get a few miles away from areas where barberries are growing, that black-rust infections get quite light; while they are not absent, still they are not severe.

The CHAIRMAN. I will give you an instance: In my own State a year ago we raised 20 or 25 bushels of oats to the acre. We had favorable weather conditions, no heavy dews, but dry and cool weather. Wheat went 20 to 25 bushels to the acre. This year we had the dew and the hot weather a few days before the wheat matured, and about 8 or 9 bushels was all it went to the acre.

Mr. LEE. Was that due to the black rust?

The CHAIRMAN. That was due to the black rust; yes.

Mr. LEE. We had the same experience, but without any black rust.

The CHAIRMAN. You have black rust. Every State in the Union has black rust. They tell us that they have not the black rust in Virginia, but I went out in the fields in Virginia and examined them last summer. They are now beginning to believe they have the black rust. The doctor that is here agrees with me. It takes years before it is discovered. We discovered it in Iowa in 1878.

Dr. KELLERMAN. Undoubtedly stem rust is one of the reasons why winter wheat is grown in many different places where spring wheat is not profitable.

The CHAIRMAN. I wish you would give further consideration to this and see if you can not work out some plan.

What about this corn item, that "\$40,000 shall be set aside for the study of corn improvement and methods of corn production"?

Dr. KELLERMAN. That is merely the continuation of our existing work.

The CHAIRMAN. What are you doing now, and what do you expect to do with the money next year?

Dr. KELLERMAN. That represents the continuation of the present work of breeding for better types of corn, more productive corn, and also certain experimental investigations of certain kinds of corn culture.

The CHAIRMAN. How is that conducted?

Dr. KELLERMAN. Almost entirely in cooperation with corn planters in different parts of the country. We are cooperating with the corn farmers, taking the different varieties of corn, and growing them under the direction of our corn experts.

The CHAIRMAN. By the farmers themselves?

Dr. KELLERMAN. By the farmers themselves.

The CHAIRMAN. You might describe what arrangements are made with the farmers?

Dr. KELLERMAN. These are merely informal contracts with the farmers by which they agree to handle the work under the direction of our corn experts, and a certain portion of that corn is available for the department's use.

The CHAIRMAN. The farmer enters into a contract to plant so many acres? How many acres?

Dr. KELLERMAN. I think most of those are in about 4-acre lots. Do you remember, Dr. Taylor?

Dr. TAYLOR. They range from an acre to 10 acres, depending on the number of crosses and selections that are to be tested.

The CHAIRMAN. Trying out the various types of corn?

Dr. TAYLOR. Breeding and field testing; the types in the North, for instance, for early maturity, as in Wisconsin, New York, and Massachusetts; in the farther South, for large yield and for insect resistance; that is, weevil resistance. Those are examples merely.

The CHAIRMAN. Are there any other items that you care to refer to? If not, we will go over to item 94, on page 88, "To enable the Secretary of Agriculture to meet the emergency caused by the existence in the United States of flag smut of wheat, take-all," and so forth, \$50,000.

Dr. TAYLOR. There is no change in that.

The CHAIRMAN. You might state briefly what you are doing, what you expect to do, what results have been obtained, and what may be expected.

Dr. KELLERMAN. You are probably familiar with the unexpected discovery of these two diseases, take-all and flag smut. Take-all is the Australian name, coming from the fact that under the Australian conditions it sometimes takes all the wheat in the field.

Mr. RUBEY. It covers a good big territory?

Dr. KELLERMAN. The losses ordinarily are not so severe as the name would indicate, although it is regarded as a serious disease in Australia. It is a soil-infesting disease.

The flag smut is also an Australian disease, and is probably more serious in its effect on yield, or probably would be more serious in this country. The areas found infested in southern Illinois were quarantined at the suggestion of the department. The department has taken no quarantine action, but the States of Indiana and Illinois have taken very effective action in preventing the movement of any grain or straw out of any area showing the disease. Our specialists have cooperated in that in locating the diseased areas and making sure of the identification.

The CHAIRMAN. Are these surveys made by the State authorities or under the supervision of the State authorities?

Dr. KELLERMAN. The surveys were made by our own men only, for at that time only our department men were familiar with these diseases.

The CHAIRMAN. The language in the act was somewhat different from what appears here. It states here "to be used in cooperation with the Plant Disease Survey, investigation, and control authorities of the several States."

Dr. KELLERMAN. That work has been in cooperation in all cases with the men in the different States, although the work of identification and the preliminary work of the surveys was handled entirely by our own people.

The CHAIRMAN. It is under your control and supervision?

Dr. KELLERMAN. It is under our supervision.

The CHAIRMAN. You arrange whatever cooperation is to be had?

Dr. KELLERMAN. Yes.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

Mr. RUBEY. I would like to ask a question about item 95, page 88, "for the investigation and improvement of tobacco and the methods of tobacco production and handling." Do you receive many inquiries as to how to handle tobacco after it has been raised—to prepare it for use, and so on?

Dr. TAYLOR. For curing it on the farm?

Mr. RUBEY. Yes, sir.

Dr. TAYLOR. Yes; particularly in territory where tobacco growing is new.

Mr. RUBEY. I have a friend at home who is a great user of tobacco. He smokes incessantly. This year he concluded he would raise his

own tobacco. I sent him some seed and he raised the tobacco. I believe it was last year. After it had matured he and his son sat down to smoke it and it pretty nearly took them out of the top of the house. He wrote to the Department of Agriculture for some method by which the tobacco could be made mild and pleasant to smoke. He received a letter, he said, from the Department of Agriculture which told him to take the tobacco and dampen it, put it in boxes, and put it down in the cellar or some place and let it stay there for two years. Now, when he got to the two-year proposition, as he was about 70 years of age, he said he would stop, because he knew he would be dead before the tobacco got so he could use it.

Mr. LEE. He got the wrong kind of seed.

Mr. RUBEY. I wondered if that came from your department, and if that was the only way to make tobacco mild and pleasant to smoke.

Dr. TAYLOR. He may not have grown the wrong kind, but he may not have handled it right during the curing process after the harvest.

Mr. RUBEY. There are some things that we used to hear about which got better with age, and I wondered if that was true of tobacco.

Dr. TAYLOR. I understand that it is necessary for the production of fine qualities of tobacco to age it; that there has been not short cut developed for effective curing.

Mr. RUBEY. That was all I wanted to ask about it.

The CHAIRMAN. How about item 96, "for the breeding and physiological study of alkali-resistant and drought-resistant crops?"

Dr. TAYLOR. There is no change in that, Mr. Chairman. That is our work covering the breeding and development of crops that will endure alkali and drought to a greater or less extent.

The CHAIRMAN. What have you done?

Dr. TAYLOR. Out of this has come, and there is still in progress, the development of the Egyptian cotton industry in the Southwest which roots back into this item.

The CHAIRMAN. What do you select to be planted on the alkaline land in the North?

Dr. TAYLOR. On strongly alkaline land, I do not know of any crop; some of the sorghums as forage crops, where the land is not too alkaline, come through.

The CHAIRMAN. How about timothy, clover, grass, corn, and oats?

Dr. TAYLOR. Clover, not. Timothy, I think, is rather more effective than clover. On strong alkaline land we have no crop—no economical crop—which can be recommended for planting. The correction there must come primarily through soil treatment where that is possible. Sometimes it is accomplished through drainage and the washing out of the alkali accumulation in the soil with the drainage water.

The CHAIRMAN. Do you know of any other treatment than draining or washing it out?

Dr. TAYLOR. No, sir; not a practical treatment.

Mr. LEE. If you have that kind of soil, you must sell it and move South.

The CHAIRMAN. What do you expect to do with this appropriation?

Dr. TAYLOR. We have made very definite and distinct headway. We were prepared to furnish for the airplane service that long-staple

fiber for its planes, which would have been required had the war continued this year. That supply grew out of this item, in the form of long-staple cotton, which was suitable for the manufacture of airplane fabrics similar to those made from Sea Island cotton.

The CHAIRMAN. That grows on alkaline land?

Dr. TAYLOR. On mildly alkaline soils.

Mr. LEE. Is that Arizona?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. That is the result of your investigations?

Dr. TAYLOR. Yes; the Egyptian-cotton industry of this country, which we are continuing to improve and work upon, rests primarily on these investigations.

Mr. CANDLER. Where is that especially grown?

Dr. TAYLOR. In the Salt River Valley of Arizona, the irrigated territory; and the arid Southwest and West is this year showing a capacity to produce that same type of cotton in good yields and with fine staple.

Mr. CANDLER. That crop has increased quite rapidly in that section, has it not?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. The department was conducting some experiments in Salt Lake a number of years ago. Is anything being done there now?

Dr. TAYLOR. I think that was a reclamation project.

The CHAIRMAN. I think so.

Dr. TAYLOR. We are not connected with that.

The CHAIRMAN. You are confining yourselves to cotton? That is the only plant you are working with?

Dr. TAYLOR. We are working with quite a large range of crop plants.

The CHAIRMAN. Item 97, page 90, "for sugar-plant investigations, including studies of diseases and the improvement of the beet and beet seed."

Dr. TAYLOR. That includes the study of diseases of both beet and cane, the encouragement of sugar-beet seed production, and investigation and encouragement of the production of cane and sorghum sirup. No increase is recommended in this item.

The CHAIRMAN. What is this money being used for?

Dr. TAYLOR. That work is proceeding in the West, where you may recall the country faced a serious emergency when our foreign supply of sugar-beet seed, upon which we had relied prior to the war, was cut off.

The CHAIRMAN. What progress has been made in that?

Dr. TAYLOR. Very encouraging progress has been made. This year we produced, according to my recollection, about one-third of our national requirements, where before the war we produced none.

The CHAIRMAN. You mean the country as a whole?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. Is the department doing that?

Dr. TAYLOR. In the experimental studies, determining the methods.

The CHAIRMAN. Out in the stations?

Dr. TAYLOR. In cooperation with the men in commercial production—

The CHAIRMAN. With the State stations?

Dr. TAYLOR. Both the State station and the large sugar companies which are endeavoring to protect their supply.

The situation with regard to the production of cane sirup is perhaps illustrated by the samples which are here, to which Mr. Lee calls attention.

The CHAIRMAN. What progress are you making in that?

Dr. TAYLOR. Very definite progress has been made in securing, introducing, and testing varieties of cane, specifically for sirup (in distinction from sugar) production. The work which was partly conducted by this bureau and partly by the Bureau of Chemistry under a similar provision has resulted, I think, in a very distinct improvement in the method of manufacturing the sirup.

The CHAIRMAN. You have nothing to do with the manufacture?

Dr. TAYLOR. No; except to the extent of determining how the newer varieties will work out and so of determining their value for sirup production.

The CHAIRMAN. What is the balance of the money used for?

Dr. TAYLOR. The largest item there is this \$12,500 for experimentation upon cane and sorghum sirup production, which has been done chiefly in Arkansas and Tennessee.

The CHAIRMAN. You set aside \$10,000 for sugar-beet seed work and \$12,500 for sirup, or \$22,500. Deducting that from the \$94,115, what do you do with the \$71,615?

Dr. TAYLOR. The large items there and the pressing ones are those covering the sugar-beet nematode disease of the irrigated West during the last year, and the mosaic disease of cane, which you will perhaps recall was brought to our attention from Porto Rico during the war. That item was inserted in the bill for stimulating agriculture to meet that emergency. The disease in Porto Rico was found to be much more widespread than had been supposed. It has proved destructive there in the portions that are infected, and I regret to say that in July last this same disease was found to be present and to have been present for several years in the Louisiana cane fields, and it has been located in several of the cane-growing States.

The CHAIRMAN. How much are you spending for the sugar-beet nematode work and how much for the sugar-cane disease?

Dr. TAYLOR. Most of the work in the mosaic disease of cane is covered by the \$20,000 which was carried over from the stimulating agriculture bill into this bill last year.

The CHAIRMAN. How about the remaining \$41,000?

Dr. TAYLOR. The sugar-beet nematode work, which cost \$10,000, was carried over also from the stimulating agriculture bill.

The CHAIRMAN. But I have reference to the \$94,000, after deducting \$10,000 and \$12,500, what is being done with the \$71,000?

Dr. TAYLOR. I have just accounted for \$30,000 of it. The remainder is used on the projects which are devoted to the investigation of such diseases of sugar beets as curly top, which is very troublesome in the West, and the study of the relation of the beet crop to the other crops that must be grown in rotation with it to make a sable sugar-beet production.

Mr. Chairman, I hardly know how to discuss the situation with regard to this particular item, for it has become clear since these

estimates were submitted that there will not be enough money here to carry forward the nematode work as vigorously as it ought to be, and it is doubtful whether there is enough to carry forward the mosaic disease of cane work as it should be to protect the national industry in the South this year.

The CHAIRMAN. You say it is very important?

Dr. TAYLOR. Yes, sir.

Mr. LEE. Mr. Chairman, before we leave this item, I want to say that Judge Park, of Georgia, sent this sirup to the committee for the committee to see.

The CHAIRMAN. This is a result of the investigation?

Dr. TAYLOR. One result. There are several factories.

Mr. CANDLER. The judge has been kind enough to furnish each of us with a sample.

The CHAIRMAN. I am sure the committee very much appreciates Judge Park's sending the sirup.

Mr. LEE. I just wanted to say that Judge Park, of Georgia, sent it; that is all.

Dr. TAYLOR. Item 98, on page 92, "For investigations in economic and systematic botany." There is no change in that.

Item 99, on page 92, "For the investigation and improvement of methods of crop production under subhumid, semiarid, or dry-land conditions." This is for dry-land agricultural work. We estimate an increase of \$10,000 here, primarily to meet the increased expenses of field operations in this work. Wages, costs of equipment, and transportation charges have increased, and some repair of buildings is needed, as well as the erection of an additional storage building at the Mandan field station, particularly to house the farm implements there.

We are asking for the restoration of the proviso formerly carried in this item:

That the limitations in this act as to the cost of farm buildings shall not apply to this paragraph.

The particular building involved is an implement storage building which will be needed at Mandan, the estimated cost of which, as near as we can approximate it on the basis of present conditions, will be about \$2,500.

The CHAIRMAN. Where is that building to be located?

Dr. TAYLOR. At Mandan.

The CHAIRMAN. What other buildings are contemplated?

Dr. TAYLOR. That is the only building we have in mind, but we have this to remember, that this subappropriation covers all the dry-farming field stations where there are buildings which could not be duplicated, if fire occurred, for less than \$3,000 or \$4,000, or, in some cases, \$5,000.

The CHAIRMAN. Doctor, we had this matter up when the last appropriation bill was under consideration. It seems that it was the general sentiment that we should not remove the limitations. It might be feasible to do it in certain instances. If you will specify just what is desired, and it is feasible, that might be provided for, but I judge from the action taken last spring that Congress would be opposed to removing these limitations entirely.

Mr. LEE. You mean to specify the exact amount?

The CHAIRMAN. I believe we had this up to \$1,500 last spring, and it was stricken out.

Dr. TAYLOR. No; the \$1,500 limitation now applies to us. That is the limitation under which we are working.

The CHAIRMAN. We raised it to \$1,500 from what amount?

Dr. TAYLOR. That has stood at \$1,500 for many years.

Mr. CANDLER. There was some specific item.

Dr. TAYLOR. Yes; in connection with the cotton station at Greenville, Tex. That was raised to \$2,500, I think.

The CHAIRMAN. You are contemplating just one building.

Dr. TAYLOR. That is all we have in mind or that could be carried through with the increase we are asking.

The CHAIRMAN. What about this \$10,000 increase?

Dr. TAYLOR. That is to cover this building and the increased costs of carrying on these field operations, due to the increased cost of labor, of equipment, of transportation—those are the principal items.

The CHAIRMAN. We will take up item 100.

Dr. TAYLOR. Item 100, on page 94, "for investigations in connection with western irrigation agriculture," is the experimental work upon the Government reclamation projects. We need an increase of \$10,000 for the same reasons as stated under item 99, except that there is no building involved in this case. It is a conservative estimate of the increased cost of carrying on the same amount of work that we have been doing.

The CHAIRMAN. These are investigations in connection with farming under irrigation?

Dr. TAYLOR. Yes; on the Government reclamation projects; that is, the solution of the specific problems which confront the settlers upon these Government projects.

The CHAIRMAN. We have been at this a long time. We started in 1911.

Dr. TAYLOR. Yes, sir; this work, as you may recall, was originally requested by the Secretary of the Interior, for the Reclamation Service, to provide a basis for the development of agriculture on those projects, the farmers there being debtors to the Federal Government for the costs of providing water for the lands.

The CHAIRMAN. Do you experiment to determine what plants do the best?

Dr. TAYLOR. Yes, sir; what crops to grow, what methods of culture and rotation to practice, and what methods of irrigation to follow. And this brings to my mind a case in which we are experimenting in the control of alkali in the soils on one of these projects by the drainage method. This work is the special agricultural experimentation on the Government reclamation projects which is not covered and provided for by the States.

Mr. CANDLER. It is entirely within the lands of the Reclamation Service, controlled by the Government itself?

Dr. TAYLOR. Yes, sir.

Mr. CANDLER. And it is for the purpose of aiding the settlers who have gone out there to take hold of these projects on the Government Reclamation Service?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. Doctor, the sentiment is quite general that we should reduce expenditures rather than increase them. I think it

will be necessary to make a number of cuts in the estimates; we will have to find some place where we can cut down. Is it not possible, as this work has been going on all these years, to cut this appropriation somewhat?

Dr. TAYLOR. I would not know where to suggest a cut.

The CHAIRMAN. We want to take care of all the important and necessary work.

Dr. TAYLOR. I do not know where to suggest a cut in these estimates, Mr. Chairman, that would not do serious harm, for we have already been through the operating room with respect to these estimates.

The CHAIRMAN. But the fact is that your operating room, through which you have passed, added about three and a half million dollars, whereas another department of the Government directs that appropriations be cut. I believe that sentiment is quite general. You, of course, appreciate the condition of the Treasury and the demands upon it, and I believe, if possible, we should cut appropriations as much as possible. I think we all agree, however, that we should be liberal with this one department.

Dr. TAYLOR. We have endeavored to hold these estimates definitely to an investment basis, that is, a wise investment of public funds in productive activity.

The CHAIRMAN. It has occurred to me that in an item like this, where we have been appropriating on an average of \$72,000 a year for 10 years, might possibly stand a little cut.

Dr. TAYLOR. I would not know where to suggest it in this item, sir, without damaging impairment of the work.

The CHAIRMAN. Let us take up item 101, page 95, "for the investigation, improvement, encouragement, and determination of the adaptability to different soils and climatic conditions of pecans, almonds," etc.

Dr. TAYLOR. This is an item which in this form is new this year. This is the first year of operation under it. It enlarged the work of the improving of the pecan and various other problems affecting pecans in the South, for which the department previously had been expending about \$9,000 a year.

The CHAIRMAN. How are you getting along with pecans, almonds, walnuts, and other nuts?

Dr. TAYLOR. In the case of pecans very distinct progress has been made. With the others the work is just beginning.

The CHAIRMAN. Practically all the money is expended for the investigation of pecans?

Dr. TAYLOR. No, sir; about \$11,000 out of the \$20,000 is allotted this year for the pecan work.

The CHAIRMAN. Your method is successful as far as pecans is concerned?

Dr. TAYLOR. Very gratifying progress has been made.

The CHAIRMAN. How about the other nuts?

Dr. TAYLOR. With the others the work is just beginning.

Mr. CANDLER. What is the character of the work?

Dr. TAYLOR. One of the serious problems being attacked is the question of the failure of the almonds of the Pacific coast to set their crop after the blossoms are fallen. It is a question of cross-fertilization of

the blossoms through the interplanting of suitable varieties to fertilize each other. Some of the almonds apparently are self-sterile in their flowers, requiring the pollen from flowers of other varieties blooming at the same time in order to set crops, if the weather conditions at the blooming time are at all unfavorable.

Mr. CANDLER. Is this work being done in the West?

Dr. TAYLOR. The almond work is in the West.

Mr. CANDLER. Where is the pecan work?

Dr. TAYLOR. In the South, principally in Georgia, to some extent in Florida and Mississippi, and certain extensions of that work are carried on in Louisiana and Texas.

Mr. CANDLER. That is the extreme southern part of Mississippi?

Dr. TAYLOR. Yes, sir.

Mr. CANDLER. Where they are raising this paper-shell pecan.

Dr. TAYLOR. Yes.

AFTERNOON SESSION.

SATURDAY, DECEMBER 13, 1919.

Mr. LEE. Mr. Tucker, of the California Almond Growers' Exchange; Mr. Linton, of Saginaw, Mich., president of the Northern Nut Growers' Association; Dr. Robert T. Morris, of New York, of the Northern Nut Growers' Association; and Mr. Joe Patterson, of Georgia, of the National Nut Growers' Association, would like to be given a short hearing next Tuesday afternoon, if possible, not to exceed an hour or 45 minutes.

Mr. McLAUGHLIN of Michigan. If they are in town they could be heard.

Mr. LEE. Mr. Patterson is the only one that is here. I take it that you know this other gentleman, Mr. Linton, Mr. McLaughlin?

Mr. McLAUGHLIN of Michigan. Yes.

The CHAIRMAN. How much time will they require?

Mr. LEE. I think one hour will be sufficient.

Mr. McLAUGHLIN of Michigan. Could they wait until a later day just as well, for this reason: The sugar bill has just come over from the Senate and is before this committee now, and it should be taken up as soon as possible. Of course, that is under the control of the chairman.

The CHAIRMAN. I want the committee to decide. I understand that the sugar bill must be given attention before we adjourn.

Mr. LEE. I would like to accommodate these gentlemen on Tuesday afternoon.

The CHAIRMAN. Of course, they are in town and want to be heard.

Mr. LEE. One of the gentlemen is from California and wants to go home during the holidays and will, of course, have to start soon after next Tuesday.

The CHAIRMAN. Can you [addressing Mr. Patterson] be here at 9 o'clock Tuesday morning?

Mr. PATTERSON. Yes, sir.

The CHAIRMAN. Without objection, we will hear you on Tuesday morning at 9 o'clock.

Mr. PATTERSON. Thank you very much.

(The statements of Tuesday, December 16, in reference to this item are inserted at this point.)

Tuesday, December 16, 1919.

The committee met at 9 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. The committee has met this morning to consider an appropriation for the nut industry. Mr. Patterson, if you wish, you may control the time and present the witnesses.

STATEMENT OF MR. J. M. PATTERSON, OF PUTNEY, GA., REPRESENTING THE NATIONAL NUT GROWERS' ASSOCIATION.

MR. PATTERSON. Mr. Chairman and gentlemen, the ordinary man thinks of a nut as associated with his excursions in the fall into the woods to pick a few hickory nuts, and I imagine there are comparatively few people in the United States who think of the nut as a commercial industry, but it has arrived at that stage today. The chief commercial nuts are the almond, the Persian walnut, and the pecan. These industries are represented in an organized way by the Northern Nut Growers' Association, the Western Walnut Growers' Association, the Almond Growers' Exchange, and the California Walnut Growers' Association, and the National Nut Growers' Association, which represents the pecan.

There are various matters which we would like to bring out briefly, and I would like first to introduce to this committee Dr. Robert T. Morris, of New York, who is familiar to you as a surgeon, and whose interest in nut culture is not commercial, but purely scientific. I am going to ask Dr. Morris to tell this committee what he thinks of nuts as food, and to discuss any other phases of the question he desires to discuss.

The CHAIRMAN. Thank you, Mr. Patterson. We will be glad to hear Dr. Morris.

STATEMENT OF DR. ROBERT T. MORRIS, OF NEW YORK CITY, N. Y.

DR. MORRIS. Mr. Chairman, my interest is wholly scientific. I have no commercial interest whatsoever, and I have personally expended several thousand dollars in work of the sort that should be done by the Government, and a good many other men are doing the same thing in making investigations into nut culture. There are men who come to me to ask me to use my influence with the Rockefeller fund, the men in charge of it, and the Carnegie fund, for appropriations for investigations into nut culture. This is the coming agriculture. The reason for that is because a tree will stand for 100 years without exhausting the soil. It requires very little labor for collecting the crops, and it will produce to the acre more nitrogen, oil, and starch than any other crop. In some parts of the world the nuts form the staple diet for six months of the year. In some parts of Europe the chestnuts form the principal diet and also in the mountainous districts of China; in fact, in a large part of the mountainous districts of Europe and Asia nuts form a staple food crop. They take the place of the potato.

We have not felt the need in this country because we had labor enough, and we could turn over our lands and raise our annual crops

without great expense. The time has now come when we have got to raise to the acre more protein, more fat, and more starch than can be raised with the labor at our disposal, and I happened to bring along with me a book which gives some statistics, very briefly, and I can read a page from this book. This book is entitled "The Itinerary of a Breakfast," by J. H. Kellogg. Kellogg is a man who is more or less visionary, but, incidentally, all the scientific work of this sort that he presents is extremely valuable, for the reason that he employs the most expensive experts for his laboratory work, his chemical work, and all that sort of thing. Kellogg himself is more or less of a visionary, but you have to have visionaries to bring things forward and find out the real merit, and when we come to quotations such as I am going to use here they mean the result of work of highly paid experts, and the statements I am giving you here are agreed to by the chemists throughout the world, because they have been presented before scientific bodies in different parts of the world. One pound of walnut meats equals in food 4 pounds of lean beef. I will save the time of this committee by making only a few quotations. One pound of walnut meats equal 5.51 pounds of veal in food value.

One pound of walnut meats is equal to 13.51 pounds of oysters, 22 pounds of lobsters, and 5 pounds of eggs. The great economic importance is best shown by comparing the amount of food which may be annually produced by an acre of land planted to nut trees, and the same area devoted to the production of beef. Two acres of land and two years are required to produce a steer weighing 600 pounds. The product of one acre for one year, therefore, would be 140 or 150-pound steer. The same land planted to walnut trees would produce an average of at least 100 pounds per tree per annum for the first 20 years.

I could quote more extensively but I just want to quote enough to give you a clue of what we are after. I think that is the essential point that I would make.

Now, the work of finding the trees that are best adapted to different soils, the experimental work required for developing the industry, means a great deal of annual expenditure. I have expended a good many thousands of dollars myself in order to find what trees will grow best in Connecticut; what I can grow as a commercial crop in Connecticut.

The very first question of your committee will be: "Well, what have you got out of it up to date?" Now, I will tell you. The chestnut blight has wiped out practically all of our American chestnuts. I set to work and got 26 kinds of chestnuts from all parts of the world to find what ones resisted blight, and I found that four different kinds resisted naturally the blight pretty well. One of these was a great big coarse chestnut that came from Northern China, not of very much use except for cooking. They use it for food in place of the potato in China. Another one was our little American chinkapin. Now, the big Chinese one is too coarse for the American market, and the American chinkapin is too small for practical purposes. I crossed them or hybridized them. I also crossed the Chinese one that resisted the blight very well with our American chestnut. The various experiments required several years of time.

I had to have my employees carry on the work with me and for me, incidentally, of course, with their other work, and out of that I have developed a very large number of hybrid chestnuts. Out of the very large number of hybrid chestnuts, several thousands, most of them, are worthless.

The reason why they are worthless is because nature tries always to establish a mean type, an average type in everything, among men as well as among plants and among animals, so in making hybrids, nature is all the way throwing back from the remarkable kind to the mean type, so that it becomes necessary to make a great many hybrids. I made thousands, and out of that lot I have three that are immensely valuable. They resist the blight, they are large, they are fine in quality, and they combine the good qualities of chestnuts which are desirable. What have I done with these three kinds? I have made a present of them to a commercial nut grower, Mr. J. F. Jones, of Lancaster, Pa., whose whole nursery business is devoted to the growing of nut trees. He is a specialist in grafted nut trees. So, after all of this work and expenditure, I have personally made a present in the interest of public service to a commercial dealer of a fine hybrid chestnut which I have developed, and which will now go out to the world.

They will help add to our food supply. I am quoting just one instance for the sake of brevity, in order not to take up the time of the committee. I might quote many other instances, but this will open up a light of questioning, and I would like to answer any questions.

Mr. PURNELL. I would like to ask the relative food value of the various nuts.

Mr. MORRIS. I have that right here, briefly, I think.

Mr. PURNELL. You gave the food value of the walnut, and I wondered how it compared with the others.

Dr. MORRIS. I can give you that. I can make a statement about it offhand, but it will not be absolutely accurate. We have two classes of food nuts, one represents a high content of protein and fats. That is the pecan hickory, as an example. On the other hand, we have the group representing a very large starch content. That would include the chestnuts, for example. There are a great many nuts of the high protein group and a good many kinds of nuts of the high starch group and each has its relative position in regard to the food supply of the world, and we have to find where these various kinds can be raised to advantage. Does that answer your question?

Mr. PURNELL. I think so.

Mr. LEE. Can the pecan be grown in Connecticut?

Dr. MORRIS. Yes; we do not know to what extent the pecan may be grown in Connecticut, and that is one of the things to which I have gone to expensive experimentations to determine. I have had many hundreds of dollars' worth killed because I found that they did not come from the right pecan belt. I had many hundreds of dollars worth prove unprofitable because I did not select the right kind. I have found a few that will grow in Connecticut, and that means a great extension of range of this food supply, and that is one of the fields for investigation on the part of a paternal Government, as will be done in Germany. This personal expenditure

on my part of many hundreds of dollars has been for the purpose of seeing if this source of food supply could be extended as far north as Connecticut, a question not yet settled.

The CHAIRMAN. Do you expect to grow them as far north as Connecticut?

Dr. MORRIS. Yes; there is a very fine pecan tree in the Capitol grounds at Hartford, but there is no pecan tree near it to furnish pollen and that is probably not a self fertilizing tree. The chief trouble with pecans there would be the difficulty of getting them to ripen, because the required ripening period is long. I have to find kinds that will ripen there, and most varieties, coming as they do from farther south, require 30 to 60 days more of sunshine than we have in Connecticut before frost.

Mr. MCKINLEY. We have always had pecan trees in Illinois. Is not that as far north as Connecticut?

Dr. MORRIS. No; I think you have pecans only on the southern and southwestern border of Illinois.

Mr. MCKINLEY. We have them in central Illinois and along the Illinois River bottom. They are not thin-shell pecans like these.

Dr. MORRIS. Of course, you know about that better than I do. Wherever the pecan grows in an indigenous way, there it may be developed in a commercial way and in such a way as to give a very large return upon the expenditure of a small amount of labor to the acre. They told me down in Louisiana about an old colored man who worked very hard for years to support his family, and while he raised cotton and corn, he managed to be a fairly good provider, and now he is all crippled up with rheumatism and the poor old fellow can not work any more, but he makes six times as much as he ever did when he could work, because he set out some pecan trees. Now, that same history can be widely extended.

Mr. WILSON. Are not the best pecans raised in the South?

Dr. MORRIS. Yes; and that is another reason for investigation. You see we have got also to place the black walnut. That has an enormous range in the North.

Mr. WILSON. The southern pecan excels the California pecan, does it not?

Dr. MORRIS. In extractives that give quality, yes; but perhaps not in actual food value, except for the fact that where you have fine quality you have what we call vitamins, a chemical product that we have not placed yet in scientific chemistry, but what we call the vitamin gives zest to the eating of the nut.

Mr. PURNELL. How long does it take a pecan to bear?

Dr. MORRIS. Grafted pecan trees will sometimes bear in the nursery row the year after they are set out. The Stuart and the Schley both have a record of producing filled nuts in a year after they were set out.

Mr. WILSON. You planted the tree, though?

Dr. MORRIS. These are all grafted.

Mr. WILSON. It takes four or five years, does it not?

Dr. MORRIS. No. Mr. Jones, for instance, having grafted his stocks with the Stuart and the Schley varieties found in the following year that he had Stuart and Schley pecans growing on those grafts.

Mr. WILSON. But not in commercial quantities?

Dr. MORRIS. Oh, no; please do not misunderstand me.

Mr. WILSON. That is what I am getting at.

Dr. MORRIS. From the serious side of the question, we should make comparison with apples. The various kinds of nuts, grafted trees, will bear about like apples. For instance, the Yellow Transparent apple will frequently bear in a year after it is set out. The Northern Spy usually in about 12 years after it is set out. So the Stuart pecan may bear in the second year after it is set out, and another variety may not bear until 12 or 15 years afterwards. They will range about like apples. The nuts are fruits like apples and will have practically the same biologic history. Commercially speaking pecan orchards must be 10 or 12 years old, from the time they are transplanted from the nursery to give profitable returns.

Mr. MCKINLEY. Doctor, compare a pound of the different nuts with the various meats in food value.

Dr. MORRIS. Yes. I happen to have statistics, for instance, on pecans alone. Pecans stand highest in nitrogen value. I did not mark the pages in this book because I did not know the committee would want this information, but I can turn to it in just a moment. I can state it in calories—heat units:

The almond in protein stands first with 21 per cent of protein, 54 per cent of fats, 17 and a fraction per cent of carbohydrates.

The pecan hickory, protein 11 per cent, fats 71 and a fraction per cent, carbohydrates 13 and a fraction per cent.

Mr. MCKINLEY. That would be more like fat pork.

Dr. MORRIS. Yes; but it is an available fat that is digested; in fact, the only thing that approaches the pecan nut in food value is bacon, and the pecan nut has a slightly greater food value than bacon. The chestnut, the pine nut, and also the hazelnut will furnish an enormous food supply for the people in the North.

Mr. MCKINLEY. In what kind of soil does the pecan nut thrive best?

Dr. MORRIS. It thrives best in alluvial, loam, well-drained river bottoms. That is where it belongs, but, like many other trees, under intelligent care it may be carried far out of its indigenous soil, like the apple. For instance, the Baldwin will grow in clay, will grow in sand, will grow in soil with an acid reaction, and many of the nut trees may be made to live far out of their natural, indigenous range and out of their natural soil, but that is a matter requiring expensive expenditure on the part of experimenters to determine. That is precisely one of the reasons why large funds should be at the disposal of the men who are getting the facts in this matter.

Mr. MCKINLEY. Doctor, if the pecan requires a rich alluvial soil, how is it that it thrives in Congressman Lee's district down in Georgia?

Mr. LEE. I want to know why it does not thrive in Mr. McKinley's district in Illinois. Is it for the same reason?

Dr. MORRIS. I do not admit the premises of this bit of levity. The premises are not correct. They are stated in a negative way. The positive fact is that the kind of pecan which thrives best in rich alluvial soil, grafted to some scrub stock that has learned to live on poor soil, will keep on producing the kind of fine nut that originally belonged to that variety.

Mr. MCKINLEY. Aside from any joking, the point is whether the pecan should be planted generally on that kind of soil. Take it even in Illinois, the soil upon which most of the forests grow is not the better soil, but more of a clay soil.

Dr. MORRIS. There will be kinds that may be planted there to advantage, and when we find as a result of expensive experiment what stocks will thrive there best, then we graft those stocks over to fine types.

Mr. MCKINLEY. And then you get the good nuts?

Dr. MORRIS. Then you get the fine nuts. The grafted top retains its identity just as the Baldwin apple or the seckel pear.

Mr. VOIGT. Can you graft a pecan onto any other kind of stock. I am ignorant about this matter.

Dr. MORRIS. That is a very appropriate question. No; you can graft it on any of the numerous varieties of pecan stock. But it so happens that it is not commercially practical to graft the pecan upon other kinds of hickory. However, the reverse is not true. We have 15 species of hickory in this country and hundreds of varieties, and almost any hickory will grow on pecan stocks, so that it is very valuable as a grafting stock for other kinds of hickories. The commercial dealers in grafting nut trees use the pecan very largely for a commercial stock for other kinds, just as in cherry trees they use another stock for many kinds of cherries.

Mr. PURNELL. Let me ask you another question, which may be a little out of line; but you are a doctor, and I would like to know as a matter of information. Nuts, as a rule, are hard to digest, are they not?

Dr. MORRIS. Yes and no. Nuts which are eaten between meals are apt to upset digestion. Nuts which are not thoroughly chewed are apt to be difficult of digestion. Nuts properly prepared are quite as digestible, if not more so, than meats; that is, nuts of the protein group and also nuts of the starchy group.

Mr. PURNELL. What do you mean by being properly prepared?

Dr. MORRIS. At a number of the sanitariums where nuts are used in place of meats some are cooked, some are rolled or ground, and some are prepared by milling. There are various ways of preparing them for cooking so that they may become digestible. On the whole, as a general statement, they are quite as digestible as any of the meats or starches that we now use.

Mr. VOIGT. What commercial crop of nuts can you grow in Connecticut?

Dr. MORRIS. The nuts we grow commercially in Connecticut would be hybrid chestnuts, filberts, black walnuts, shagbark hickories, and some of the pine nuts, although I do not know of any of the pine nuts yet that have been put on the market from there.

Mr. VOIGT. Does it pay to grow hickory nuts on a commercial basis?

Dr. MORRIS. Yes, indeed. The shagbark hickories are selling at the present time for an abnormal price, \$14 a bushel for fine shagbarks. It would not do to quote any such price as that except under abnormal conditions, but they are now getting \$14, and it would be quite safe to say that the average crop of a good shagbark hickory tree would be 2 bushels per year.

Mr. LEE. Is that what we call the scaly-bark hickory?

Dr. MORRIS. Yes; the names scaly bark, shellbark, and shagbark are used indiscriminately with reference to the kind of hickory that has a trunk bark that shells off.

Mr. WILSON. What is the commercial value of walnuts?

Dr. MORRIS. As to the black walnut, Mr. E. A. Riehl, of Illinois, told me last year that he got \$8 per bushel for his black walnuts, and some of his trees had 14 bushels to the tree. If these trees were planted 17 to the acre, that would make them 50 feet apart, so you can estimate the food that would come from an acre of Mr. Riehl's land on that basis. No possible meat supply, no possible potato or other annual crop supply could approach in food value or in commercial value on such acre.

Mr. WILSON. Does that mean the walnuts in the shell?

Dr. MORRIS. No; that means the net result. He collected his walnuts, shelled them, and I do not know whether he got money for his shucks, but last year the soft outer husk of the black walnut was used by the dyers and had a commercial value, and the hard shell of the nut had a commercial value for gas masks and for similar purposes. The meat itself had a commercial value for food purposes: My recollection is that Mr. Riehl told me his black walnuts netted him \$8 per bushel and that he had 14 bushels to the tree. I am speaking from memory of what Mr. Riehl said to me.

Mr. McLAUGHLIN of Michigan. What kind of work do you desire to have done by the Government?

Dr. MORRIS. The Government needs to expend a great deal of money for the purpose of investigating the various nut problems which are now being investigated expensively by men who are commercially or scientifically interested and who are making the expenditures on their own account, in regard to finding the right soil for the right kinds, hunting up new varieties, hunting up or making hybrids, finding what ones are adaptable; and, in fact, the opportunity for expenditure in this large, new, coming agriculture is so great that I can hardly condense it in the form of a direct answer to that question.

Mr. McLAUGHLIN of Michigan. Are there serious diseases?

Dr. MORRIS. Yes; and those must be investigated.

Mr. McLAUGHLIN of Michigan. What are they?

Dr. MORRIS. There have been whole books written on the subject of diseases which would apply to nut trees, and an investigation and a knowledge of any one disease that could be had from our authorities on the subject might save any grower many thousands of dollars.

Mr. McLAUGHLIN of Michigan. Are the private growers making any progress in learning what the diseases are and how to treat them?

Dr. MORRIS. Yes; I have learned that I can not raise certain kinds of trees on my property in Connecticut to advantage. I have found, on the other hand, that I can raise things in my section that can not be raised in another section because of the diseases prevalent there.

The CHAIRMAN. We are grateful to you, Dr. Morris.

Mr. PATTERSON. To give you an idea, gentlemen, of the relative importance of the nut industry, I asked the Bureau of Crop Estimates to give me certain data regarding the three commercial nuts,

the almond, the walnut, and the pecan, up to date. I received these figures from the bureau last night. Just to give the committee an idea of the size of the industry, the almond crop this year amounted to 6,500 tons. The Persian walnut crop this year totaled 24,000 tons.

Mr. MCKINLEY. Put some dollar values to that.

Mr. PATTERSON. Yes, sir. The almond crop is figured by the California Almond Growers' Exchange at \$3,000,000. The Persian walnut crop has been put by the California Growers' Association at \$15,000,000. We have not yet gotten the statistics for what we call seedlings or wild pecans. The Bureau of Crop Estimates does not have facilities for getting the facts segregating the seedling and the cultivated pecan. But the production of all pecans for the current year, as near as can be told to-day, is 45,615,000 pounds, of a value of something like \$9,000,000. Now, we are asking this committee to increase the appropriation for this year for the investigation of cultural problems pertaining to all nuts, for the Bureau of Plant Industry, represented by Mr. Taylor, who I am glad to see is with us this morning. And while the commercial nuts to-day are the almond, the walnut, and the pecan, the black walnut is coming to be quite prominent, and I am going to ask Mr. Thomas P. Littlepage, of this city, a lawyer by profession, and also a nut (laughter), to tell this committee what can be accomplished.

The CHAIRMAN. We will be glad to hear from Mr. Littlepage.

STATEMENT OF MR. THOMAS P. LITTLEPAGE, OF WASHINGTON. D. C.

Mr. LITTLEPAGE. Gentlemen of the committee, I do not want to take up much time. As Mr. Patterson says, I am a lawyer in Washington and a farmer in Maryland. Out in Maryland they think I am a fine lawyer in Washington, and here they think I am a fine farmer in Maryland. So, being in that situation, I can say to this committee just a few words.

What you gentlemen would like to know is how well the Bureau of Plant Industry will spend this money if it is given to them and whether they really need it.

Mr. PURNELL. I think, Mr. Littlepage, there is something else we are going to have to know before that. We first want to know where we are going to get the money.

Mr. LITTLEPAGE. I can sympathize with that situation. That is my normal condition. [Laughter.] I happen to know something about how the Department of Agriculture spends the appropriations for nut work. I have gone over the whole country in looking over this nut question as a side hobby of mine. I have been through Illinois, and I will say, Mr. McKinley, that the State of Illinois has perhaps more wild northern pecan trees than any other State in the Union. Next comes Kentucky, and Indiana perhaps third. I have been over the country and am not now going to undertake to discuss these various details and problems, but I want to touch on the one point as to how the Department of Agriculture spends the money that it comes here and asks you gentlemen to give it.

I want to make this general conclusion in the beginning, that I wish I might have the committee's time to tell you more in detail about. I doubt if you gentlemen have ever appropriated money for the Department of Agriculture that is better handled, more carefully spent, with better results, than the money you have given them for these nut investigations. I happen to know a great deal about that both in the North, the South, the East, and the West, and the various problems and the importance of nuts, because it is my side hobby. The money has been well spent. They have not half enough.

There are as many problems, gentlemen, in connection with this big industry that is now growing, that is now starting—there are just as many problems as it is possible to have. Your timber problem is one of them; your soil conditions is one of them; your distribution of varieties and all of these things are a part of those problems. You gentlemen here have been eating the finest pecan that grows and yet throughout all the South are set thousands and tens of thousands of trees of worthless pecans, practically worthless, because when they were set out nobody told the growers there was a better variety or that theirs was not a good one. And there have been thousands and tens of thousands of pecan trees raised in one section of the country that, when taken into another section of the country, proved seriously subject to disease because nobody told them differently. Now, the Department of Agriculture has been doing some most wonderful work along the line of getting these facts together about pecans, walnuts, hazelnuts, and all these other varieties, and about that work I happen to know. I have not a dollar's interest in it except that I have a lot of pecan trees. I have a northern nut orchard out here in Maryland and some more down in Indiana, and I happen to know something about it. So I am merely speaking as an independent bystander who happens to know something about it.

Mr. WILSON. That Indiana nut is not any good, is it?

Mr. LITTLEPAGE. That goes into one phase of this. The northern pecan is separate and distinct in a way, that is, botanically speaking. The northern pecans are growing out in Indiana and Illinois. One of the finest pecans I have ever examined is the Niblack from southern Indiana. Another is the Busseron from Knox County, Ind., on the thirty-ninth parallel, near the western boundary of Indiana. Pecans grow away up in Rock Island, Ill., and on the banks of the Wabash in northern Indiana and all through that section. There is a type of wild pecan that grows on the banks of the Ohio River 9 miles south of Evansville, Ind., where there is a wild grove of 700 or 800 acres of exclusive pecan trees—one of the most beautiful forest sights I have ever seen.

Mr. MCKINLEY. As I gather it, this class of pecan could be grafted on all these wild trees; is that right?

Mr. LITTLEPAGE. That nut on the table is a southern pecan, Mr. McKinley, known as the Schley. It is the famous Schley, now the leading variety, I think, that grows in the South.

Mr. MCKINLEY. Will these thrive if grafted on to the northern trees?

Mr. LITTLEPAGE. Not up there. You might just as well set out orange trees. People to-day all through the north are buying thou-

sands and tens of thousands of southern trees and setting them out in the North, when they might just as well bring an orange tree and set it out up there. That is one of the questions in this nut situation.

Mr. WILSON. That is done through the nursery agents?

Mr. LITTLEPAGE. It is done through the nursery agents partly because they have not the information at hand. Nearly everybody to-day throughout the country is setting out nut trees, and they are buying where they can get them. The Department of Agriculture has done wonderful work in trying to straighten out this question, in telling where pecan trees will or will not grow. It is just as important to know where a thing will not succeed as it is to know where it will succeed. But they have not had adequate facilities nor enough money for this branch of the work. It now has an appropriation of something like \$20,000 a year for this purpose. It should have three times that much.

Dr. MORRIS. Speaking about fake advertising—

Mr. WILSON. That is what I had in mind to ask about. Are those agencies selling any kind of stock?

Mr. LITTLEPAGE. Those promoters are fellows we have been fighting through our nut-growers' associations for years, trying to keep them out and to clean up the situation. That is just one of the various problems connected with the industry.

As I said in the beginning, I just want to take a minute or two to say to you that I know how the Department of Agriculture spends this money, and I know that is one thing you would like to know—whether or not, if you give them more money, it is going to be spent right. I am here to say that it will, because I know the men in the organization; I know what they want to do with it, I know how they do it, and I know the men who are doing it.

The CHAIRMAN. Thank you, Mr. Littlepage.

FURTHER STATEMENT OF MR. J. M. PATTERSON, OF PUTNEY, GA., REPRESENTING THE NATIONAL NUT GROWERS' ASSOCIATION.

Mr. PATTERSON. I represent the National Nut Growers' Association and also the Paper-shell Pecan Growers' Association of Georgia. The former is a society composed of pecan growers; the latter is a commercial organization owning approximately about 5,000 acres of cultivated pecans, ranging from 12 years old down to those recently planted. For several years the Department of Agriculture has been conducting, and is to-day conducting, experiments in our orchards. These we are encouraging in every way and giving all the help we can, backing up the experiments by spending our own money to carry out on a large scale the experiments that are being conducted in a small way. The department men are doing splendid work. The only trouble is, gentlemen, they have not money enough to put sufficient men on to undertake the solution of all the problems that are troubling us.

You perhaps notice on the kernels of some of those pecans you are eating occasional black spots. That is what we call the kernel spot. We do not know what causes it; we do not know what it is. Some years 50 per cent of that variety (the Schley) will be affected, rendering the kernels bitter and unfit for consumption.

Mr. WILSON. Does it spoil the taste of them?

Mr. PATTERSON. Yes, sir; it makes the kernels bitter. I did not know those nuts had any spots until I opened the box and washed some of them a little while ago. That spot is one of the many problems. If there were sufficient funds, say \$50,000 or \$60,000, for the Bureau of Plant Industry for the next few years, it could put on enough scientific men to work out these various problems in the next five years; otherwise, in all human probability, the solution of all these problems with the present appropriations will take 25 years to work out. When you gentlemen remember that there are now something like 165,000 acres of pecan orchards in existence, and that pecan growing is a new industry, and that it takes 10 and 12 years to bring an orchard into commercial bearing (they tell you the trees will bear in a few years, which is all true, but it will only be a few scattered nuts; commercially, even in the South, in Georgia, where I come from, which is perhaps as favorable a section of the country for early bearing as any, we do not get commercial crops of nuts until 10 or 12 years after the trees are set out, and we set out 3-year-old trees), you will realize that it is a long, tedious process. Very often, when the trees mature, after 10 years or more of labor, we find some new disease, insect pest, or some other condition that, as practical men, we are not able to solve. It takes scientific men to solve such problems.

Speaking especially for the pecans, because that is my hobby, I want to call your attention to just a few more statistics and then I am through. The domestic production of the United States this last year, the total for the almonds, walnuts, and pecans, is estimated by the Bureau of Crop Estimates at 106,000,000 pounds. During the year ending July 1, 1918, which is the last year for which we have statistics, this country imported, in round numbers, 30,000,000 pounds of almonds, 11,000,000 pounds of Persian walnuts and, in addition, consumed all we raised. So you see this is a nut-eating country, but not yet sufficiently a nut-producing country to supply the domestic demand.

The walnuts have increased in value in the last 10 years between four and five times their annual production, and almonds about three and a quarter times. The pecan has come forward faster than any other and has increased ten times in 10 years. In other words, the production to-day is ten times what it was 10 years ago.

No man can tell what the total investment in nut orchards is, but it is well up in the millions; probably \$150,000,000 is invested in these various nut industries. All we ask, gentlemen, is that you make available a sufficient appropriation to the Department of Agriculture so it can put scientific men at work on these many problems in order that we can begin to get something like the maximum return from the great investment represented and from the long and tedious years of toil we have been through.

I see Dr. Taylor, head of the Bureau of Plant Industry, is here this morning. I would very much like to have this committee hear him. I am sure he can give you any information I have failed to give.

Mr. McLAUGHLIN of Michigan. Have the States been making any appropriations for the kind of work you wish to have done?

Mr. PATTERSON. No, sir; not that I know of, Mr. McLaughlin. We have tried to get some appropriations in Georgia and the State is

doing some little investigational work, but without special appropriation for pecans.

Dr. MORRIS. How about Michigan recently?

Mr. PATTERSON. Michigan has made a good big appropriation, something like \$50,000, Mr. McLaughlin, for planting nut trees along the public highways. At the convention at Battle Creek last week a representative of the Michigan Department of Agriculture explained about the effort Michigan was making to produce nuts along the highways.

Mr. MCKINLEY. Take your 5,000 acres; what kind of land is that? What I am trying to get in my head is whether timberland is used or whether you have to have the best land.

Mr. PATTERSON. I would not take a piece of cut-over timberland and plant pecans on it as a gift. We have always purchased old plantations, Mr. McKinley, land that is cleared. A good deal of that kind of soil is badly exhausted and to build it up is quite a problem. It is one of the most important problems we have.

Mr. MCKINLEY. Do you have to use fertilizer?

Mr. PATTERSON. We have used commercial fertilizer, but are now planting legumes, cowpeas, and velvet beans and plowing them under as a means of improving the soil. Lately we have discontinued the use of commercial fertilizer on account of its high cost. As soon as prices permit—we are making experiments with fertilizers best adapted to it—we expect to resume the use of commercial fertilizer in connection with leguminous crops.

Mr. JONES. What is the objection to the cut-over land?

Mr. PATTERSON. The stumps, to start with.

Mr. JONES. They interfere with cultivation?

Mr. PATTERSON. They interfere with cultivation. Then the lice, incident to the old roots, kill the pecan roots—just eat them up and kill the orchards.

Mr. TINCER. Mr. Chairman, I understand there was only 40 minutes allotted to this hearing. I do not think we ought to start in hearing any member of the department on it, because we will have them here later.

The CHAIRMAN. We heard Dr. Taylor the other day on this item. Have you anything further to add generally as to the appropriation needed for nut investigation, Dr. Taylor?

FURTHER STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. TAYLOR. Nothing, perhaps, except to say that nut culture is, as has been indicated, an infant industry. The almond and the Persian walnut are old-timers from the Old World; they have found a foothold on the Pacific coast.

Our nut-culture problems in this country are new. The wild trees, in a certain sense, are climbing out of the forests into the cultivated land, so that it is a new industry with big, potential possibilities which need to be worked out.

Mr. McLAUGHLIN of Michigan. The only suggestion I have to make is something for Dr. Taylor and the other gentlemen to take

up together. For some time we have carried an appropriation for the general investigation of nuts; and a year ago, or not long ago, we added another appropriation for pecans. Now, it seems to me, it is not advisable to add a separate appropriation for each of the nuts. And I suggest you figure out some plan by which an appropriation can be made for the general nut proposition. Would not that be a good idea, Doctor?

Dr. TAYLOR. Historically, Mr. Chairman, the situation is about like this: There was a specific proviso for the pecan, amounting to \$9,000, up until this year. As the result of a Senate amendment, \$11,000 was added to that and the authority was broadened to cover the various nuts so that the appropriation carries now \$20,000 for all the nuts. The department's estimate, made last spring for the work which the nut industry desired to have done, was \$40,000, and in conference the appropriation came through \$20,000. So that is, I think, the present situation.

The CHAIRMAN. Just one question, Mr. Patterson: Would you have objection to eliminating language that refers to any specific nut?

Mr. PATTERSON. No; we prefer it as it is carrying the appropriation for all the nuts, Mr. Chairman.

The CHAIRMAN. And not mention the pecan?

Mr. PATTERSON. That is the way it is now; yes. As it stands now there are two specific appropriations for pecan diseases and insects, small appropriations. We are not asking any increase in those, but this appropriation for the bureau which Dr. Taylor represents includes all nuts.

I want to say this, if you please: The other day I said Mr. Tucker, manager of the California Almond Growers' Exchange, would be present. By telegraphic communication with Mr. Tucker I found it was utterly impossible for him to get here. He is in Boston. I would like to ask permission for Mr. Tucker to file his statement with the committee.

The CHAIRMAN. Without objection, it is so ordered.

Thank you very much, gentlemen.

FRIDAY, JANUARY 9, 1920.

The CHAIRMAN. There are two Members of Congress from Texas in the committee room this morning who desire to be heard on the appropriation for the nut industry. Mr. Hudspeth and Mr. Briggs. We will be very glad to hear you.

STATEMENT OF HON. C. B. HUDSPETH, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TEXAS.

Mr. HUDSPETH. Mr. Chairman and gentlemen of the committee, I appear before the committee this morning as the representative of the nuts of Texas, that is, the pecans. Under the appropriation that was made last session by this committee, raising the appropriation from \$8,000 to \$20,000, I have a letter here from the president of the Nut Growers' Association in which he states that the Government established an experimental station in Texas and under the grafting

that was done they have yielded a crop of \$100,000 where they were not yielding anything. In this letter he estimates if the work is continued throughout the waste places in Texas on the overflow bottoms that are now producing practically nothing, except just small pecans and the appropriation raised to \$40,000, that Texas alone will be producing in the next few years from \$5,000,000 to \$10,000,000 worth of nuts from this overflow land.

He takes occasion in this letter to thank this committee for the raise they gave at the last session from eight to twenty thousand, and I assure you gentlemen, from the knowledge I have of this man in charge down there (who is also connected with the Texas Agriculture Department), that it has been wisely spent.

Mr. McLAUGHLIN of Michigan. What kind of a station have they?

Mr. HUDSPETH. They have a station there experimenting in the growth of pecans and development in the grafting of large pecans on these wild trees that are now practically producing nothing. They also state to me, Congressmen, that where the wild growth only matures possibly every three or four years, by this method they have of grafting the pecan upon those trees, they will produce every year that the frost does not blight it. It matures later than the wild growth.

Mr. McLAUGHLIN of Michigan. Does a tree mature nuts the first year after grafting?

Mr. HUDSPETH. That is my understanding, that they will produce nuts the first year after grafting.

Mr. McLAUGHLIN of Michigan. How many men have been employed at that station?

Mr. HUDSPETH. They only have one, Mr. A. Caswell Ellis. He has been going over those waste places, those overflow bottoms, and taking those wild trees, as I state, that only bear possibly every three or four years and grafting on those trees a pecan that will bear every year.

Mr. McLAUGHLIN of Michigan. Do you know how \$20,000 was expended by the employment of one man?

Mr. HUDSPETH. There is one station. I take it Mr. Ellis has, of course, a great many men under him, but he is the chief director down there. This man Ellis certainly could not do all that work alone, you know.

The CHAIRMAN. They cover a number of States under this appropriation.

Mr. HUDSPETH. This appropriation covers the United States and they have established one station there in Texas which seems to be under the direction of Mr. Ellis, who, for many years, was engaged in this business under the agricultural department of Texas.

Mr. HEFLIN. How much did you say had been spent at that station?

Mr. HUDSPETH. I do not know how much has been spent at that station, but he says this:

Thanks to the good work of the Texas delegation, the appropriation for nut work was raised from \$8,000 to \$20,000. I am glad to say that one of the experiment stations that the department has started to work on is in Texas. This station, if supported by Congress, ought in a few years to revolutionize the nut industry in Texas. I know from my own personal experience with my top-grafted pecan trees that Texas has enough wild trees and overflow creek and river bottoms to be producing each year at a nominal cost a hundred-million-dollar crop of pecans.

Mr. McLAUGHLIN of Michigan. You say Mr. Ellis was for a long time employed by the State?

Mr. HUDSPETH. Yes.

Mr. McLAUGHLIN of Michigan. In similar work?

Mr. HUDSPETH. In similar work; yes.

Mr. McLAUGHLIN of Michigan. Can you account for the fact that in all those years he produced nothing, when in this one year, under Federal employment, he produced so much?

Mr. HUDSPETH. No; I can not. I do not know what he produced while he was under the State. The State made a very small appropriation for this work and I do not know what he produced under that, but this is what he has done under the Federal Government.

The CHAIRMAN. They are developing the paper-shell pecan?

Mr. HUDSPETH. Yes; the paper-shell pecan.

The CHAIRMAN. Is that a new discovery?

Mr. HUDSPETH. I have known of it in my State but two or three years—the paper-shell pecan. Mr. Ellis goes on to state:

The so-called English walnuts, the black walnuts, almonds, hickories, hazel nuts, chestnuts, and other nuts offer similar opportunities in every State in which agriculture or forestry is possible.

It is absolutely essential that this appropriation be continued and gradually enlarged. It is, of course, absurd to be trying to develop the nut industry in this vast empire on \$20,000. We spend millions wisely on animal industry, for example, and yet nuts, both on grounds of health and economy, can and soon will play as large a part in supporting our population as do animals.

I am no vegetarian, but know that a mixed diet is best and that nut trees will furnish several times as much nourishment per acre as will animal industry. By the application of a little science to the problems of varietal adaptation, methods of propagating, fertilizing, irrigation, harvesting, storing, marketing, etc., this Nation can soon produce a billion dollar nut crop on what are now largely waste hillsides, roadsides, and overflow bottoms.

As there are many nuts and many different sections of the country, the experiments must be broadened and those already planned, including the one in Texas, perfected. Therefore I write to ask if you will not personally see the Agricultural Committee at once and ask them to make an appropriation of not less than forty or fifty thousand dollars this time for the nut industry.

That is the work he has been doing down there, gentlemen.

Mr. TINCHER. How much is the State of Texas appropriating for this work?

Mr. HUDSPETH. I do not know what it is appropriating now. Mr. Tinchler, but it has been a very small sum. Until this man developed this paper-shell pecan, I will be frank with you and say the State of Texas did not think he was doing anything. But since he has developed the paper-shell pecan and grafted it on those wild trees and made them produce every year, although I have not been in the State legislature for two years down there, I would like to state that the State would wake up and make a better appropriation. That is what Mr. Ellis states, whom I know personally, a man who makes a study of those methods and who has made a success in grafting this paper-shell pecan on to those wild trees down there, that did not produce anything, on the overflow bottoms.

The money you gentlemen appropriated at the last session, this \$20,000, I do not know how much of that has been spent in Texas. I know they established one station down there and they have made wonderful development in the grafting of these pecans I have just

explained. There are other Members here from Texas, and I believe Mr. Briggs has a statement to make.

The CHAIRMAN. Thank you, Mr. Hudspeth. The committee will now hear Mr. Briggs, of Texas.

STATEMENT OF HON. CLAY S. BRIGGS, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TEXAS.

Mr. BRIGGS. Gentlemen, Mr. Hudspeth has rather fully covered the ground with reference to the nut-industry situation. I do not profess to be an expert in this field but I do know that in Texas, as in many other States of the Union, a great deal of attention has been given to this industry. But it requires direction; it requires education; and it requires the solution of some of the problems in order to get the best results in this country.

The nut industry is perhaps engaging more attention from the people generally, and there is a greater consumption of nuts in this country than ever before.

I have been interested in looking through the hearings already had before this committee, and I have noticed that the pecan or pecan-hickory industry has grown ten times greater in one year than it has in previous times. In other words, it is worth about \$14,000,000 to the Nation.

Pecans are not only used now in the States where they are grown, but they are used in all the markets in the United States. You will find them everywhere, and you will find that the nutritive value is being appreciated more and more by the people in these days of the high cost of living because you can get a greater amount of nutriment out of a small quantity of nuts than you possibly can out of almost any other food of other qualities and character.

Texas is interested, and so is the Federal Government with its power of comparing results throughout the Nation and collecting the information and getting the data which will enable the people to determine which is the best varietal adaptation of soil, the best methods of propagation and fertilization, irrigation, harvesting, marketing, and storing—all of the highest value now. In fact, I believe, not alone in Texas but in every other State in the Union where they grow nuts of any variety as well, it will be of inestimable value to this Nation to get an adequate appropriation for the carrying on of that experimental work.

Mr. Hudspeth stated that Congress allowed at the last session \$20,000 for that work. There were various estimates made of the amount needed. In one of the letters that came to me to-day, between \$40,000 and \$50,000 was requested. In another letter from one of the agents of the Department of Agriculture, in the State of Texas, it is estimated that if \$50,000 were appropriated by the Government for nut-industry development and experimental work that it would be of inestimable value.

Here I want to make it plain that this is not a Texas proposition. The Texas Representatives are interested, it is true, because of the great opportunities there for the development of the nut industry in Texas. But the almond industry in California, the hickory-nut in-

dustry in the North, the chestnut industry in the New England States and in the Middle Atlantic States; in fact, in the Central States, I think, it was testified to by the representatives of the Department of Agriculture you could get excellent results with pecans and varieties of hickory nuts, with walnuts, and nuts of other characters.

It is those things that are appealing so strongly now to the citizens of Louisiana and Florida, where the soft-shell variety of pecans are produced by careful cultivation bestowed upon the nuts, which are bringing in the market from \$1 to \$1.50 a pound in the shell for these large, so-called jumbo variety of soft-shelled pecans.

Texas has unlimited quantities of pecan trees all throughout my district, along the river bottoms, where these trees grow wild and have done so for years and years; and no utilization scarcely is made of them in many quarters except that the hogs get in there and eat the nuts, which does improve the quality of the pork, I will admit. But the grafting process which has been testified to can be employed with profit. I refer to the grafting of high-grade pecan stock upon these wild trees which will develop and bring forth high-grade pecans, because the strength of the tree itself will support the grafted stock upon it, and the graft will determine the nature of the nuts produced.

It is such facts, and teaching the farmers and teaching the people who live in those localities the value of that process, the means of combating any diseases that attack these trees, and the methods of marketing and putting the nut product before the consuming public, which is not only to the advantage of the people who grow these pecans, but of advantage to the users of the pecan nuts, because it enables them to be distributed freely throughout the country, gives a better nut, and reduces costs when produced in large quantities. All this justifies, it seems to me, in the highest degree a liberal appropriation from the Agricultural Committee and from Congress to further carry on this work, and I hope and feel that the committee will make an appropriation of at least \$50,000 for this purpose.

Mr. McLAUGHLIN of Michigan. Are these large areas where these nuts grow still in private ownership?

Mr. BRIGGS. So far as lands are concerned; I think all the lands are. I do not know of any pecan trees on State owned or public lands in Texas. I think all of it is in private ownership.

Mr. HUDSPETH. They do grow on the State lands.

Mr. BRIGGS. The State still owns several million acres of these wild lands and offers to sell small parcels of them on long-time payments. Texas offers her public lands for sale on the most advantageous terms; upon 40 years time, upon the payment of a small rate of interest, and many of those lands are even now offered for sale without requirement of settlement.

But all through the river bottoms, where the pecans flourish, these trees grow luxuriantly in vast numbers. The cultivated pecan belt, I think, is largely in the western portion of Texas, out around San Angelo, mostly, and in that section, where they raise some of the larger varieties of pecans. They raise many in my district, but they are not of the larger variety. Many of those pecans have very hard shells; they do not appeal to the public. They could be bought cheaply if they could be graded up. The pecan will sell in the open

market at from 25 to 50 cents a pound this year because the crop is very large. But if the stock had been graded up you could get a very high quality of pecans for that price, whereas you now have to accept just what the market offers and are available; unless you pay for the choice stock, which comes from small sections of Louisiana and in a larger degree from the States of Florida and Georgia.

Mr. VOIGT. May I ask a question right there?

Mr. BRIGGS. Certainly.

Mr. VOIGT. You stated you have the remedy down there. What do you want this \$50,000 for?

Mr. BRIGGS. We did not say we had the remedy; I did not say that.

Mr. VOIGT. I understood you to say you had the remedy.

Mr. BRIGGS. You are mistaken if you understood me to say that I had the remedy.

Mr. HUDSPETH. That was with regards to the screw worm proposition. I had two propositions.

Mr. BRIGGS. In the letter that I have from the Nut Growers' Association it refers to the fact that the Government last year undertook to establish under the appropriation, I think, made at the last session of Congress, an experimental station in Texas. That station has just begun its work, as I understand, and the problems are before them to be solved. The testimony before this committee by the expert of the Department of Agriculture indicated that fact—that the problems are all before the Government.

Mr. ANDERSON. You have the remedy now of grafting?

Mr. BRIGGS. Yes; but that is not the only remedy. That is an old remedy. They state that the pecan is very much like the apple tree in many respects. But that is not the only remedy. It is necessary also to find out what stock will grow best in the various sections. In other words, it has been testified that there is a pecan tree growing in the courthouse yard in Hartford, Conn. They have a fine pecan tree, but that pecan tree does not bear because it has no other tree near by from which it can draw the required fertilizing pollen.

Mr. HUDSPETH. Pardon me, but the climate of Texas is just as different in the various parts as it is in some Northern and some Southern States.

Mr. BRIGGS. Yes; but I am not referring only to Texas.

Mr. HUDSPETH. There are variations of altitudes of 9,000 feet in Texas.

Mr. BRIGGS. I am not asking this appropriation alone for Texas; this is a national nut industry and it is not confined in this appropriation to the pecan industry as was originally provided in the bill last session. There was carried in that bill \$8,000 for the pecan industry.

The CHAIRMAN. The pecan industry started in Georgia?

Mr. BRIGGS. I believe so. The appropriation was increased to \$20,000 and designated for the cultivation and development of experimental work for all varieties of nuts everywhere throughout this Nation. I think the pecan is a splendid nut, as is shown in the testimony of the Department of Agriculture experts, and is known generally from use; and other nuts are before the people for development; and teaching the people and giving them the benefit of the knowledge as to how to cultivate these nuts, is the main purpose of

the Government in spending this money along educational lines. I say, therefore, that it redounds to the benefit of every State of the Union, and the work ought to be carried on, because, in my opinion, it brings back the biggest return to the Nation of any investment that you can make, and, after all, that is the wisdom of the investment of money by Congress in any product whatever.

The CHAIRMAN. Thank you, Mr. Briggs.

(The committee thereupon proceeded to consider another bureau.)

FRIDAY, DECEMBER 12, 1919—AFTERNOON SESSION—CONTINUED.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. How about item 102, on page 95, Dr. Taylor?

Dr. TAYLOR (reading). "For the investigation and improvement of fruits, and the method of fruit growing." By the way, I see this print has "method" of fruit growing. That word should be in the plural; it should be "methods" in the final text. We ask there an increase of \$5,000 specifically to make possible the undertaking of certain studies in the farm practice of fruit production; that is, the orchard practice, a topic which was covered for a time by the survey method in the Office of Farm Management.

Mr. ANDERSON. Is not that work already done?

Dr. TAYLOR. No; the reorganization of the farm management work, which has been made and put into effect involves the transfer of that type of work to the Bureau of Plant Industry.

Mr. ANDERSON. I do not know that it is just proper to go into the subject of the Bureau of Farm Management at this time, but I supposed that one of the things that would be done in connection with that bureau would be to gather together the various items relating to farm practice and management instead of separating them through the entire department.

Dr. TAYLOR. I think when you have the discussion of the Office of Farm Management reorganization, Mr. Anderson, that question will come out. Dr. H. C. Taylor has some very clear-cut ideas which I think are sound.

Item 103, "to cultivate and care for the gardens and grounds of the Department of Agriculture in the city of Washington." Under this item we maintain and care for the grounds of the department in Washington, maintain the greenhouses and propagating houses, the roads and drives, and the lighting and other features of the department grounds.

Mr. LEE. There is no change?

Dr. TAYLOR. No change there.

Item 104, page 97, "for horticultural investigations," covers our constructed work with the vegetable crops, and the estimates carry an increase of \$30,000 out of a total of \$101,940 provided here.

The first item is \$10,000 for the technical study necessary in the investigation of the storage of vegetables. This is being done very largely with facilities at Arlington Farm, where accurate control of temperature in storage rooms is now possible. It involves the maintenance and operation of the experimental storage plant. It covers the

whole question of the study of the effects of temperature upon vegetables to be stored for varying lengths of time—potatoes, celery, lettuce, and cabbage—the important staple vegetable crops.

The second item (on page 98 you will find it) is for Irish potato investigation, which is one of the most important vegetable projects, as this is our most important vegetable crop. It includes the improvement of Irish potato varieties, and especially under this increase it is desired to undertake farm practice studies in the production of potatoes, which have not yet been attacked.

The CHAIRMAN. What do you mean by farm practice studies?

Dr. TAYLOR. The determination of the best cultural practices in the important commercial potato producing regions of the country. They differ very greatly, depending upon the purpose for which the potatoes are grown, whether they dig them early, as in the South and in the Norfolk region, or for late crops and storage, as in Maine and Minnesota, Idaho, and Colorado; whether under a humid climatic agriculture or under irrigation agriculture, or on land reclaimed by drainage, as is California.

Under (c) \$5,000 for truck crop improvement. This applies to the existing project, which involves primarily the breeding of improved varieties of vegetables, of which we have considerable work under way but for which the increased cost of carrying on the work requires an enlargement of the fund.

The fourth item, \$5,000 for bulb-culture work, is to enable us to carry forward with full efficiency the very important bulb-culture work that is under way. If we are to reduce to a minimum the risk of the introduction of plant diseases from foreign countries, we must expect to provide our own supplies of these things, for which we now rely mainly upon foreign countries.

Mr. LEE. Holland, especially?

Dr. TAYLOR. Holland, especially. This work is well started. It has reached a stage where we are confident that large commercial results can be obtained from it.

Mr. CANDLER. We then can furnish our own bulbs, and not have to resort to importing them?

Dr. TAYLOR. Yes, sir. We can see the practical certainty of that possibility now with respect to narcissus and tulip. Hyacinths are rather further along and more difficult, but we believe it can be done and that the time is ripe for vigorous attack upon that problem.

Mr. CANDLER. We have been getting them heretofore from Holland?

Dr. TAYLOR. Largely from Holland, but to some extent from Belgium and England.

Mr. LEE. The few bulbs that we distributed this year, were they foreign?

Dr. TAYLOR. The congressional distribution this year of narcissus and tulip was, I believe, entirely from our bulb garden at Bellingham, Wash., which is the basis of this work.

The CHAIRMAN. The largest part of the bulb work is to be carried on at Bellingham, Wash.?

Dr. TAYLOR. Yes, at Bellingham. Some work is needed also somewhere in the Middle Atlantic region.

The CHAIRMAN. Some are grown in California and some in Washington?

Dr. TAYLOR. A little in California.

The CHAIRMAN. Have you farms there?

Dr. TAYLOR. No. In California we are cooperating merely with growers who are experimenting on their own account.

The CHAIRMAN. What are you doing at Bellingham?

Dr. TAYLOR. At Bellingham we have a piece of land, a plant-introduction garden, which we are asking you to authorize the Government to accept as a gift in order to get the title.

The CHAIRMAN. That has never been accepted. The matter was brought up two or three years ago. You have no authority to accept it?

Dr. TAYLOR. No, sir.

Mr. ANDERSON. When it was brought up before, as I recall it, there was some sort of a string attached to it.

Dr. TAYLOR. You were of the opinion, Mr. Anderson, that we could not accept it legally. I was of the opinion that we could, and I based that upon a ruling of a former Attorney General under which we had operated for a number of years; we put it up again to the Department of Justice, and they supported you and turned us down.

Mr. ANDERSON. I knew there was something about it that stuck in my mind, but just what it was I could not remember, but my impression was that there was some condition attached to it at the time.

Mr. CANDLER. They state now that the department is assured that they will give the land to them without any strings.

Dr. TAYLOR. The whole question of titles is being worked out now.

Mr. CANDLER. At Bellingham you have 60 acres?

Dr. TAYLOR. Yes, sir. We will reach that in a few moments in the plant-introducing paragraph.

Item 105, page 99, is a new item.

The CHAIRMAN. That is for "investigating methods of propagating fruit trees, ornamental and other plants, the study of stocks used in propagating such plants, methods of growing stocks," etc.

Dr. TAYLOR. The special point of this is the development in this country of a home supply of those nursery stocks, both fruit and ornamental, which we have heretofore imported from Europe very largely, such imports have been a continual source of introduction of disease, which it has been found necessary to quarantine against to a considerable extent, so that the country as it stands is at the parting of the ways. Either we must produce our own nursery stock or go without, or relax our care with respect to these diseases. We believe this is the practical way.

Mr. CANDLER. Under present restrictions, they do not like to ship the material over here and then have it sent back?

Dr. TAYLOR. Certain things they can not ship, certain things that are considered dangerous; certain others can be imported under restrictions, which is awkward and disagreeable for them to meet in many instances, but we are convinced that we can produce the apple, pear, plum, and cherry seedlings that we are importing by the millions from Europe and that we can produce the stocks upon which our nursery industry rests generally. The nursery industry of the country appealed to the department to undertake this work, and we have given it thorough consideration and believe it should be done.

Mr. ANDERSON. It is almost absolutely necessary that it should be done if you are to maintain your present restrictions, is it not?

Dr. TAYLOR. I think so; and the restrictions, as they stand, are conservative and necessary. The appropriations like those for citrus canker and blister rust, which you gentlemen have had to make, are the result of unrestricted importation of that class of material.

Mr. CANDLER. So, really, the prosperity of our nursery stock in the future depends absolutely on something of that kind being done, then?

Dr. TAYLOR. Yes, sir.

Mr. LEE. It ought to be done anyway.

Mr. CANDLER. We ought to produce our own trees and not have to haul them clear across the waters.

Mr. ANDERSON. May I ask you, Dr. Taylor, how extensively are nursery stocks of this sort now propagated in private nurseries in this country?

Dr. TAYLOR. Considerable quantities of apple seedlings are grown, chiefly in Kansas, mainly from imported seeds. Very small quantities of pear seedlings are grown, practically entirely from imported seed. Some Mazzard and Mahalet cherry seedlings are grown, but by far the larger part of the quantity required by our nurserymen is imported in the form of seedling stocks.

Mr. ANDERSON. Is it not profitable to nurserymen to grow these stocks, or whatever you call them, or have they not the requisite knowledge or the information about them?

Dr. TAYLOR. No one yet knows just how to do it with certainty. In some years an excellent quality of apple seedings results in others an inferior quality. The industry has been a comparatively closed one in western Europe for the rest of the world, and we think the time has come to change that situation.

Mr. ANDERSON. I am just wondering whether it was a matter of being commercially unprofitable or simply a matter of lack of information and experience.

Dr. TAYLOR. In the past there has not been so much incentive because the stocks have come in at low prices. The present prices are up to eight to ten times the prewar normal, and the disorganization of the industry in Europe by the war is such that it can not be expected to get back to prewar normal in Europe for a number of years.

The CHAIRMAN. When they return to normal conditions, then what?

Dr. TAYLOR. We believe we can grow these as well and as cheaply here as they can.

The CHAIRMAN. The nurserymen claim that they could be bought for less than they could be produced.

Dr. TAYLOR. That was true in the prewar time.

Mr. RUBEY. We have in Missouri a fruit experimental station located in my district. I do not know just the character of the work there, how much and how good work it is. Then we have a number of large nurseries in Missouri, and I know that they have developed some splendid apples. You take the Stark's Delicious that you can buy down here on the street. It is the best apple you can buy in Washington.

Mr. LEE. Two for a quarter.

Mr. RUBEY. Ten cents apiece and in some instances two for a quarter. I know they are doing a whole lot of good work in this investigation in Missouri.

Dr. TAYLOR. Our nurserymen are growing fine fruit trees, but they are growing them on stocks that were sprouted in France.

Mr. RUBEY. This Stark's Delicious was budded up and the apple produced out in Missouri.

Dr. TAYLOR. The original tree was from Iowa, but Stark got hold of it and proved it up and disseminated it in a very effective way, and it has become an important commercial variety.

Mr. RUBEY. It is so good that I want to hold it for Missouri if I can, you know.

Dr. TAYLOR. It has succeeded.

The CHAIRMAN. I have a communication from Congressman Gould of New York, relating to this item, which, without objection, will be inserted in the record. The committee has granted Mr. Gould a hearing on his bill—or in connection with this item—at a later date. There are a number of other communications on this item which are before the committee for its consideration.

(The letter referred to follows:)

HOUSE OF REPRESENTATIVES,
Washington, D. C., December 12, 1919.

HON. GILBERT N. HAUGEN,

Committee on Agriculture, House of Representatives,

Washington, D. C.

MY DEAR MR. HAUGEN: Referring to your letter of December 4, in re H. R. 5939, introduced by me providing for the experimenting of nursery stock, I would respectfully call to your attention the item which appears on page 241 of the annual Book of Estimates for the fiscal year ending June 30, 1921 (H. Doc. No. 411, 2d sess, 66th Cong.), under the heading Bureau of Plant Industry, Department of Agriculture, reading as follows:

"For investigating methods of propagating fruit trees, ornamental and other plants, the study of stocks used in propagating such plants, methods of growing stocks, the establishment and maintenance of mother orchards or plantations for the purpose of providing American sources of stocks, cuttings, or other propagating materials, \$30,000."

This item is for carrying out the same provisions as are included in H. R. 5939, and, as this matter is of vital importance to the country, and especially those interested in the nursery business, I hope that the Committee on Agriculture can see its way clear to adopting the recommendation of the department.

Yours, very truly,

N. J. GOULD.

(Statements made on this item on January 7 and 8 are inserted at this point.)

The CHAIRMAN. We will be pleased to hear you in reference to item No. 105, Mr. Watson.

STATEMENT OF MR. JOHN WATSON, OF PRINCETON, N. J., SECRETARY OF THE AMERICAN ASSOCIATION OF NURSERYMEN.

Mr. WATSON. Mr. Chairman, I am secretary of the same association of which Mr. Moon is president, the American Association of Nurserymen, and I want to say just a few words to you about paragraph 105, on page 99. That relates to an appropriation of \$30,000 for investigating fruit-tree seedlings and ornamental stocks, with a view to seeing whether we can produce in this country, in sufficient quantity, a suitable quality of things for which we have heretofore depended on Europe and other parts of the world.

If I take up your time telling you about things with which you are already familiar, I will be glad if you will just interrupt me; but

the nursery business secures its raw material, as you may know, from different parts of the world. For example, the greater part of the fruit-tree seedlings have always been imported from France. And when I say they come from France, I do not wish you to understand that they come from all parts of France. There are very limited areas in France which grow particularly good seedlings. Those areas are almost all located in the Loire River Valley, and especially around Angers and Orleans, and they have stocks that have peculiarities of their own in the quality of those fruit-tree seedlings. For example, Ussy grows some very good Mahaleb cherry seedlings, but the very best apple and pear seedlings grown in the world come from Angers and from a very limited area around there. The same is true of ornamental stocks. For example, our azaleas, formerly imported from Belgium, came from near Ghent and they were grown there in very small areas at Mierelbeke and Loochristy, just east and southeast of Ghent. It seems that every plant finds, in some part of the world, the peculiarly favorable conditions that make it grow better there than anywhere else.

Now, effective in June of last year, Order No. 37, to which Mr. Moon has referred, was put into effect. That was made necessary on account of the insects and pests and plant diseases which we had acquired along with imported plant material and in other ways from abroad. That quarantine was limited to the ornamentals. Practically all of the ornamentals were excluded, but fruit-tree seedlings are still permitted entry. Unfortunately, that does not help us very much. It is true that just now the supplies of fruit-tree seedlings in France are very limited, due to the war conditions. At the same time we nurserymen in this country, who are perfectly willing to buy those fruit-tree seedlings, find ourselves up against this very practical difficulty: That the foreign nurserymen tell us since we will not permit them to sell us ornamentals, they will not permit us to buy their fruit-tree seedlings, which they know we need far more than we need ornamental stocks.

That statement has been challenged, but the facts remain as they are. Last September there was an international horticultural trade conference held in Paris, where the French, Belgians, English, and the Hollanders met, and, among other things, they considered this prohibition order of ours shutting out their ornamentals but permitting them to ship fruit-tree seedlings. While no formal action, as far as we nurserymen can hear, was taken at that conference, and while it was not referred to in the published reports except in a very general way, still we feel the effect of something—not because all of the French and English nurserymen are in a combination that they refuse us their fruit-tree seedlings (I could not say that, because it is not within my knowledge)—but it is within my knowledge that some of the French nurserymen have, at least in writing to their customers here, refused to sell fruit-tree seedlings which we know they have, and we also know the nurserymen in England, New Zealand, and Australia have been able to buy the seedlings they have, and what we can not buy.

Now, we have grown a good many fruit-tree seedlings in this country, particularly in Kansas, in the Kaw Valley, near Topeka; particularly at Silver Lake and Rossville. Following the same rules that

apply in France, these areas are very limited. And while we have grown a good many apple seedlings, I think any practical nurseryman, especially in this part of the country, or outside of the extreme south and the extreme west, will say they can not compare in quality with the apple seedlings we have imported from France in the past. The French apple seedlings and French pear seedlings give better results in the nursery, and orchardists of age and long experience say they produce more productive and longer-lived trees in the orchard.

Now we have this difficulty with regard to our apple seedlings, that while it is possible we may, with fairly satisfactory results, get along with the same quality of seedlings that we have grown in this country in the past, yet we are dependent, as this paragraph says, on foreign countries for pear seedlings. We grow some pear seedlings in this country. They are all Japanese pear seedlings. They are suitable only for a certain class of pear trees, such as the Keiffer, Garber, and other hybrids, but are not suitable for budding with the Bartlett, Seckel, Clapp's Favorite, and the class we call French pears.

And while we grow apple seedlings in this country, yet we have to import the apple seed. There is some seed gathered in Vermont from the cider mills there, but it is not satisfactory; it does not give satisfactory results. We have imported the French crab-apple seed; and the cherry and plum seeds we have largely imported from France, and they have come from northern Italy and parts of the former Austrian Empire. Our seedling supply, then, is dependent on foreign seeds, and foreign seeds are subject to control of the same people who have been and are able now on the other side to control the seedling market. So it is necessary for us to grow our own seedlings in this country, and it is necessary also for us to grow mother orchards to supply the fruit from which we will get the seeds.

This is a small amount, and you may ask, "Well, why don't the nurserymen, with this market, in which they have now a monopoly—why don't they grow these seedlings themselves, without asking for Federal aid?" But it is a business that is highly technical. The expense is very great, the returns are uncertain, and it is not a safe thing to depend upon nor reasonable to ask the nurserymen to do. In almost anything else, if there is a great demand for something, a manufacturer may get out and invent something, and he makes it and sells it; but there are no such things as patents or protected trade-marks in the nursery business. The nurseryman might succeed after many years in producing some new strains of seedlings that would be very good and would be very profitable, but he could not get anything like an adequate return on his investment, and it seems very natural, it is something for which the nursery trade has to depend on the department. It is true our association represents only 400 nurserymen, but it represents a majority of the acreage and a majority of the turnover in the industry, and, as far as this item is concerned, what it purposes doing is not so much in the interest of the nursery business—because as far as that is concerned we can grow something else; we can grow coleus, geraniums, and tomato plants—but it is the future of American orchards; it is an item of food and a healthful food. It is of far more interest to the orchard-

ists of the country and to the consumers of fruit than it is to the nurserymen.

Now, that is a short general statement of what I consider the situation and the need for this, and I shall be very glad to answer any questions you have to ask me.

The CHAIRMAN. You are asking for \$30,000 for this work?

Mr. HARRISON. Yes, sir.

Mr. McLAUGHLIN of Michigan. You have told of the need and desirability of it. Can you give us some idea of how you think it would be carried on?

Mr. WATSON. I think the representatives of the Department of Agriculture can answer that better than I can. The item makes it available to the Department of Agriculture. The department, in a very small way, some years ago began experiments. Dr. Taylor, for example, has some very interesting pear seedlings that appear to be entirely different from anything we have seen before.

Mr. JONES. Has this request been made before, within your knowledge?

Mr. WATSON. No; it never has, because the importance of it has never been so urgent or immediate before.

Mr. McLAUGHLIN of Michigan. This item provides:

For investigating methods of propagating fruit trees, ornamental and other plants, the study of stock used in propagating such plants, methods of growing stocks, the establishment and maintenance of mother orchards or plantations for the purpose of providing American sources of stocks.

And so forth. Do you understand that it would be, or the course that would naturally be followed would be, that the department would acquire land for a lot of orchards throughout the country, in different climates and having different characters of soil, etc., to carry on these experiments?

Mr. WATSON. Not extensively, with the idea of producing seedlings or stocks in great quantity. Certainly not orchards for producing the fruit; but sufficient to carry out these tests to produce a stock from which a start can be made in growing stocks, say, apple stocks, from layers or orchards of seedlings to produce seeds.

Mr. McLAUGHLIN of Michigan. Are you right about that? This says for the establishment and maintenance of mother orchards or plantations for the purpose of providing American sources of stock. Now, it is not an experiment; it is not for the purpose of trying out these things and establishing the facts; it is for the purpose of supplying and providing the American sources of stock.

Mr. HARRISON. Would you rather have Dr. Taylor or Prof. Corbett, who will direct the work, tell you just what they propose to do and what the item means? They are here.

Mr. McLAUGHLIN of Michigan. I expect this gentleman can tell me what they expect to be done.

Mr. JONES. He does not represent the Government.

Mr. McLAUGHLIN of Michigan. I do not care who does it.

Mr. RUBEY. What are the States doing in their fruit experimental stations along these lines? We have in a number of States fruit experiment stations. I have one in my State, in my district. They have over 100 acres. And it has occurred to me that they ought to be doing this kind of work.

Mr. WATSON. I can not speak of that.

Mr. RUBEY. Probably Dr. Taylor can tell us, or some member of the department. I thought you might know.

Mr. WATSON. The States have been largely interested in varieties of fruits. We have been so sure of a continuance of these foreign sources of supply of seedlings that to date very little has been done in the way of producing seedlings over here; but I am sure all that has been done has been done in the department here in Washington and very largely under Dr. Taylor's direction, and particularly with regard to these pear seedlings that I mentioned.

The CHAIRMAN. Thank you, Mr. Watson. We will hear Dr. Taylor in reference to this item, now.

FURTHER STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. TAYLOR. Mr. Chairman, you may recall there was a brief discussion of this item at the Bureau of Plant Industry hearing, and at the risk of repeating some of the matter already in the transcript there I will say specifically, in response to Mr. McLaughlin's question, that this need probably will arise, namely, that of assisting nurserymen and fruit growers in establishing orchards for the production of seeds, as distinguished from fruit for eating—seed suitable for the production of these stocks. For some of these orchards it is contemplated suitable conditions will be found in areas of unforested land in certain of the eastern forest reservations; for example, where plots can be established to produce steady supplies of seeds suitable for the production of these stocks. That is merely one incident in the mother-orchard feature.

I may say at the present time one almost untested Oriental pear species, which is promising as a stock, is being established in orchard form by a New York nursery, with a view to producing a supply of seed for the use of that nursery in the growing of pear stock of the Oriental types.

Now, this whole question, while the acute exigency is a joint result of the war and the quarantine which has been described by Mr. Watson, is considerably broader in its ultimate effect on the American orchard industry than has been indicated. As a matter of fact, we do not know as pomologists, as fruit growers, any more than the nurserymen do, that we have in use the stocks which are best adapted to the important orchard districts in this country. We are growing orchards under a tremendously wide range of soil and climatic conditions. We do know these French apple seedling stocks are not safe for the extreme north and portions of the Great Plains. We do know that in Minnesota and in the Dakotas it is necessary to get a hardier apple stock, because the trees kill out in a hard winter, perhaps after they have stood and grown thriftily for 8, 10, or 15 years. We do know in the case of the pear there are differences of congeniality between the standard fruiting varieties like the Bartlett, Seckel, and other high-quality standard sorts, and the European and Oriental types of seedlings which so far are in use in the nurseries.

The item proposes an experimental attack upon the fundamentals of this question of the adaptability of these stocks, with resulting

constructive assistance to the nursery and orchard industry in the production of home-grown stocks for the future. Part of the exigency to which Mr. Watson has referred, with respect to the sources of supply of seed and of stocks from the European continent, at present is due to a very light crop of fruit in the cider apple and pear orchards of western Europe in 1917.

While investigating the agricultural conditions there in September of 1917, we found hardly a hatful of fruit on the trees of those orchards which are relied on to produce the bulk of the seed for growing these seedlings. A year of shortage like that is as likely to occur during a time of peace as it is during a time of war, and our industry ought not to be subjected to a foreign-crop failure of that kind in the future. It will pinch our fruit growers this year, because there is no way of procuring substitutes for these that are satisfactory or of replacing that seed and those stocks immediately. But the proposal is, gentlemen, that we protect our country in so far as the risk of the introduction of these destructive and expensive tree and plant diseases are concerned, like the chestnut blight, the white-pine blister rust, and the citrus canker, all of which have come in on nursery stock at one time or another and on which we have spent hundreds of thousands of dollars in combating, and to now protect our country against the possibility of such introductions in the future, not merely by excluding the nursery stock which has brought them heretofore, but by assisting our nurserymen and fruit growers in developing a home supply, so it will not be necessary to take any unreasonable chances of the introduction of such diseases. I believe it can be done.

Mr. McLAUGHLIN of Michigan. I asked a question about the meaning of this section 105. It is one thing to cooperate with the nurserymen and to make investigations; it is another thing to establish and maintain mother orchards for the purpose of providing American sources of stock. That may be a permanent proposition involving the purchase of land, the planting of orchards, and the caring for them and carrying on all the business in connection with the producing of the seeds, cuttings, etc.

Dr. TAYLOR. I would say that what is in the mind of the department with regard to the work to be done under this language, Mr. McLaughlin, does not involve the purchase of land or the establishing of orchards other than possibly small orchards on Government-owned lands, such as in the eastern forest reserves, where there may be land suitable and merely requiring the planting under favorable fruiting conditions; because the thing which will be essential in this provision of seed will be regularity of production, and no purchase of land or the establishing of Government-owned orchards, other than might be incidental to the plant production gardens already established or suitable places that could be found on the forest reserves, is contemplated.

Mr. ANDERSON. It strikes me that one of the things to be avoided here is the establishment of a sort of governmental agency on which everybody is going to depend for certain fundamental seed stocks. If the Government is going to undertake this proposition and gives everybody to understand it is going to do it, we very soon will find ourselves in the position of a worse shortage than we have now.

Dr. TAYLOR. That is not at all in the mind of the department workers who have the matter in hand. What probably will result will be this: As in the case I have already cited, as soon as a variety or strain is demonstrated to be suitable, to fit the climatic and soil requirements of an important orchard region, speaking of fruit-tree stocks, commercial concerns will take hold and provide their own supply in order to have it just as this New York concern is now doing with this recently introduced oriental pear stock. It would, I think, be entirely out of the question (so far as my personal opinion is concerned, it would be inadvisable) for the Government to undertake to provide these supplies required by the nurserymen; and I do not think the nurserymen would welcome that, knowing what their competitive feeling is with respect to each other.

Mr. McLAUGHLIN of Michigan. It was inadvisable to draft the section as it is drafted, was it not, because it would permit that and directly call for it?

Dr. TAYLOR. It is possible this wording might be construed as we have not construed it, as a source of commercial supply, but that was not our intention.

Mr. McLAUGHLIN of Michigan. This says:

The establishment and maintenance of mother orchards or plantations for the purpose of providing American sources of stocks.

Dr. TAYLOR. As I have stated, what we had in mind there was these small nuclei of production.

Mr. TINCHER. Doctor, as I understand you, with this \$30,000 appropriated, there would be six new officers created as enumerated at the bottom of page 99.

Dr. TAYLOR. The estimate is that there will be six people required.

Mr. TINCHER. That will be six new men going to work for the Government.

Dr. TAYLOR. Yes, sir.

Mr. TINCHER. Then the size of this appropriation for next year would depend upon the efficiency of these men, and like any Government investigating branch that would probably grow according to their efficiency in their lines; is that right?

Dr. TAYLOR. Subject to determination by Congress.

Mr. TINCHER. And we may reasonably expect if the propagators are up to snuff that by 1925 we will be called upon for \$500,000 on this item if history repeats itself with reference to other items in this department.

Dr. TAYLOR. Certainly not, unless the results of the work shall so convince you gentlemen that you feel compelled to appropriate that amount of money for it.

Mr. ANDERSON. This is spoken of as an emergency proposition, yet I predict that it is not the meaning of the department that it is an emergency proposition in the sense of being temporary.

Dr. TAYLOR. No, sir. The emergency feature of this is the parting of the ways which we face, as Mr. Watson has indicated, with respect to our supplies of propagating stocks.

Mr. ANDERSON. It would be in contemplation by the department, I take it, that if the amount which is now suggested is going to be anything like adequate when the proposition is developed, I assume that you are going to proceed rather slowly. You will be-

gin, probably, only investigational lines. You will not need very many men on that?

Dr. TAYLOR. Yes, sir.

Mr. ANDERSON. But if you ever take up this proposition of establishing those nuclei, as you call them, the proposition is going to be very much, very much larger than it is indicated by the amount now?

Dr. TAYLOR. Not necessarily, I think, Mr. Anderson. It would not be in our minds that that would be true. I do not understand that the nursery trade would be inclined to leave to the Government the production and, therefore, the control of these essential materials after the way is blazed out so that they know how to proceed.

Mr. ANDERSON. I think the committee are really entitled to a fairly reasonable prospect of what it is going to be expected to do in the future in a new item of this sort. I do not think it is quite fair to the committee to start out with an appropriation of \$30,000 if it is reasonably contemplated that that item is going to be very much enlarged without telling us so.

Dr. TAYLOR. I do not think it is. I have no reason to expect that this item would develop commercial features or develop a large expenditure any more than the fairly comparable items in the Bureau of Plant Industry with respect to lines of crop work, except in cases where control of epidemics has become necessary.

Mr. ANDERSON. You are going to establish a number of orchards. In our experience that means buildings for the equipment, buildings for the animals, buildings for the employees, buildings for the superintendent, and everything of that sort. That has been the history of the establishment of these things from the very beginning. If that is what is going to be done in the future, we want to know it. So far as I am concerned, if I thought this was a good proposition, I would not be deterred by the amount of money necessary to do it. I want to know in advance, if I may, what we are going to be expected to do if we start this thing.

Dr. TAYLOR. Possibly the reference to orchards has given it an aspect of magnitude which is undue. Such orchards or plantations would consist merely of trees planted and given the ordinary cultural treatment, including harvesting the crop and not requiring continuous experimentation, such as we do find necessary in plot work. That work would be done, part of it, at Arlington Farm, part of it at the garden at Chico, Calif., already established and already equipped with buildings under conditions suitable.

Mr. ANDERSON. I understand that part of it.

Dr. TAYLOR. We do not contemplate the establishing of separate stations involving the erection of buildings or the purchase of land in connection with this work.

Mr. ANDERSON. You do not contemplate it, but you ought to, if I have a correct view of the proposition in my own mind. As I understand, what you propose to do is after you have experimentally established the value of the stock you propose to go ahead and grow that in sufficient quantity, at least, and furnish it to a considerable number of the nurserymen over the country for propagation by them.

Dr. TAYLOR. Yes; to give them a start.

Mr. ANDERSON. That is not a very small undertaking, considering the magnitude of the industry and variety of conditions under which this stuff must be grown. Consequently, I take it that these orchards which you are going to establish out in the various reserves somewhere will not be so small but that they will have to have men working out there, and our experience has been when you put men out in the forest reserves they can not live in tents. They have to be housed and everything of that sort. I do not believe you could properly start a proposition of this kind and carry it out with any such appropriation as you propose here in the beginning of it, that you will get anywhere on the major plan.

Dr. TAYLOR. It is our judgment that we can.

Mr. ANDERSON. Your judgment is probably better than mine.

Dr. TAYLOR. It is our expectation that we will if this appropriation is available.

Mr. ANDERSON. I am willing to say this much, that I think your bureau gets about as much done with its little money as any of them.

Dr. TAYLOR. Thank you, sir. We endeavor to get full value for every cent that we spend on the public work.

Mr. McLAUGHLIN of Nebraska. I am like Mr. Anderson, Dr. Taylor; I hesitate to even make a suggestion to you as to how you should carry on your work, but it occurred to me that if you take these forest areas and cultivate them and grow these trees and different kinds of stock and those places may be found suitable localities for growing it, unless the Government goes into those places on a large scale, it will be necessary for the private interests to acquire similar lands and to do their work under similar conditions. Why would it not be better to cooperate with the nurseries already established and to assist and advise them in this kind of work where their plants are located and their locations may be found suitable under such methods as you would find proper and then they could do their own work on their own plants, and not be dependent upon the Government nor would it be necessary for them to acquire great areas away off in that far western country to carry on their work.

Dr. TAYLOR. That goes without saying in our minds, Mr. McLaughlin, that there will be cooperation, as there is now, with every feature that we have under way that touches this problem at all. We must probably face this situation, that many of the nurseries are located in territory which is not good fruit-growing territory. It is excellent propagating territory but not good orchard territory, so that in so far as seed supply is concerned any plan for the future must rest on certainty of annual production of crops of seed. That is one incident in this. Just as soon, for example, as a stock in our tests develops promise, our idea is to place that with the nurserymen for commercial test and just as quickly as it is demonstrated that it is commercially practicable turn it loose, and we feel that they will take care of it. We do not anticipate that this is going to develop any great paternalistic activity which will do things for the nurserymen which they properly should do for themselves, but that it shall, in the interests of the fruit industry and of the general public in its use of ornamentals point the way which the commercial interests can safely follow.

Mr. McLAUGHLIN of Michigan. Suppose it is developed in these areas that you select that the work can be profitably carried on. The

nurserymen, however, each one having his own plant, would not acquire property out there and go into business out there until he was satisfied that his own location was unsuitable. He would want to have it determined that his own property was not suitable before he would give up his location or acquire property elsewhere for that purpose. Is that true?

Dr. TAYLOR. In general, he knows whether apples, for example, are a regular crop where his nursery is. Many of the best nurseries are located where apples do not bear regularly because of untimely spring frosts, yet the growing season conditions and soil are admirably suited to the growth of nursery stock. Of course, it is a very complicated question—one of the most complicated in plant production—because it involves very intensive horticultural activity and involves heavy expenditures per acre of land.

Mr. JONES. This is a new item.

Dr. TAYLOR. Yes, sir.

Mr. JONES. Has the department ever made request for this before?

Dr. TAYLOR. No, sir.

Mr. JONES. What condition has arisen that justifies it at this particular time under stress of these times when no new appropriations are to be made?

Dr. TAYLOR. A realization of this fact, that so long as we rely upon the bringing in of nursery material from foreign countries we risk the bringing in of destructive plant diseases.

Mr. JONES. But you brought them in last year, did you not?

Dr. TAYLOR. No, sir. Diseases have come in in the past that we are now fighting. Congress authorized quarantines against such stock as is likely to bring disease.

Mr. JONES. Yes; I appreciate that.

Dr. TAYLOR. On which the quarantine was laid and is in effect.

Mr. JONES. Is there any other appropriation so these things would be taken care of?

Dr. TAYLOR. No, sir; not under the investigational items having to do with this feature. It is a new item; it is a constructive forward-looking item brought forward now because we face this particular emergency and we feel it should be dealt with squarely and effectively.

Mr. RUBEX. Are the State experimental stations doing anything along this line?

Dr. TAYLOR. The State of California is doing some work on stocks for citrus fruits which they have in recent years found to be a very important thing that has been neglected. No other State, so far as I know, is at work upon it.

Mr. RUBEX. Is it not possible for the States to make these experimental stations and do this work?

Dr. TAYLOR. Of course, quite a little of this can be done in co-operation with those stations, but no State has a sufficient nursery investment or a sufficient degree of control to encourage it to go forward. That seems to be the reason.

Mr. RUBEX. Do you know how many fruit experimental stations are maintained by the respective States?

Dr. TAYLOR. Distinctly as fruit experimental stations, I think only Missouri and California, though several of the States have substations for work upon fruit along with other things in which fruit work is incidental.

The CHAIRMAN. Are there any other questions? Doctor, we are very much obliged to you.

THURSDAY, JANUARY 8, 1920.

The CHAIRMAN. We have with us this morning Congressman Gould, who desires to address the committee on H. R. 5939, introduced by him, which is similar to item 105, which we have considered. We will be glad to hear from you, Mr. Gould.

STATEMENT OF HON. N. J. GOULD, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK.

Mr. GOULD. Mr. Chairman and members of the committee, I want to take a few minutes of your time in connection with the item on page 241 of the annual Book of Estimates, \$30,000, which covers a request for an appropriation along the lines of a bill which I introduced recently, H. R. 5939.

I would like to file with the committee a letter from the Secretary of Agriculture in regard to the need for the appropriation, which would enable the department to start the work of propagating seeds, and it would seem as if it would be probably better if the committee does not decide to include the item in the appropriation bill, but might rather be inclined to give consideration to the bill itself, to change the title to read as follows:

To provide for the investigation of stocks for use in propagating fruit, nut, and ornamental trees and other plants, and the development of methods of producing and handling such stocks.

With the permission of the chairman, I would like to file with the committee and put in the record this letter from the Secretary of Agriculture.

The CHAIRMAN. Without objection, it will be so ordered.
(The letter referred to follows:)

DEPARTMENT OF AGRICULTURE,
Washington, August 2, 1919.

HON. NORMAN J. GOULD,
House of Representatives.

DEAR MR. GOULD: In accordance with your request, the department has given very careful consideration to the bill H. R. 5939, providing for experimental investigations relating to the stocks upon which to propagate fruit, nut, and ornamental trees, and other plants.

The importance to the nursery and fruit industries of this country of the investigations proposed by the bill can hardly be overestimated. The foundation of our apple, pear, peach, plum, cherry, citrus, and other fruit industries is the stocks on which the trees are budded or grafted. These stocks are, in large part, seedlings grown from seeds obtained from various sources. In case of the apple, pear, cherry, and in part the plum, the sources of seed supply are almost entirely in foreign countries, particularly those of continental Europe and the Orient. While stocks of all these kinds are grown to some extent in this country, they are produced largely from imported seeds, there being no suitable and adequate sources of supply of such seeds in the United States. Furthermore, large quantities of seedling stocks, in addition to those

grown in this country from imported seeds, are imported. More than 20,000,000 apple stocks alone, as well as many other kinds, were imported in 1916 before the trade was seriously interrupted by war conditions. In the case of citrus stocks, peaches, some plums, and other kinds, there are domestic sources of seeds which are fairly adequate to our present needs.

In view of the danger of a failure of supply through interference with production in foreign countries, such as recently has been experienced, the necessity of developing domestic sources has become very clearly apparent during the past two years.

Still more important at the present time is the determination, through experimentation and study, of the kinds of stocks best adapted to the different climatic, soil, and other environmental conditions in which our tree fruits are being planted. While such fruits as the apple, peach, pear, plum, and cherry are grown under widely varying conditions, and require very careful selection of varieties for fruiting, our nurserymen, with comparatively few exceptions, are propagating these trees on single kinds of stocks, because these can be secured, without reference to their actual adaptability to different parts of the country. This situation with respect to the durability of our orchards is due to the lack of available information regarding the stock requirements of the different regions.

In the case of the apple, the fact that the French crab stock is well adapted to European conditions, and fairly so to the soil and climatic conditions found in our Northeastern States, is not at all indicative that it is the best stock for propagating apple trees to be planted in the mountain regions of North Carolina and Georgia, in the Middle West, in the Great Plains, or on the Pacific coast. In fact, there is very strong indication that no single apple stock is suitable for planting throughout our important apple districts. As such orchards, when planted, are intended to endure for from 25 to 100 years or more, the question of the suitability of the stock is one of great importance to the farmer and to the commercial fruit grower. What is true of the apple is, to a considerable extent, true of most of the other tree fruits.

The necessity of restricting, under the Federal plant quarantine act, the importation of much of the nursery stock and other closely allied plant material brought into the United States in large quantities, in order to prevent the introduction of additional dangerous insect pests and fungous diseases which would be destructive to our orchard, forestry, and ornamental tree interests, gives added emphasis to this matter at the present time.

It is not to be presumed that, in the widely varied conditions both as to soil and climate obtaining in different parts of the country, there are not places where it will be possible to grow stocks having all the desirable qualities, from the standpoint of the nurseryman and the orchardist, of the stocks now imported. The determination of proper methods of culture and of handling the stocks may contribute as much to their quality and value as the conditions of the region in which they are grown. The problem involves, therefore, not only the determination of the regions where suitable conditions exist but also the development of methods of producing and handling stocks.

Some of the more conspicuous features of the fruit-tree stock problem may be summarized as follows:

1. To determine, through investigation, the best kinds of stocks for the different fruits when planted under different climatic, soil, and other conditions.
2. To determine the conditions, soil, climatic and other, best suited to the growing of such stocks.
3. To determine the best methods of growing and handling these stocks under American conditions.
4. To encourage the establishment and maintenance of mother orchards to serve as sources of domestic supply of fruit-tree stock seeds of the different kinds.

These problems are Nation-wide in their scope and do not admit of solution by individual nurserymen or fruit growers, nor can the individual States, working independently, accomplish the ends in view.

If this department is authorized to undertake such investigations as are outlined in H. R. 5939, it could undoubtedly, through its existing forces in the Bureau of Plant Industry, working in cooperation with the State experiment stations and individual farmers, fruit growers, and nurserymen, make rapid progress in the direction of safeguarding the stability of our orchard industry. The magnitude of the industry is, to some extent, indicated by the fact that the estimated value of the 1918 crops of apples, peaches, pears, and citrus fruits of

the United States was approximately \$280,000,000, not taking into account the value of the plum, prune, cherry, and other fruits. The conditions affecting the ornamental tree and plant industry are very similar to those of the fruit industry.

The sum of \$30,000 named in the bill would, if appropriated, make it possible for the department to undertake these lines of work, to which at present it can give only incidental attention.

It is suggested that the title of the bill would be more clearly indicative of its purpose if it were changed to read substantially as follows:

"To provide for the investigation of stocks for use in propagating fruit, nut, and ornamental trees and other plants, and the development of methods of producing and handling such stocks."

Very truly, yours,

D. F. HOUSTON. *Secretary.*

Mr. GOULD. In general, and to be brief, I might say that throughout the central part of New York State, as you gentlemen undoubtedly know, and in many other parts of the country, there are many concerns engaged in the raising of nursery stock. It developed during the war that our stock of seeds was very much depleted; and also the fact developed that a great percentage is imported from France and Belgium. For that reason we were tied up, and to-day the condition of the industry and of those who may want to plant and raise nursery stocks for sale to those who may wish to have the privilege of raising fruit, is very much restricted.

On consultation with the Department of Agriculture I found that in all probability it would not be a great undertaking, nor exceedingly expensive, if by use of some part of the forest reserve or other Government-owned land in various parts of the country, we might have a small appropriation to institute the work of finding what types of seed, and hardy fruit trees, would be best suited for various parts of our country, and in that way help in the production of fruit.

For that reason I introduced the bill, as I have stated, and also have prepared for the committee a partial list of men in various parts of the country, some of whom I have seen, and from all of whom I have letters on file; and I do not think it is quite necessary to cumber the records with all the correspondence I have, but I can say that these letters are all along the same lines, and advocate the benefit which would accrue to the nursery industry and to the fruit growers of the country if this work might be started.

The CHAIRMAN. Who are they; nursery men, or farmers?

Mr. GOULD. I suppose probably 80 per cent are nurserymen. Some are farmers. No, they are not 80 per cent of them nurserymen. I should imagine about half of them are nurserymen, and the balance are farmers who are engaged in raising fruits; and they cover in scope Illinois, Pennsylvania, Minnesota, West Virginia, Michigan, Maryland, Georgia, Iowa, Indiana, Oregon, California Tennessee, and Texas.

If the committee desires me to do so, I would be glad to read extracts from some of these letters, outlining the apparent need for the starting of this work. I have made one or two little notes here. I have here a letter, for instance, from Houston, Tex., from the Texas Nursery Co., in which they say as follows:

The importance of encouraging the development of that branch of horticulture which produces the best stocks for the different sections of our country is of incalculable value, greatly extending the production of one of the country's greatest needs not only in overcoming the high cost of living but in providing more abundantly the most wholesome and delicious articles of food.

I read from another letter (from Newark, N. Y.):

Unless we do get some help from the Agricultural Department very soon there is going to be a terrible dearth in the supply of a good many of the more staple kinds of nursery stock, both fruit and nut trees and ornamental trees and deciduous shrubs as well.

The rest of these letters, Mr. Chairman, are all practically along the same line. They support the contention which I make, that this country is to-day practically dependent upon the importation of seeds from abroad for fruit trees.

The CHAIRMAN. Can the growing of nursery stock from seed be made a success commercially in this country?

Mr. GOULD. I should think so.

The CHAIRMAN. To compete with other countries?

Mr. GOULD. I do not know.

The CHAIRMAN. We have never been able to compete with our foreign competitors before.

Mr. GOULD. As to that I am perfectly frank to say that I have not the personal knowledge; but I do know of many nursery concerns in my part of New York State which have been successful in their business, and from that I assume they can compete.

The CHAIRMAN. In growing nursery stock?

Mr. GOULD. Yes, sir. If the Chairman has no objection, I would like to file with the committee a few typical letters which I have here.

The CHAIRMAN. Any extracts which you have read from the letters will be included in the printed reports. Is there anything in addition to that?

Mr. GOULD. There are some parts that I did not give that might possibly be of interest to the committee.

The CHAIRMAN. The committee will be glad to have you file the letters with it. Thank you very much.

(A list of correspondents, together with extracts from certain letters submitted by Mr. Gould are here printed in the record, as follows:)

Swain Nelson, Glenview, Ill.
 J. Edward Moon, Morrisville, Pa.
 C. H. Perkins, Newark, N. Y.
 J. M. Pitkin, jr., Newark, N. Y.
 Wm. Pfaender, jr., Newulm, Minn.
 H. W. Miller, Paw Paw, W. Va.
 Chas. E. Greening, Monroe, Mich.
 Ralph T. Olcott, Rochester, N. Y.
 Theodore J. Smith, Geneva, N. Y.
 W. M. Scott, Hancock, Md.
 L. A. Berckmans, Augusta, Ga.
 W. M. Gould, Newark, N. Y.
 E. N. Sherman, Charles City, Iowa.
 J. L. Pelham, Leesburg, Va.
 W. C. Reed, Vincennes, Ind.
 W. M. Pitkin, Rochester, N. Y.
 Robt. Pyle, West Grove, Pa.
 Geo. T. Powell, Ghent, N. Y.
 J. B. Pilkington, Portlang, Oreg.
 C. S. Milliken, Los Angeles, Calif.
 Thos. A. McBeth, Springfield, Ohio.
 R. D. Underwood, Lake City, Minn.
 E. B. Drake, Winchester, Tenn.
 C. H. Andrews, Faribault, Minn.
 C. Sonderegger, Beatrice, Nebr.
 J. R. Barnes, Yalesville, Conn.

We are very glad, indeed, to know that such a bill is being presented, and sincerely hope that it will be passed. We take the position that since the Government will soon prohibit the importation of fruit-tree stocks, that it should stand the cost of experimenting and find some place where they can be grown as well as in France.

Without consulting them, which I have not yet had opportunity to do, I can not report the views of all the nurserymen who are members of this association, but I can not imagine any reason for any nurseryman opposing the bill. I can see very many reasons why every nurseryman should favor it. Order No. 37 of the Federal Horticultural Board prohibits the importation of the raw materials on which we have depended in the past, with the exception of fruit-tree seedlings and rose-stocks. The latter have been grown in this country for a good many years, but we have not been able to duplicate the favorable conditions of soil and climate which have enabled French growers to supply a quality that American nurserymen have been willing to import at prices higher than asked for American seedlings of the same kinds. If, as some nurserymen think, rose-stocks and fruit-tree seedlings will, after a time, be added to the list of things excluded, then it is of serious importance to the nursery and orchard interests of the country, that provisions be made for producing here raw materials of satisfactory quality. That undertaking will be necessarily largely experimental and expensive, and it is doubtful that it will be undertaken by private enterprises. It would seem to be no more than reasonable for the Government to undertake this work and to demonstrate ability to grow here the materials formerly imported and now excluded. I believe that the Federal Horticultural Board and the Bureau of Plant Industry will heartily support this bill.

* * * * *

Anyone familiar with all the circumstances and in touch with the situation will recognize the tremendous importance of this bill, not only to nurserymen but to the orchardists. During war years there were small supplies of seedlings grown in France, and importations were difficult and limited in quantity. We are just now beginning to feel the effect of that, when we have a marked shortage of fruit trees of all kinds and an enormous demand. Prices for all fruit trees are very high, but evidently there are very few to be had.

Even though there should be no further restrictions put upon importation, still the very fact that ornamentals are excluded, while fruit stocks can be imported, can not fail to have its effect upon the French growers, whose moderate supplies this season are going to their European allies instead of coming to this country. And while we grow seedlings, though not of the quality and value of those imported, yet we have to depend upon foreign countries for the seeds, and largely upon France. And it is significant to note that the crop of these is "not sufficient to spare any to American buyers." Only last month there was held in Paris an international horticultural conference, at which the American market was discussed, and while no formal action was taken to our disadvantage, we draw inevitable conclusions from the circumstances and facts known to us.

I shall be very glad of an opportunity to come to Washington at any time to talk with you about this bill and to give you any information that you may want.

FRIDAY, DECEMBER 12, 1919—AFTERNOON SESSION CONTINUED.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. Dr. Taylor, will you tell us about item 106, "for continuing the necessary improvements to establish and maintain a general experimental farm and agricultural station on the Arlington estate?"

Dr. TAYLOR. That is the appropriation under which we maintain our Arlington experiment farm in Virginia, just across the river. We

are asking for an increase here of \$5,000 to meet increased costs of maintenance due actually chiefly to the shrinkage of the dollar.

The CHAIRMAN. What about the next item?

Dr. TAYLOR. In item 107, page 101, "for investigations in foreign seed and plant introduction," we are asking for a total actual increase of \$31,500. We are asking for certain new language, which is shown in italics, which, in brief, would authorize the Secretary of Agriculture to acquire by gift, devise, or by purchase for a sum not to exceed \$1 for each site the sites now occupied by field stations at Chico, Calif., 80 acres; at Bellingham, Wash., 60 acres; at Buena Vista, Fla., and Savannah, Ga., 25 acres and 46 acres, respectively. All of them now, with the exception of Savannah, have for many years been in use as field stations for this work.

Mr. ANDERSON. You say you can run this 130 acres in Chico without increase in appropriation. How much is it going to take if you add this 80 acres?

Dr. TAYLOR. That is all included in this. There is no increase at all of the acreage; it is merely transfer of title.

Mr. ANDERSON. You had authority to buy 130 acres in 1918?

Dr. TAYLOR. Yes, sir. Historically it came about in this way: The work was authorized to be undertaken and was undertaken on the basis of land purchased by a group of citizens at Chico, who deeded it in trust to the director of the California Experiment Station. He leased it to the Department of Agriculture for 99 years, I think it was, for such use as this. It would be quite a long story to detail it all. That is the substance of it. Then upon our recommendation Congress a number of years later authorized the purchase of 130 acres additional. That land was purchased, but it has not yet been improved to the extent that it should be for fully effective use; so that we actually have in use all of this land the title to which it is proposed to acquire.

Mr. ANDERSON. That is, the 80 acres that you are talking about is included in the 130 acres?

Dr. TAYLOR. No; we own 130 acres, and it is proposed to acquire by gift of one dollar compensation the 80 acres which we hold under a 99-year lease.

Mr. ANDERSON. That is the 99-year lease that I said you did not have the authority to make.

Dr. TAYLOR. I did not remember that your opinion extended to the lease. I thought we were discussing the question of title.

The CHAIRMAN. How long will it take you to complete your statement, Doctor?

Dr. TAYLOR. I think half an hour more, Mr. Chairman. These acquisitions of title do not involve an expenditure of more than \$4.

Mr. ANDERSON. You have actually got the land but you have not got the title; is that the idea?

Dr. TAYLOR. Yes.

Mr. ANDERSON. Are there any buildings owned by the Government on this land?

Dr. TAYLOR. Yes; at the Chico station, gardens, buildings, and equipment.

Mr. ANDERSON. What is the condition of title on these other places?

Dr. TAYLOR. In the case of Bellingham, the holding, I think, is under a 99-year lease. It is under a long-term lease. The site at

Buena Vista is under a deed of trust to the director of the Florida Experiment Station for lease to the department and is under a long lease; I think 99 years.

The Savannah station of 25 acres is, I think, under a 99-year lease. It is a long lease, the title being held by a trustee, to whom the donor deeded it in order that it might be available for our work.

Mr. ANDERSON. There is no limitation upon that deed of trust at all?

Dr. TAYLOR. In the case of the Bellingham deed of trust, my recollection is that it is for the purpose of a plant-introduction garden. I do not recall the exact wording.

In the case of Chico, my recollection is that there is no limitation. In the other two my recollection is that there is no limitation.

Mr. ANDERSON. So far as I am concerned, I would not vote, if I knew it, for any proposition for the Government to take over and operate land which was subject to conditions. I would not vote for such a proposition if I knew it. Of course, if I did not know it, I suppose it would not hurt me any. There is every legal reason and political reason why the Government should not take property that is subject to conditions. If we can not enter this property under conditions which make it possible to use that in any way in which we think it is proper to use it, we ought not to have it; and, as I said before, I will not willingly vote one nickel for any proposition which involves the Government's taking title to land which is not absolutely subject to its control for any and every purpose.

Dr. TAYLOR. It is my impression that in most of these cases, at least, that condition can be met. I am not able to say that they can in every case, for the donors are in three of these cases in position to re deed without condition; as to the other case I am not clear.

The CHAIRMAN. Would such action result in the establishment of stations which we would be obliged to maintain at a large expense?

Dr. TAYLOR. It does not in any way change the status of these stations in so far as our improvement or use of them is concerned.

Mr. ANDERSON. It does to this extent, doesn't it, Doctor, that, having taken a lease or contract based upon the supposition of the continuance of the station, the moral obligation is there to maintain it for the period or term for which we took it?

Dr. TAYLOR. The 99 years covers that, in so far as we can look forward to it.

Mr. ANDERSON. Mr. Haugen is inquiring into the proposition of whether or not we are going to be tied up to a more or less continuous and almost perpetual expense for maintenance of these stations, whether we want to or not. If we have got them under a 99-year lease, or some lease, conditional upon our carrying on certain work out there, we are morally obligated, of course, to carry on that work during the period.

Dr. TAYLOR. Yes; that is true.

The CHAIRMAN. The question, then, is of policy; is it wise to embark upon this policy?

Dr. TAYLOR. In so far as the continuance of the work or its development or enlargement is concerned, I think it would be exactly as it is. Congress could at any time, if title rested here, without ethical or other breach, close up these stations and dispose of the lands in such way as might be deemed best at the time.

Mr. ANDERSON. Let me ask you this question. Perhaps I ought to ask it of the solicitor, but he is not here. You put these buildings on this property that you lease for 99 years. Who owns the buildings?

Dr. TAYLOR. We do.

Mr. ANDERSON. Suppose we abandon the project, would that still be true?

Dr. TAYLOR. Yes, sir; that is my understanding.

The CHAIRMAN. So far as Congress is concerned, it has not been accepted.

Dr. TAYLOR. No; this is a recommendation.

The CHAIRMAN. The 99-year lease is an arrangement between the department and the donors?

Dr. TAYLOR. Yes; that is an administrative matter.

We are asking for the omission of the language providing \$50,000 for the establishment of a plant detention station. An excellent site has been purchased for this purpose about 15 miles out of Washington.

The CHAIRMAN. How much did you pay for it?

Dr. TAYLOR. We paid \$10,000 for 50 acres.

The CHAIRMAN. Where is it?

Dr. TAYLOR. It is about 14 miles out in Maryland.

The CHAIRMAN. Which direction?

Dr. TAYLOR. Toward Baltimore, fronting on the Baltimore, Washington & Annapolis trolley.

The CHAIRMAN. Is it near Beltsville?

Dr. TAYLOR. Near Bell Station. It is about $2\frac{1}{2}$ or 3 miles east of Beltsville, on a warmer soil, a soil more suitable for the handling of the wide range of plants which we have.

Mr. ANDERSON. That must be somewhere near the animal farm.

Dr. TAYLOR. It is about $2\frac{1}{2}$ or 3 miles from the Beltsville farm of the Bureau of Animal Industry and is an excellent piece of land for this purpose.

The CHAIRMAN. You paid \$200 an acre for that land?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. Is land that high there?

Dr. TAYLOR. Yes, sir. It rents for cash rental on that basis, where rented in that vicinity. This was a piece of land which had been occupied for 28 years by a very efficient farmer who came back to Maryland from South Dakota and put into effect a three-crop rotation, with potatoes, corn, and clover. It is an excellent piece of land, in excellent condition for our purpose. Of course we needed high-grade land in condition for immediate use.

The CHAIRMAN. Is that the prevailing price in that vicinity?

Dr. TAYLOR. Yes; for choice selections.

The CHAIRMAN. Are there any improvements on it?

Dr. TAYLOR. There are excellent fences, but no buildings on this portion of that tract.

The CHAIRMAN. Your next item is 108, "For the purchase, propagation, testing, and distribution of new and rare seeds; for the investigation and improvement of grasses, alfalfa, clover, and other forage crops." Do you propose to segregate that amount into two items?

Dr. TAYLOR. In 108 we recommend the separation of the two features which have been carried in a single item, namely, the purchase, propagation, testing, and distribution of new and rare seeds—these are field seeds—and the general forage crop work.

The CHAIRMAN. Why do you make that suggestion?

Dr. TAYLOR. In the interest of the clearer expression of the purpose of the appropriation. This is the only place in the bill where we have a seed distribution provided for in a paragraph along with investigational work.

The CHAIRMAN. Will that result in setting up two offices in place of one?

Dr. TAYLOR. No, sir; it will involve no increase of any character. It will not increase the expense of any character or the personnel.

The CHAIRMAN. What is the increase?

Dr. TAYLOR. Under the investigational paragraph, which is 110, the same character of investigational work as was carried previously under the joint item is contemplated.

The CHAIRMAN. You ask for no increase?

Dr. TAYLOR. Not for distribution. We do ask for an increase in the investigational paragraph.

The CHAIRMAN. I take it the price of seed has advanced. Can you meet the demands and requirements for seed with this amount?

Dr. TAYLOR. We feel that we can cope adequately with the situation as the prices stand.

The CHAIRMAN. How do the prices compare with those of last year?

Dr. TAYLOR. They are very materially higher for clover and alfalfa, but I think rather lower on the grain sorghums, kafir, and those forage crops of which there has been a large crop this year.

The CHAIRMAN. Are you sending out new and rare seeds?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. Have you not been sending out mostly alfalfa and Sudan grass for a number of years?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. Are you adding new seeds to the list?

Dr. TAYLOR. As a new strain or type is developed to the point where it appears unquestionably an improvement, the seed is distributed. Take, for instance, the Great Northern bean, which was included for the first time last year in the distribution and which was sent particularly to Montana and Idaho.

The CHAIRMAN. Will you furnish a list of the seeds sent out?

Dr. TAYLOR. Yes, sir.

(The statement referred to follows:)

Packages of new and rare forage-crop seeds distributed through the cooperation of Members of Congress, 1918-19.

Alfalfa:

Dakota	4,345
Grimm	2,320
Do	4,221
Kansas	15,020
Peruvian	1,225
Clover, red	
Cowpeas:	
Brabham	13,130
Early Buff	220
Groit	480

Fetërita	6,545
Field beans, G. N.	1,325
Field peas:	
Bangalia	3,925
Carleton	3,710
Kaiser	12,175
Paragon	
Kafir, D. B. H.	2,940
Millet, kursk	1,850
Milo, yellow	350
Natal grass	960
Rhodes grass	420
Sorghum:	
Dakota amber	470
Freed	50
Orange	
Red amber	4,470
Sumac	2,620
Soy beans:	
Biloxi	2,623
B. E.	805
Haberlandt	9,160
Hahto	
Ito San	4,200
M. Y.	2,520
Manchu	4,565
Peking	80
Tokio	1,360
Virginia	5,000
Wilson 5	3,140
Sudan grass	57,575
Sweet clover:	
White	1,765
Yellow	30
Velvet beans:	
Bush	1,206
Georgia	100
Osc	9,675
Total	186,575

Packages of new and rare forage-crop seeds distributed on miscellaneous requests.

Alfalfa:	
Dakota	50
Grimm (2-pound)	185
Grimm (4-pound)	74
Kansas	330
Peruvian	34
Clover, Red	49
Cowpeas:	
Brabham	189
Early Buff	29

Holdon.....	3
Lone Star.....	804
Trice.....	227
Total.....	1,449

Dr. TAYLOR. In the research paragraph (item 110) we propose material increases for the investigation of these important livestock supporting crops. The first item is an estimated increase of \$13,000 to meet the increased costs of labor and materials in the prosecution of the experimental work on forage crops carried on on the existing basis by the various field stations of this bureau. The reason for that is clear, I think, in view of the increased costs of conducting such work.

The CHAIRMAN. What do you propose to add to the list that you are now sending out?

Dr. TAYLOR. That is on page 104, Mr. Chairman.

The CHAIRMAN. That is to take the place of the language in 108.

Dr. TAYLOR. Part of it.

The CHAIRMAN. What do you add to it?

Dr. TAYLOR. We add no new language. We merely split the paragraph into two parts.

The CHAIRMAN. How much more money is required?

Dr. TAYLOR. Our estimate covers \$68,000 of new money for the items as they show on page 104.

The CHAIRMAN. Last year you had \$139,780 for the two items. Now you ask for \$56,600 for the seed item and \$148,480 for the forage crop work.

Dr. TAYLOR. The second and largest item is \$30,000 for pasture investigations, especially with reference to the southern coastal plain region.

The CHAIRMAN. You are asking for next year \$205,000 for the two items, 109 and 110, for which \$139,780 is appropriated this year?

Dr. TAYLOR. Yes; or an increase, including transfers to the statutory roll, of \$68,000. The largest item in that increase is \$30,000 for pasture investigations in the southern coastal plains.

The CHAIRMAN. That is new, is it not?

Dr. TAYLOR. That is new work. It is work which we have only been able to look at and attack in a very incidental way heretofore, and it involves the determination of the forage producing capacity of 75,000,000 acres of cut-over land in the South, where an effort is being made to develop an enduring and stable live-stock industry. There are some possibilities of livestock production on the range basis, but, apparently, every live-stock enterprise must have a tilled crop nucleus to tide it through shortages of pasture and range feed. The pasture problem of that region is not solved, and we believe the time has come to undertake investigations along that line.

The CHAIRMAN. Is this in cooperation with the Bureau of Animal Industry?

Dr. TAYLOR. Yes, sir. We carry the crop and pasture investigations.

Mr. ANDERSON. In what States is this land?

Dr. TAYLOR. This land starts in North Carolina and reaches around into the eastern part of Texas through the whole coastal plain.

Mr. ANDERSON. If that is true, there must be a very wide variation of soil and climatic conditions.

Dr. TAYLOR. There is a considerable variation in the soil and climatic conditions but not nearly so great as there would be in a straight strip from east to west across the country from North Carolina.

Mr. ANDERSON. My impression is that the Bureau of Animal Industry has been carrying on some experiments in the South with a view to determine the possibility of beef production and incidentally solve the problem of forage. What is going to be the difference between the work you are proposing and what they are doing?

Dr. TAYLOR. Our work is the production of crops. Their work is their utilization.

Mr. ANDERSON. When we started out with cattle, then, we got the cart before the horse apparently.

Dr. TAYLOR. In logical order; yes.

Mr. ANDERSON. I know it struck me that way at the time.

Is this section of the country settled up now, or is it open and uninhabited?

Dr. TAYLOR. It is scatteringly settled along the railroads, and in places farming is being attempted—has been attempted here and there. Many efforts have failed. Occasionally one has succeeded. It is a great national asset. It appears to have essential productiveness, which nobody knows how to materialize or bring through.

Mr. ANDERSON. I had an impression for some time that the greatest possibility in increasing the meat supply was in the South, but I do not just see how we are going to get any results from this investigation.

Dr. TAYLOR. Beef production, primarily, so far as we know anything of beef production, rests on grass or pasture, which is the cheapest feed that grows. The animal does the harvesting. The basic question here is whether the number of cattle that can be carried on it during the better feed periods of the year can be maintained through the year with forage crops which can be grown on the better soils under modern tillage methods right there in connection with it.

Mr. ANDERSON. Suppose you find out that you can raise grass down there, that you can raise enough grass to carry you over your period of scant growth, what are you going to do next? That is an interesting problem, and when you solve it what are you going to do about it?

Dr. TAYLOR. The stockmen of that region, if satisfied that a dependable adequate supply of feed can be grown, will, I think, take care of that phase of it. That is our judgment. They are ready waiting. They are investing; they are plunging in experimentation of their own. Some of them have had heavy losses. A few of them appear to be making progress.

Mr. ANDERSON. Are any of the States in which these lands occur making any investigations along this line?

Dr. TAYLOR. Not adequate investigations. It is a big regional problem. It has been so big that no State has undertaken to tackle it effectively.

Mr. ANDERSON. If it is simply a question of determining whether grass will grow down there or not, it is not a very big problem, it strikes me.

Dr. TAYLOR. It is a tremendously big problem in so far as we have knowledge of the dependability and reliability of grasses.

Mr. ANDERSON. Is it a question of the possibility of developing the kinds of grasses that will grow there?

Dr. TAYLOR. Of finding them and getting them there and trying them out and determining whether they will grow. The same is true of other forage plants, particularly the legumes. It is a country in which we have no reason to expect that alfalfa or red clover will succeed at all, but we have reason to believe that there are crops that will succeed there if properly balanced.

The next item, \$15,000 for red-clover investigations, is one of outstanding importance in view of the progressive decline of red-clover acreage in the Middle Western and Northern States. The figures of acreage and of yield during the last 20 years show a progressive decline, due to trouble in getting stands, trouble in main-

taining stands, so-called winter killing, some of which probably is actually winter killing and some of which is possibly ascribable to the use of imported seed from the southern European countries like Italy, which is not suited to our colder climates.

Mr. ANDERSON. When you say red clover, are all of the clovers that we are familiar with in the northern part of the country included under red clover?

Dr. TAYLOR. Yes, both medium and mammoth. The corner stone of our fertility in the Middle West, from the Great Plains eastward, is red clover. It is a difficult problem to attack—so difficult that the States have not attacked it. We believe the time has come when it must be attacked if we are not to witness a gradual decline of soil fertility in our corn and wheat lands, particularly our winter-wheat producing territory, and therefore an increased dependence upon commercial fertilizer.

Mr. ANDERSON. I do not know very much about farming, and may be this is an absurd question, but I had an impression that one of the reasons for the reduction in clover acreage is the increased use of alfalfa and other legumes—cow peas and all that sort of stuff—and the use of corn fodder. In the country with which I am familiar, while we recognize, of course, that clover has great advantages in soil improvement and so forth, it is more or less precarious, and always has been, owing to special difficulties. Hence a good many people are siloing their corn, raising cow peas, raising crops of that sort which perhaps are not so precarious.

Dr. TAYLOR. I think you are right so far as Minnesota and considerable portions of Wisconsin are concerned; but your farmers have not experienced the difficulties that the corn-belt farmers of Illinois, Indiana, Iowa, and southern Michigan (which latter is not distinctly corn-belt country), Kentucky, Tennessee, and further east, to a considerable extent in New York and Pennsylvania, have experienced. It is in our judgment a big practical agricultural question which needs solution.

Mr. ANDERSON. Are you seeking now in this project to ascertain the causes of the decline?

Dr. TAYLOR. Yes, sir.

Mr. ANDERSON. That is the purpose of this appropriation?

Dr. TAYLOR. That is the first step, and the next step will be the overcoming of those causes.

Mr. ANDERSON. You might find those causes to be such that it would be disadvantageous to try to overcome them.

Dr. TAYLOR. If that should develop, then we could stop there and proceed in some other direction with some other crop; but clover fits into the small-grain rotation as no other legume does in the corn belt, and the farmer hardly knows how to get along without clover, except to the extent that he can buy and apply fertilizer, and there is a limit to which he can go in that direction without reducing harmfully the humus content of his soil.

The remaining item in the paragraph, for which there is an increase, is \$10,000 for investigations looking to increasing the carrying capacity of semiarid range lands. The only probable improvement of those ranges with respect to their yield of forage appears to be the discovery and introduction of plants which can be brought

from countries having similar conditions. Plants which have shown ability to take hold and persist and spread come mostly from countries possessing similar conditions, and we feel that an effort should be made to determine whether crops can be obtained that will take hold, thrive, endure, and spread in the semiarid range country.

The CHAIRMAN. Has quack grass been tried out in the semiarid regions?

Dr. TAYLOR. Quack grass is a troublesome pest in certain parts of North Dakota where they want to raise wheat rather than grass.

The CHAIRMAN. Is that in the dry section?

Dr. TAYLOR. Not in the extremely dry section. That is more in the moist spots that get the run-off from the higher ground.

The CHAIRMAN. What is your next item?

Dr. TAYLOR. I believe that completes the list.

The CHAIRMAN. Item 111, page 105, "for general administrative expenses connected with the above-mentioned lines of investigation."

Dr. TAYLOR. There is no change in that, I believe. The congressional seed distribution, item 112, page 106, stands as it was last year.

Mr. ANDERSON. Was there any increase last year in that?

Dr. TAYLOR. As it is this year, I should say. The appropriation was increased for this year and the estimate carries the same amount for next year—20,000 vegetable and 2,000 flower packages. It increases the allotment a third from last year.

That would be the minimum. Of course that would be determined largely by the crop yet to be grown, but we feel that the highest prices for vegetable seeds are past, and that unless there should be a disastrous season in 1920 the quotas could be somewhat increased over those of the current year.

The CHAIRMAN. This amount will be sufficient to provide for the usual allotment?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. Is there anything else?

DEMONSTRATIONS ON RECLAMATION PROJECTS.

Dr. TAYLOR. We administer an item for demonstrations on reclamation projects, page 271, for which no increase is asked. The amount is decreased by the transfer of one clerk to the statutory roll now on this work. That is the demonstration work upon the Government reclamation projects, which carries to the farmers there the results of the work done at the field stations.

The CHAIRMAN. That is on page 271, item 1, "to enable the Secretary of Agriculture to encourage and aid in the agricultural development of the Government reclamation projects." That comes under your bureau?

Dr. TAYLOR. Yes, sir.

PREVENTION OF PLANT-DUST EXPLOSIONS AND FIRES.

Dr. TAYLOR. That, I believe, is all. There is an item in which the Bureau of Plant Industry is interested, Mr. Chairman, on page 285, paragraph 13, the dust-explosion investigation.

The CHAIRMAN. Does that come under your bureau?

Dr. TAYLOR. A small portion of it does; \$5,000 of the \$100,000 estimated for would be used by the Bureau of Plant Industry, which does the technical work of the smut-dust determinations, in connection with the experimental work in the Bureau of Chemistry; studying the causes of these explosions and devising methods of preventing them. That will be discussed, I assume, in detail by Dr. Alsberg, of the Bureau of Chemistry, which has the larger share in it.

I believe that is all, Mr. Chairman.

The CHAIRMAN. Thank you very much, Dr. Taylor. It is now nearly 6 o'clock, we will recess.

(Thereupon, at 5.50 o'clock p. m., the committee recessed until to-morrow, Saturday, December 13, at 10 o'clock a. m.)

Activities under lump-fund items, Bureau of Plant Industry.

Project.	Allotment, 1920.	Estimate, 1921.	Increase (roman) or decrease (<i>italic</i>).
Investigations of plant diseases:			
General laboratory investigations.....	\$16,500	\$16,500
Bacterial diseases of wheat.....	6,000	6,000
Bacterial diseases of corn.....	5,000	5,000
Bacterial wilt of cucurbits.....	4,000	4,000
Bacterial wilt of tobacco.....	6,000	6,000
Tobacco root-rot and similar diseases in Southern States.....	5,000	5,000
Pathological collections.....	10,000	10,000
Plant disease survey.....	9,520	24,520	\$15,000
Total.....	62,020	77,020	15,000
Fruit disease investigations:			
General orchard diseases.....	20,275	20,275
Citrus and subtropical fruit diseases.....	15,260	15,260
Grape and small fruit diseases.....	21,500	21,500
Orchard spraying experiments.....	5,800	5,800
Fruit rots and spots.....	11,600	11,600
Physiological fruit diseases.....	6,500	6,500
Pathological inspection of fruits during processes of marketing.....		7,000	7,000
Total.....	80,935	87,935	7,000
Citrus canker eradication.....	196,320	¹ 111,320	<i>85,000</i>
Investigations in forest pathology:			
Diseases of ornamental and shade trees.....	8,335	8,335
Pathological problems in wood conservation.....	17,440	17,440
Forest tree diseases.....	32,790	32,790
Imported and epidemic tree diseases.....	23,750	23,750
Total.....	82,315	² 82,315
White-pine blister rust control.....	220,728	³ 220,728
Cotton, truck, and forage crop disease investigations:			
Cotton diseases.....	3,700	3,700
Truck crop diseases.....	67,850	77,850	10,000
Forage crop diseases.....	3,660	7,160	3,500
Advisory extension work.....	4,120	4,120
Pathological inspection of vegetables during processes of marketing.....	8,470	18,470	10,000
Total.....	87,800	⁴ 111,300	23,500
Crop physiology and breeding investigations:			
Testing farms on Indian reservations.....	10,000	10,000
Date culture and breeding.....	14,500	14,500
Smyrna fig culture.....	4,500	4,500
Citrus breeding and testing.....	15,400	15,400
Dry-land arboriculture.....	2,000	2,000
Miscellaneous.....	2,060	2,060
Total.....	48,460	¹ 48,460

¹ Includes \$1,600 transferred to statutory roll.
² Includes \$1,200 transferred to statutory roll.

³ Includes \$6,560 transferred to statutory roll.
⁴ Includes \$2,400 transferred to statutory roll.

Activities under lump-fund items, Bureau of Plant Industry—Continued.

Project.	Allotment, 1920.	Estimate, 1921.	Increase (roman) or decrease (italic).
Soil bacteriology and plant nutrition investigations:			
Distribution and study of legume bacteria.....	\$12,050	\$12,050
Investigations in soil bacteriology.....	15,060	15,060
Plant-nutrition investigations.....	11,950	21,950	\$10,000
Total.....	39,060	49,060	10,000
Soil fertility investigations:			
Maintenance of soil fertility.....	8,436	8,436
Causes of unproductive soils.....	5,522	5,522
Transformation and formation of soil humus by biochemical factors.....	6,725	6,725
Origin of organic constituents in soils.....	5,051	5,051
Means for improvement of unproductive soils.....	4,235	4,235
Effect of fertilizers and soil amendments.....	5,091	25,091	20,000
Total.....	35,060	55,060	20,000
Crop acclimatization investigations:			
Acclimatization, adaptation, and breeding of cotton.....	58,280	58,280
Acclimatization, adaptation, and extension of corn.....	6,770	6,770
Acclimatization and adaptation of tropical plants.....	3,100	3,100
Production of fiber for binder twine.....	21,830	21,830
Flax fiber production.....	3,500	3,500
Hemp fiber production.....	4,000	4,000
Phormium (New Zealand flax) production.....	3,000	3,000
Miscellaneous fiber investigations.....	3,930	3,930
Total.....	104,410	104,410
Drug plant, poisonous plant, physiological, and fermentation investigations:			
Drug and related plants and their products.....	25,920	25,920
Poisonous plant investigations.....	2,500	3,500	1,000
Physiological and fermentation investigations.....	30,400	30,400
Total.....	58,820	59,820	1,000
Agricultural technology investigations:			
Free-living and plant-infesting nematodes.....	11,200	11,200
Fiber technology.....	8,340	8,340
Investigation of agricultural apparatus.....	1,790	1,790
Miscellaneous biological technology.....	3,110	3,610
Study of Hawaiian fungi other than cane.....	500
Total.....	24,940	24,940
Biophysical investigations:			
Cooperative biophysical investigations.....	17,500	17,500
Special biophysical investigations.....	15,000	15,000
Total.....	32,500	32,500
Seed-testing laboratories:			
Seed testing.....	15,460	18,360	2,900
Seed purity and vitality investigations.....	7,740	10,540	2,800
Adulterated-seed investigations.....	8,640	13,890	5,250
Enforcement of seed-importation act.....	4,840	6,790	1,950
Total.....	36,680	49,580	12,900
Cereal investigations:			
Production and improvement of cereals.....	94,805	129,805	35,000
Corn improvement.....	40,000	40,000
Cereal and flax tillage rotation investigations.....	3,000	3,000
Cereal-disease investigations.....	39,700	89,700	50,000
Black and stripe rust investigations.....	100,000	100,000
Barberry eradication.....	150,000	150,000
Corn root and stalk diseases.....	25,000	25,000
Total.....	452,505	537,505	85,000
Control of take-all, flag smut, and other cereal diseases.....	50,000	50,000
Tobacco investigations:			
New Eng and cigar-wrapper tobacco investigations.....	3,550	3,550
Maryland export tobacco investigations.....	1,700	1,700
Burley tobacco investigations.....	1,500	1,500
Western fire-cured tobacco investigations.....	1,800	1,800

¹ Includes \$12,800 transferred to statutory roll.

Activities under lump-fund items, Bureau of Plant Industry—Continued.

Project.	Allotment, 1920.	Estimate, 1921.	Increase (roman) or decrease (italic).
Tobacco investigations—Continued.			
New York binder and filler tobacco investigations.....	\$1,950	\$1,950

¹ Includes \$50,000 for the purchase of land and erection of buildings for plant detention station at Bell, Md.
² Deducting \$50,000 for purchase of land, erection of building, etc., in connection with the establishment of the plant detention and inspection station, the actual increase in funds under that project is \$31,500.

³ Includes \$1,500 transferred to statutory roll.

⁴ Includes \$1,200 transferred to the statutory roll.

⁵ Includes \$3,060 transferred to the statutory roll.

⁶ Includes \$3,000 transferred to the statutory roll.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Tuesday, December 16, 1919.

The committee met, pursuant to recess, at 10 o'clock a. m. Hon. Gilbert N. Haugen (chairman) presiding. Present: Members of the committee.

FOREST SERVICE.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF
OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. Col. Graves, we will be pleased to hear you.

Mr. GRAVES. The Forest Service is charged with three broad functions: First, the administration and care of the national forests; second, the encouragement of the practice of forestry outside of the national forests, through cooperation and public education; third, research in forestry, forest utilization, and forest products. Our work of examination and appraisal of forest lands in connection with the purchase of land under the Weeks law would naturally come under the first head—the administration and care of the national forests.

Our largest function is in connection with the public forests, an activity which engages from 85 to 90 per cent of our personnel and requires about the same proportion of our total expenditures. There are 151 national forest units. The lands aggregate over 150,000,000 acres, occurring in 26 States, in addition to Alaska and Porto Rico.

The CHAIRMAN. How many forests did you state?

Mr. GRAVES. There are 151 national forests and, in addition to that, there are some units which have not yet been organized as national forests.

Mr. JONES. What designates a unit? What do you mean when you say a "forest unit"?

Mr. GRAVES. A national forest, such as, in the East, the White Mountain National Forest, or in the list of forests—

Mr. JONES. How do you determine a unit?

Mr. GRAVES. There is a proclamation by the President declaring that a certain area is established as a national forest, giving the name and describing the area.

Mr. JONES. Then there have been about 151 of those proclamations?

Mr. GRAVES. Yes.

Mr. JONES. Describing particular sections?

Mr. GRAVES. Yes.

Mr. JACOWAY. How many acres have you in all?

Mr. GRAVES. There are nearly 155,000,000. The work of administering the national forests falls under several general heads:

First, the protection from fire, insects, and other injuries, of approximately \$1,000,000,000 worth of timber and young growth.

Second, the handling of the current business connected with the use of the resources, a business which brings in nearly \$4,500,000 in receipts and involves upward of 90,000 separate transactions every year.

Third. The improvement and development of the public property, making the forests more accessible and the resources more available for use.

Fourth. The classification of lands and the adjustment of private claims within the boundaries of the forests.

Fifth. The activities connected with the purchase of lands under the Weeks law.

Finally, investigations, experiments, and demonstrations to develop good methods of forestry and utilization.

One of our greatest tasks is the protection of the public forests from fire. We have had this last summer a culmination of three years of great drought in the northwestern forests, causing the most difficult season from the standpoint of protection in the history of the national forests. We have had the greatest loss from fires since 1910. The season was the most severe from the standpoint of drought since 1889. At that time they had also a series of three dry years with the intervening winters characterized by light snowfall. The result was that the ground was thoroughly dried out, the surface cover consisting of needles, limbs, and deadwood, thoroughly desiccated; the soil itself was dry to a great depth; many springs and streams were dried up, and the rivers were lower than for thirty years. The result of that situation was that when a fire got started, it ran very rapidly, much more rapidly than in ordinary dry years.

In addition, the trees themselves, after this series of dry years, gave out less water than usual by evaporation, because of the dryness of the soil, and there appeared an unusual amount of waxy substance on the needles and even under the epidermis of the needles. The fact that there was less water in the needles and the presence of this waxy substance made the tree crowns much more inflammable than usual. This explains some of the very curious phenomena which occurred this last summer.

Mr. JONES. And the trees are more subject to windfalls, are they not, with the extra dry land; they blow down easier, do they not?

Mr. GRAVES. I think that action did not occur very often. There was no very unusual amount of windfall this summer. I think it is more often that a windfall occurs where the soil has been very much soaked up and is very wet and soft. Of course, the soil got very hard and tended to hold the roots fairly well. The fires were about the same in number last summer as during the last two or three years. We had to fight nearly 6,250 fires. There were periods when there were an unusual number of lightning storms. Lightning would frequently set a good many fires on a single forest. We had 63 fires set by one dry electric storm. The swift movement of the fire—

Mr. JONES. That is on one unit, you mean?

Mr. GRAVES. Yes, sir. The swift movement of the fire may be illustrated by one or two incidents; one, for instance, where a fire ran up a slope having an elevation from the bottom, where the fire started, of about 800 feet, and perhaps a mile and a quarter distance, in 20 minutes. Near Missoula, Mont., one fire burned over 16,000 acres in 24 hours. A fire on one of the Idaho forests ran 20 miles in a single afternoon; another in the neighboring forest, 15 miles in half a day. Frequently on slopes, where the trees were some distance apart, open stands, with trees perhaps 10 or 20 feet apart, seemed to burst into flame all at once.

Under these conditions, the fighting of fires was unusually difficult, more particularly in the remote sections which have not yet been opened up by roads and trails. We have still very large areas in the Northwest where it takes from three to five days to get to a fire with a crew of men. Where the conditions of the forests are such as they were this last summer, obviously there is a considerable conflagration by the time the men reach those remote sections. It happens, also, that in a number of instances these remote regions are peculiarly subject to electric storms. The electric storms are more frequent in certain places than elsewhere. Among such centers of electric storms are some of the most undeveloped regions, and it was there we had our greatest difficulties.

Of the total number of fires, however, about 75 per cent were put out by our organization before they covered 10 acres. The balance, about 1,600 fires, covered more than 10 acres; and it is obvious that the greatest damage was done by them.

Mr. JACOWAY. How many fires did you have in all?

Mr. GRAVES. 6,234. The greatest cause of fires was lightning. In the Northwest, over 40 per cent of the fires were started by lightning. There was an increase in the fires set by campers this year, due to the fact that there were more campers in the woods than ordinarily. There was a decrease in the railroad fires. Our cooperative arrangement with the railroads has resulted in a considerable decrease in fires set from that cause, and in addition the patrols along the railroad succeeded in putting out a majority of the fires before they reached 10 acres.

Mr. JONES. And this would be by common carriers that have no interest in the adjoining lands, would it not?

Mr. GRAVES. Yes; although the Northern Pacific is interested in adjoining lands.

Mr. JONES. What is your experience about fires starting from the lumber operations or the tram roads—I mean as to doing any damage.

Mr. GRAVES. We have had a number of serious fires start from the tram roads. We had some fires start also from donkey engines and other causes in lumbering operations. Altogether, there were—

Mr. JONES. What percentage were set by campers this year? I do not want to anticipate anything you are going to say in the future.

Mr. GRAVES. I have that here.

Mr. JONES. If you are going to bring it out a little later, that will be sufficient.

Mr. GRAVES. Twenty-one per cent.

Mr. JONES. By campers?

Mr. GRAVES. Yes.

Mr. JONES. How do they get in there for camping operations? Is there any regulation with reference to that?

Mr. GRAVES. The people are allowed to camp in the national forests without permits, except on certain forests where the recreation use has reached a point that calls for such oversight.

Mr. JONES. What percentage by common carriers?

Mr. GRAVES. Ten.

Mr. JONES. Can you tell from your data whether the fire was started from the spark of the locomotive or from cigarettes thrown out of the trains?

Mr. GRAVES. It is pretty difficult sometimes to tell whether it is from that cause or even from some one walking along the tracks.

Mr. JONES. But it starts in the right of way?

Mr. GRAVES. It starts in the right of way.

Mr. JONES. That is 10 per cent, you say?

Mr. GRAVES. Yes. That is a reduction from the figure for last year, which was over 11 per cent, and that for the year before which was 13 per cent.

Mr. JONES. Is that in territory where they burn oil or coal?

Mr. GRAVES. Formerly the Milwaukee road burned oil, but now it is electrified. Other roads burn coal.

Mr. JONES. That is affecting the public lands? There are other roads that have to burn oil.

Mr. GRAVES. The other railroads running through the northwestern mountains burn coal.

Mr. JONES. That is, probably through your public lands they do. In the Adirondacks the locomotives have to burn oil.

Mr. GRAVES. Yes; they have to burn oil there. The Milwaukee was the only road burning oil in the Northwest.

Mr. JACOWAY. The road from Kansas City to Port Arthur, Tex., burns oil.

Mr. GRAVES. I had reference to the North. Of course, the Southern Pacific system should be mentioned.

Mr. JONES. How do you figure the balance of this 100 per cent? Forty per cent is started by lightning?

Mr. GRAVES. Forty per cent was in the Northwest. The average, taking the rest of the country, is somewhat lower than that. I will give you the list so that it can be balanced: Railroads, 10 per cent; lightning, 35 per cent; incendiaries, 4 per cent; brush burning, 5 per cent; campers, 21 per cent; logging and milling operations, 4 per cent; unknown, 18 per cent; and then a miscellaneous item, for which I have not yet the complete returns for this year, of 3 per cent.

Mr. JONES. You refer to incendiary fires; you mean set on purpose?

Mr. GRAVES. Yes. Of course, we are not always sure of that, but we generally classify as incendiary a fire where the evidence points to its having been set, even if we do not know who set it.

Mr. JONES. What do you call that last item?

Mr. GRAVES. That is a miscellaneous item of a number of causes for which the complete classification has not come in. Our greatest difficulty, outside of the lightning, was the careless fires, particularly

smoking. It is not so much the camp fire; we are getting the camper pretty well educated about leaving his camp fire, but it is the smoker who drops a cigarette while fishing or passing through the woods.

Mr. JONES. Have you had any reports of the action of the sun on bottles and glass?

Mr. GRAVES. No, sir. I do not know of any bottle fires this year, sir.

Mr. JONES. I know of some. [Laughter.]

Mr. RAINEX. There will be very few in the future. [Laughter.]

Mr. GRAVES. The losses of this year were very serious.

The CHAIRMAN. Have you an estimate of the losses?

Mr. GRAVES. Yes, sir. These estimates necessarily are preliminary, because the final checking on the ground has not been completed for such a large number of fires as we have had. I estimate, however, that nearly 2,000,000 acres were burned over this year. That is in contrast to about 700,000 acres last year and nearly 1,000,000 acres in 1917. Those are the three dry years that have culminated in the drought of the past season. Our worst season previously was in 1910, when more than 4,000,000 acres were burned. The damage was also very great. Our preliminary estimates are that approximately \$4,600,000 worth of timber was killed.

Mr. JONES. On what price did you base that; on the stumpage price?

Mr. GRAVES. We based that on our average stumpage price.

Mr. JACOWAY. What is that?

Mr. JONES. It is different, depending on different localities, is it not?

Mr. GRAVES. The field probably ranges from 50 cents for some remote timber up to \$2.50 and \$3 for the more accessible timber.

Mr. JONES. And depending on the character of the timber?

Mr. GRAVES. Depending on the character of the timber. That is probably a larger estimate than would be placed on the timber by a private owner. Some of this timber would not have been owned anyway by private individuals, because it is too remote. It nevertheless has a very real value to the public as a reserve supply.

Mr. JONES. I think, even if it was 2,000 miles from the railroad, it would be worth 50 cents as an investment proposition.

Mr. GRAVES. I have estimated, also, that the value of the young trees, the young reproduction, is approximately \$2,000,000.

Mr. JONES. This \$4,600,000 is for mature timber?

Mr. GRAVES. For trees that are of merchantable size.

Mr. JONES. Do you do anything after these fires to try to get a salvage out of it?

Mr. GRAVES. Yes, sir; whenever there is any possibility of it.

Mr. JONES. You can go into the hardwood tracts for three or four years after a fire and get salvage, can you not?

Mr. GRAVES. In 1910 we got a great deal of salvage from the burned timber (that year the total damages were about \$25,000,000), but we were disappointed in a great deal of the timber which we had hoped to salvage that year because it became checked, and deteriorated rapidly; and a number of the sales of dead timber which we had made were not possible to carry through because of the rapid deterioration.

Mr. JONES. What character of timber was that?

Mr. GRAVES. The principal timber which we were able to salvage was white pine, the Idaho white pine. Our loss this year in white pine will be relatively small. Greater damage has been done to other Rocky Mountain species.

The question which I was studying last summer on the ground when the fires were burning, and have been studying since then in our post-mortem examination of what happened at each fire, was whether it was necessary to have had such extensive fires and such extensive losses. I want to present the whole situation to the committee very candidly. I would like to repeat that the principal reason for the great losses this year was the season which, without any question, was the worst that has existed since 1889.

Our organization, for the most part, functioned better than in previous years, especially the overhead. We expected difficulty and we undertook to cure defects which we had by experience seen in our own work. I have never seen such an efficient operation of our overhead organization as occurred in the peak of the fire season. In regions like the Inland Empire, during this past season, when every few minutes wires were coming in from the local officers reporting new fires and great fires, calling for more help, calling for men, for supplies, and so on, these demands were taken care of promptly, economically, and efficiently. In spite of the labor difficulties, men were obtained, although the quality of much of the labor was very unsatisfactory; but such labor as was available was obtained and obtained quickly. There was a check and scrutiny of the expenditures which I do not think could be improved upon. There was a check on the judgment of the local officers as to the number of men who would be sent into a given fire, for that would be the point where the greatest cost would come in. The fact that it was not possible to reach the fires before the critical period was passed was the cause of the great loss. That was partly, for the most part, due to the conditions which made the fires run so rapidly that in some cases, if the officer did not arrive there within one hour, the fire was already a conflagration which had to be attacked as a large fire.

Mr. VOIGT. May I interrupt you to have you state, briefly, how you check a big forest fire; what the operation is?

Mr. GRAVES. If I may sketch very briefly the organization which takes care of that, it will be clear. We have in each of our forest districts, as, for example, that which has its headquarters in Missoula, Mont., a district office with its overhead organization for fire protection. When we see that a severe fire season is coming on we organize to meet the emergency and assign an adequate number of officers to be responsible for different lines of work; as, for example, the inspection, the furnishing of supplies, the obtaining of labor, transportation, and so on. There are inspectors who go out from the headquarters to work with the local officers. On each forest unit there is a forest supervisor who is responsible for all the work on the forest and, of course, responsible for all this protective work during the bad fire season. He has with him a number of officers, according to the needs of the locality, the hazard, and so on. In the case of very severe fires, additional competent men are sent to him to take

care of the local questions of transportation, supplies, and location of camps.

We have what we call our first line of defense, consisting of lookouts, patrol men, and smoke chasers. These men watch for fires and, when one is seen, go to it at once and try to put it out. It is through these men that over 4,500 of our fires were put out under 10 acres.

There is then a second line of defense, consisting of men who are working in the woods. These are road crews, trail crews, survey crews, local residents, saw-mill crews, logging crews, and so on.

Mr. VOIGT. Do not your lookout men have stations during certain seasons of drought?

Mr. GRAVES. Our lookout men are stationed on lookout points watching for fires. They are connected with other lookout stations—

Mr. VOIGT. By telephone?

Mr. GRAVES (continuing). And with the ranger stations by telephone or by signal.

Mr. VOIGT. That is the point I wanted to bring out.

Mr. GRAVES. When they observe a fire they locate it accurately through communication by telephone with other lookout stations and by triangulation. Then they notify the ranger, indicating the character of the fire, so that he can proceed to it, or send men to it.

Mr. HUTCHINSON. Are all those people under the employ of the Government?

Mr. GRAVES. Yes, sir.

Mr. HUTCHINSON. All of them?

Mr. GRAVES. All except our second line of defense. We have a cooperative arrangement with everybody we can get hold of in the country.

Mr. HUTCHINSON. The saw-mill men?

Mr. GRAVES. They are in the second line. Of course, they are not employed by the Forest Service. Sometimes they are on private operation; sometimes they are operating under contract for Government timber. We have an arrangement with them so that they will furnish crews immediately for fighting fires just as the ranchers and others come to our assistance.

Mr. HUTCHINSON. You pay them, then?

Mr. GRAVES. We pay them for their time. The third line of defense is the temporary men whom we employ to fight the larger fires. The smaller fires are put out by our own organization or by those who are working or living in the region. In the case of the larger fires, we have to bring in labor from the outside and it is there where we had the most difficulty this past year. When a small fire starts, one or two or a few men go to it and put it out. That is simply a matter of the use of the shovel or mattocks or rakes, or whipping with brush, according to the special conditions. Most of the small fires can be put out in that way.

In the case of a large fire, one must organize for it, to attack it in a deliberate way, to hem it in, and finally to surround it and put it out. That is done in this way: Imagine, if you please, a fire which is perhaps a quarter or half a mile long, a line running over an irregular topography, running up over this slope, down through this

swale, and so on, with a very irregular front. In the main, these fires, when they become pretty serious, have a head or series of heads where the fire is running ahead through inflammable material, here and there rushing up into the crowns and in some cases sweeping in a crown fire through a body of timber.

If it is possible, the first attack is made on the flank, and we try to pinch the fire out; not striking right in front of it but working from the sides. In such cases we work close to the fire, running a fire line very close to it and gradually putting it out. If, however, the fire is running up a high slope, we know that when it reaches the top the fire, which itself carries a tremendous draft, will meet a counter draft on top of the ridge from the other side and that it will be checked at that point. We send forward men to the top to hold it before it runs down the other side. We then aim to run a series of fire trails or breaks around the fire to prevent its crossing and spreading beyond certain points. The location of those fire breaks, lines, or trails, is, of course, one which requires a good deal of judgment and can only be done well by men who are thoroughly experienced.

In a very severe fire, those breaks ordinarily consist of a swath cut through the woods about 10 to 12 feet wide, removing all of the materials, trees and brush, cutting through the logs and snags that may be lying across the path. A trail is then run in the center of the swath down to the mineral soil, about 2 or 3 feet wide. That constitutes a break, from which we can attack the fire if it is located far enough ahead to give us time to locate it.

If the fire is running at a very severe and rapid pace, as in the daytime with a high wind, of course it is impossible to back-fire from that trail because the fire would be carried right across it. But at night there is usually a lull. Sometimes we back-fire at night. We have found that more often it is better to begin very early in the morning at daybreak. The wind usually does not come up until 8 or 9 o'clock, and we have several hours in which we can run a very long back-fire without danger.

In that way, we surround the fire and, after we have surrounded it and gotten it under control, we leave a number of men on the line to prevent the fire crossing. These men gradually pinch the fire out and it is extinguished.

Of course, there is in the life of every forest fire a certain point before which you must attack it if it is to be kept from becoming a conflagration; and the whole science of fire fighting is to get to the fire with the right number of men quickly before it reaches the danger point of a conflagration. Does that make clear the method of fighting fires?

Mr. VOIGT. Yes, sir.

Mr. GRAVES. This last season, while we faced greater difficulties than ever before, I am perfectly confident that we could have put out or reached a number of the fires before this critical period if we had not been embarrassed in the matter of securing competent men to put in charge of the fire fighting. We were also greatly embarrassed by the poor quality of some of the labor which we had to use.

We depend on our forest rangers and forest guard to report the fires and to determine how many men will be needed to fight them

and what plan of attack shall be taken. Afterwards, if the fire becomes a large one, we are depending on those men and on such foremen as we can pick up to direct the fight against the fire. The judgment of these men may determine whether the fire actually costs a few hundred dollars or \$25,000 or \$30,000, and whether there is a loss of almost nothing or a loss running up perhaps to \$50,000.

We were handicapped this year because we had a crippled field force. We had lost a good many of our best field men by resignation, and we were obliged to shift men from one point to another for replacements where we had lost men. But it was impossible with present salaries to replace all the good men who resigned with experienced fire fighters. The result was that we had to depend, in many cases, on inexperienced and even green men to decide very critical questions.

Still again, in the case of the larger fires, it was literally impossible to find competent foremen in numbers sufficient to meet our situation, men who had experience and who could carry these responsibilities and get away with it.

Because of this condition, there were fires which under normal conditions, and with a normal adequate and efficient force, we could have reached before they became conflagrations. There was, therefore, a distinct loss from the standpoint of the expenditures on that account; there was a loss on account of the damage, which otherwise could have been saved, due to the excessive number of resignations and the consequent crippling of our force.

Mr. McLAUGHLIN of Michigan. How far have you been able to save the timber after a fire has passed over?

Mr. GRAVES. In some cases, where the timber is accessible, we can make sales for perhaps a third to a half of the stumpage.

Mr. McLAUGHLIN of Michigan. But the timber does not burn beyond the point where it is good for saw timber; is not that true?

Mr. GRAVES. Unfortunately, in these regions most of these severe fires are in the inaccessible places where it is impossible to salvage the timber, because it would not pay to put in the necessary improvements to take it out.

Mr. McLAUGHLIN of Michigan. You have estimated the entire loss. I presume, during the year?

Mr. GRAVES. I gave that before you came in.

Mr. McLAUGHLIN of Michigan. And you have estimated the amount of the salvage—the amount you have been able to dispose of?

Mr. GRAVES. Probably about \$400,000 would cover that.

Mr. JONES. You might explain, however, that when a tree is dead and it is killed by fire it is useless as a commercial proposition; it does not have to burn up.

Mr. McLAUGHLIN of Michigan. Is that true?

Mr. JONES. Yes.

Mr. GRAVES. In the case of some species, if you can get it in time, you can get something out of it.

Mr. JONES. If you get it before it dies.

Mr. GRAVES. If you get the white pine before it begins to check.

Mr. JONES. You can get hardwoods out for four or five years afterwards, because it takes some time for the tree to die.

Mr. McLAUGHLIN of Michigan. There is, I think, a large element of salvage if the trees can be cut and put into saw logs and into timber without delay; is not that true?

Mr. GRAVES. Yes, sir. But it has to be pretty accessible in this western country to be able to get anything out of it at all.

Mr. McLAUGHLIN of Michigan. Does it rest with you to do all that? Are you not able to sell it to others who will do it?

Mr. GRAVES. This dead timber is for sale and we undertake to sell it; but the difficulty is finding a buyer for it.

Mr. McLAUGHLIN of Michigan. Where it is inaccessible to you, ordinarily it is inaccessible and not on the market for others, I suppose?

Mr. GRAVES. It would not pay to put in the improvements to take it out.

Mr. JONES. It would pay to give it away in order to reduce the fire risk, would it not?

Mr. GRAVES. You can not give away a great deal of it. We must remember also, that every forest fire leaves in its path an immense amount of dead material and trees which blow over and become an increased menace until the new forest comes up. There were occasions this summer where the fires were so severe that, at least in the case of the smaller trees, they actually consumed the entire trees. I have seen stands of pine, about three to five inches in diameter, where almost all of the trees were consumed and nothing left but little stumps, perhaps from 6 to 12 inches high.

The difficulty in our own organization is the fact that we have been unable to hold our rangers and guards at the salaries which we have been authorized to pay them. We simply can not get and hold for \$1,100 men who have had experience in the woods and as fire fighters and who are competent to handle this big responsibility we place on them. Of course, that standard of salaries also affects what we pay and can pay for outside labor as well. The low salaries of our field force is a factor which has resulted this year in a very real embarrassment and a very direct and large financial loss to the Government.

Mr. McLAUGHLIN of Michigan. Men who are employed by you in fighting fires are sometimes injured. You have a plan of reimbursing a temporary man who is injured, but not the permanent man; is not that the case?

Mr. GRAVES. The Federal Compensation Commission provides compensation for men who are killed or injured in the performance of their duties.

Mr. McLAUGHLIN of Michigan. Does that apply to you regular men?

Mr. GRAVES. Yes, sir; to all employees, without regard to whether they are permanent or temporary.

Mr. McLAUGHLIN of Michigan. I remember an effort was made to put that in the bill at one time and failed.

Mr. GRAVES. This was provided for in the Federal compensation act of September 7, 1916.

Mr. JONES. In States where they have a compulsory compensation law is the Government compelled to insure these men in that particular State?

Mr. GRAVES. No, sir. The Federal law provides for our own employees.

Mr. JONES. Both your permanent employees and your temporary employees?

Mr. GRAVES. Yes. We had, I think, seven deaths this year, mostly resulting from men being struck by falling trees. That is the most important phase of the work which I wish to discuss in the preliminary statement, Mr. Chairman. I think the other matters will probably come out in the discussion of individual items.

The CHAIRMAN. Thank you Colonel.

(Thereupon, at 12.30 p. m., the committee took a recess until 2 o'clock p. m., but, other business intervening, further hearing of the Forest Service estimates was postponed until 10 o'clock a. m., Wednesday, December 17, 1919, at which time representatives of the organized lumber industry were scheduled to appear before the committee to present arguments in favor of increasing the appropriation for forest-products investigations.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Wednesday, December 17, 1919.

FOREST SERVICE—Continued.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

(Most of the morning session was given to a hearing of representatives of the lumber industry on the forest-products item. See discussion under Forest Service item No. 244 at a later page in these hearings.)

The CHAIRMAN. You may proceed Col. Graves.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Mr. GRAVES. Mr. Chairman, I omitted yesterday in my general statement to explain the work which we did last summer, in cooperation with the Army, in the use of the airplanes in protecting our forests. Would you like to have me make a statement on this?

The CHAIRMAN. Yes.

Mr. GRAVES. Mr. Hawley was interested in the work and, as he is here now, I will say a word about that.

The CHAIRMAN. We will be pleased to have it.

Mr. GRAVES. The use of airplanes in fire protection has been advocated for a number of years. After the armistice was signed we took up with the War Department the possibility of some cooperation in the use of airplanes in fire protection. The officers of the Army were interested in the possibilities of combining the protection of forests with the training of aviators. The idea was to combine the training of aviators with a patrol of the forests and thus accomplish a double purpose. The result of the negotiations was that some experiments were started in California. On June 1 there

were started air patrols from three different bases of the air service. These bases were Mather field, near Sacramento, where two patrols were established in the forests immediately to the eastward; at March field, near Riverside, where two patrols were established on two of the southern California forests; and at Rockwell field, with one patrol on the Cleveland Forest. The five patrols covered about 6,000,000 acres twice a day. The average round trip of each plane was about 320 miles each day.

About September we had a flash of a hard fire season in northern California, and we asked the Air Service if they could not extend their patrol to some other of the northern forests. This was done, so that by the 1st of October nearly all of the national forests in California were under a general patrol of airplanes. The State Forester of Oregon also applied to the Army for some assistance, and a patrol was established in Oregon which covered most of the forests on the west side of the Cascades in that State. This furnished a very good practical experiment of the use of airplanes in fire protection, and we were able to judge as to whether it was practical. The conclusions are pretty clear. We can not, of course, substitute air patrol for the regular systematic ground patrol that we now have. Thus, at our lookout stations, we have a continuous observation during the entire day, while an airplane passes over a given part of a forest only twice a day. On the other hand, the airplane, by moving about, can see areas which are perhaps hidden from the lookout station by an intervening hill, or can look down into some of the canyons which can not be reached by sight from the lookout stations. So they pick up a good many fires that are not observed from a regular lookout station.

In a case of several large fires, the use of airplanes proved a very great value in directing the fighting forces on the ground. Where we have a long defensive line around the fire it takes an inspector from one to three days to cover the whole area which he could examine in an airplane in a very short time.

Mr. LEE. Have they means of communicating immediately this information?

Mr. GRAVES. We have tried the wireless telephone but that did not work perfectly and needs some further experiment. In some cases aviators land and send in their word from the nearest telephone. That was unsatisfactory. They used most extensively and satisfactorily carrier pigeons. These are taken in the airplane and sent back to the bases, whence the message is sent out over the telephone to our forest officers. A trial also was made of parachutes. In southern California, where there are a good many settlements, this was successful, and I think the majority of the messages were picked up as they were dropped and promptly sent to our headquarters.

The officers of the Army are very favorable to the forest patrol because it gives an exceedingly interesting line of work for the boys who are training. Moreover, there are many new problems in flying presented in the mountain forest region.

The proposal has been made by the local officers of the Army that there be a patrol extended over the whole of the Northwest; that is, to include California, Oregon, and Washington, the Inland Empire, with a subbase as far east as Cody, Wyo. This area comprises over half the remaining standing timber in the United States.

MR. McLAUGHLIN of Michigan. Belonging to the Government?

MR. GRAVES. Including that owned by the Government, the States, and private individuals. The suggestion is that there be a large cooperative undertaking between the Army, the Forest Service, the States, and private owners to work out a system of patrol next year. The Secretary of Agriculture has communicated that suggestion to the Secretary of War, who has not yet replied. As soon as he does, I would like to take the matter up again with the committee.

The CHAIRMAN. Would that require an additional appropriation?

MR. GRAVES. It would require some additional money for the Forest Service. I do not know whether the needs of the Army would be carried in the regular Army appropriation or not, or whether they would have to have some additional funds for the location of the fields, for the aviation bases, and so on. They ask us to furnish men at the various bases. One man is needed at each base to act as a liaison between the Air Service and the Forest Service. They request the Forest Service to take care of the carrier pigeons and handle various matters not pertinent to the Army appropriation. Probably the plan would involve an actual additional expenditure on the part of the Forest Service of about \$60,000. Private owners would be called on to spend in the aggregate a sum at least equal to that, the States would also cooperate to the extent of their ability, and the balance would be carried by the Army.

The CHAIRMAN. Would the private interests be called on to meet any of the other expenses?

MR. GRAVES. They would be called on to purchase lands for landing places and to do certain things which would be difficult for the Government to undertake. They would furnish connections by telephone to points which would fall outside of the Government lands.

The CHAIRMAN. Do they contribute now toward the work that you are doing?

MR. GRAVES. The private owners contribute their share where private and Government lands interlock. This is a part of a coordinated system for protection, covering whole States.

The CHAIRMAN. To what extent?

MR. GRAVES. About two-thirds of the private timberlands that are within the national forests are thus brought into such a cooperative arrangement.

The CHAIRMAN. What do they contribute—money?

MR. GRAVES. In some cases they contribute money to a cooperative fund.

The CHAIRMAN. What are they doing now?

MR. GRAVES. There are two methods of cooperation. One is to contribute to a fund that is administered by the Forest Service. Under the other method the expenses of protecting a given area are divided among the different owners on an acreage basis.

The CHAIRMAN. But all the time that they are working in cooperation, what are they contributing?

MR. GRAVES. They are not contributing at all for the protection of the national forests, but only for their own lands.

The CHAIRMAN. Can you state the amount contributed by private individuals for their own lands?

MR. GRAVES. I shall have to refer to my books on that. I will include it in the record.

Mr. HUTCHINSON. That is not put in this estimate, is it?

Mr. GRAVES. No, sir.

Mr. HUTCHINSON. Do you not think it ought to be?

Mr. GRAVES. You mean regarding aircraft?

Mr. HUTCHINSON. Yes; anything that has contributed toward this service. Do you not think it ought to be put in this estimate under another head?

Mr. GRAVES. That is always shown in our fiscal reports.

Mr. HUTCHINSON. I know; but we do not know anything about it until we get the separate report.

The CHAIRMAN. Mr. Hutchinson has reference to the amount contributed in the past, which he believes should be shown in the estimate. Is that paid into the Treasury?

Mr. GRAVES. Yes. All cooperative contributions are deposited in the Treasury. We have special authority to cooperate with the private individuals under those circumstances. These contributions are placed in the Treasury to the credit of the Forest Service as a cooperative fund, which we are authorized to spend in the building of trails and for similar enterprises. In southern California, for instance—

The CHAIRMAN. Will you furnish the committee with a full statement?

Mr. GRAVES. Yes, sir.

(The statement referred to follows:)

STATEMENT OF CONTRIBUTIONS TO THE CREDIT OF THE FOREST SERVICE COOPERATIVE FUND, FISCAL YEAR 1919, FOR INVESTIGATIVE WORK AND PROTECTION, IMPROVEMENT, AND BRUSH BURNING ON THE NATIONAL FORESTS.

There was a balance of \$90,259.83 on hand July 1, 1918. During the fiscal year 1919 \$522,840.05 was received from 1,181 contributors. These contributions varied from a minimum of 11 cents to \$101,406.80. Of the amount contributed during the fiscal year 1919, \$2,491.25 was for investigative work, \$387,603.38 for improvements on the national forests, \$122,279.35 for fire protection, and \$10,466.07 for brush burning following timber-sale activities on the national forests. The amount disbursed during the fiscal year 1919 under these cooperative agreements and included in the report of Forest Service expenditures is \$360,274.25. In addition to this amount, \$586.16 was refunded to contributors. The balance carried to the fiscal year 1920 is \$252,239.47. In addition to the direct contributions, there are many local arrangements whereby timberland owners furnish their share of patrolmen for fire-prevention work in accordance with the amount of their holdings which are intermingled with Government-owned national forest land and also pay their share of fire-suppression expenses when fires occur on the intermingled lands, directly paying the salaries of their patrolmen, their share of the bills, and wages for fire suppression.

Mr. McLAUGHLIN of Michigan. In the case of patrols for fire, all patrols for fire protection necessarily would be only there a small part of the year, when fires threaten, is not that true?

Mr. GRAVES. In California, from the 1st of June until at least the middle of October. In the Northwest, perhaps from the 1st of July until the middle of September or later, according to the season. It has quite a long, dry season.

Mr. McLAUGHLIN of Michigan. It is quite a difficult proposition, involving a good deal of expense, to establish that service, which would be in operation only a short part of the year?

Mr. GRAVES. It would be in connection with regular establishments of the Army. The idea is not to build up a special branch of the

Army for this purpose, but to have the work a supplementary or subsidiary activity in connection with the regular activities, so that the increased cost would be relatively small.

Mr. McLAUGHLIN of Michigan. I can see some value in it, but some of our people might, in view of the record of the War Department and the Air Service, hesitate to have the Department of Agriculture hook up with the War Department in any activity of that kind.

The CHAIRMAN. Do you care to make a statement, Mr. Hawley?

Mr. HAWLEY. May I have a few minutes to talk on this same subject?

The CHAIRMAN. Yes; certainly. We will be pleased to hear from you, Congressman.

STATEMENT OF HON. WILLIS C. HAWLEY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OREGON.

Mr. HAWLEY. Col. Graves has stated that two stations were located in western Oregon during the last summer for air patrol of the forests. The State forester of Oregon, Mr. F. A. Elliott, in a letter dated December 3, states [reading]:

The air patrol carried on in Oregon the past season by the United States War Department was nominally under my supervision, and I made a number of trips by aeroplane over the forest areas of the State and am fully convinced that great benefit can be derived from this branch of the War Department in discovery and location of forest fires.

There has been organized in Oregon, California, Idaho, Washington, and Montana what is known as the Western Forestry Conservation Association. These men own about 25,000,000 acres of timberland. They contributed last year, in cooperation with the Forest Service and for their own expenditures, over \$800,000 for the protection of the lands from forest fires. They are very much in favor of the extension of the Air Service to protect this Northwest area. They are willing to contribute any amount the Government may think is a just proportion of the cost of the operations during the fire season.

The Government has in these Western States 80,000,000 acres of forested lands; 80 per cent in volume in stumpage of the standing timber owned by the Government is in these five Northwestern States. The value of this patrol consists of several factors. The man in the air gets a different view of the situation from the man on the ground. There are fogs in the mountains, which very frequently cut off the view of the man on the lookout and prevent his seeing any very great distance.

But the man in the air, looking directly down, sees through the fog and can discern a fire. If we have forest fires of any considerable extent, such as we have had during the past three years on account of exceptionally dry summers, smoke settles down through the forest, and especially in the valleys, and the man on the lookout can not see through that volume of smoke, looking through it horizontally; but the man looking down from the air can see the twinkling of the forest fire, or its smoke boiling up through the older layer.

Col. Graves calls attention to the failure of the lookouts to see into the narrower canyons, and the broader canyons in many in-

stances. I think he will confirm this statement, that, so far as fires set by the carelessness of hunters are concerned, they usually originate in the valleys along the streams. Fires that are set by careless hunters or that may have been set by ill-disposed persons may escape the attention of the forest lookout for a considerable time, until the fire gets to a size sufficient to send a volume of smoke aloft that will attract his attention. But the airman passing over it would detect it very speedily and could report the location of the fire.

I have a statement here from the association just named that the Government's loss last summer in Montana and Idaho alone was about 3,500,000,000 feet of standing timber, and most of that will be lost to the market. Most of the trees, if not burned too deeply, can be marketed within five years and make a fairly good quality of lumber. After that they become worm-eaten or too poor in quality to make good lumber, and are not only of no value but become a menace to the forest.

Standing in these five Northwestern States are 1,500,000,000.000 feet of timber, a very large proportion of which belongs to the Government. We have become accustomed by the war in dealing with billions of dollars. This proposition deals with one and one-half trillions of feet of timber.

Mr. JONES. What per cent?

Mr. HAWLEY. Probably about half of it. If I am wrong, Col. Graves will correct me.

Mr. McLAUGHLIN of Michigan. The Colonel said 80,000,000 acres and that private interests owned 20,000,000.

Mr. HAWLEY. In the State of Oregon, if the owners of timberlands do not form an association to protect their own lands, satisfactory to the State forester, the State levies a tax against these lands at so much per acre, based on the cost of protection, and that is put on the tax roll of each individual holder, who pays the amount with his other taxes each year. I think most of the other Western States have similar laws.

Mr. TINCER. How much an acre is that, do you know?

Mr. HAWLEY. It depends on the fire hazard. The lands are patrolled under the direction of the State forester. At the end of the year he determines how much it cost, and the owners are assessed for the cost of the protection for their own lands. It has gone as high as 30 cents an acre for protection.

There is one thing that I want to mention before it escapes my attention, and that is the value to the flyers of this kind of work. When they are engaged in war, they must properly locate certain things accurately. In time of war they have the great incentive of winning. In time of peace in flying around in the air for practice and traveling from one place to another they learn how to fly and how to handle their machines, but there is no special incentive for them to study the ground, which they would be required to do in the event of war operations. If they are detailed to engage in this work of protecting the forests from fire, however, they must study the ground in detail as they pass over it, just as they would study an enemy's field of operations, and it would be of incalculable value in the training of these young men in the power of observation and ability to observe and report accurately the things they see. It

would be of very great value to the country if we should ever engage in another war.

Mr. McLAUGHLIN of Michigan. Is there an estimate of the number of stations that would be necessary and the number of men that would be necessary for the Department of Agriculture to employ, and so on?

Mr. HAWLEY. There is an estimate in a list given here of 12 stations that would be necessary. It might be found necessary to establish some more.

Mr. LEE. That is, in your State alone?

Mr. HAWLEY. No; in the five Northwestern States. There would be two on the west side of Oregon—one in the Willamette Valley and one in the Rogue River Valley (on the west side of the Cascades), and one on the east side of the Cascades, in Oregon. We have 600,000,000,000 feet of standing timber, about half of which belongs to the National Government, on the forest reservations and the public lands. I have many letters from practical men giving their opinion of the value of this patrol. They are practical men, who are right on the ground, who have lands to protect, who have paid large taxes, and who have an enormous investment there in the form of standing timber. They are unanimously of the opinion that this air-patrol service should be inaugurated and that that would be far better than to maintain solely the ground patrol; that the two, working together, will go far to solve the problem of controlling forest fires.

Mr. McLAUGHLIN of Michigan. Will he be able to dispense with the ground patrols to any extent whatever?

Mr. HAWLEY. That I can not answer from the standpoint of the National Government; but, from the standpoint of this association, I understand they intend to maintain the ground patrols. They have large investments in telephones, the use of which they loan to the Government; they have all that the Government needs in trails and in men for the work, and they in the past have contributed an amount equal to what the Government has, or their proportionate share of the cost of protecting any area, and I think they intend to maintain their ground patrols probably as they are.

Mr. JONES. They would have to have land patrols to put out the incipient fires the airplanes would disclose to them.

Mr. HAWLEY. The airplane would locate and report the fire, to get the men on it before it does a great deal of damage. The association anticipates that the money it puts into this will be money many times returned to the owners of lumber in the saving of timber.

Mr. JACOWAY. What was the value of the stumpage destroyed this year?

Mr. HAWLEY. Probably about 40 cents a thousand for investment purposes, taking the area as a whole. Possibly more.

Mr. GRAVES. It would be over 40 cents a thousand.

Mr. HAWLEY. Suppose you call it 50 cents a thousand. It would be \$1,750,000.

Mr. TINCHER. Have the questions to which you have referred been taken up with the aviation department—this proposition as to whether it would be satisfactory to them to do the training?

Mr. HAWLEY. Yes; the Forest Service has been in touch with them, and the Army is very anxious to engage in the work, for the reason that it will give the men practical experience in studying the ground and locating objects accurately, in order to make them more expert in the line of work in which they would need to be expert in the event of war.

Mr. TINCHER. They would confine their training in that line to that locality to some extent and perform this service, and it would do away with the amount that is appropriated—would very properly come off the amount that is appropriated for conducting that training?

Mr. HAWLEY. If they trained them in this work it would not be necessary to train them somewhere else, where they would simply be flying around without rendering any public service. If they are engaged in this work, every day's work they put in would be rendering a public service.

Mr. TINCHER. Your proposition, then, is to utilize them for this purpose?

Mr. HAWLEY. Yes; for the public benefit; giving the men the training they require and at the same time make it a public benefit to the country. This association and the companies represented by it will assist in the preparation of maps for the use of the aviators; they will furnish to the War Department the maps they have, which are in great detail.

Mr. JONES. Is that the North American Timber Co. that you are speaking of?

Mr. HAWLEY. No; this is the Western Forestry Conservation Association.

The CHAIRMAN. Have you any estimate as to the cost of these 12 new stations?

Mr. HAWLEY. The suggestion is that the contribution required by the Government from the standpoint of the Forest Service should be about \$60,000.

The CHAIRMAN. Considerable land would have to be purchased, would it not?

Mr. HAWLEY. I think the association owning these vast areas of timber will cooperate with the Forest Service in finding landing places, and they will provide a great many landing places themselves. Throughout the country there are open areas where aviators could land without much trouble and without necessitating much work in preparing the ground for use as landing places.

The CHAIRMAN. They would donate that to the Government?

Mr. HAWLEY. Yes; I think at Eugene, Oreg., they have already contributed a field, and in the Rogue River Valley they will do that for the home field. I think they would provide landing fields in the forest and they will cooperate in providing others. They come forward with the fair proposition to bear their proportionate share of the expense.

Mr. TINCHER. Would not the practical way be for the Government to establish a few aviation fields with training camps in this territory? As I remember it, the House the other day made an amendment to an appropriation bill from the Military Affairs Committee cutting out a field in Ohio. The practical way for the Government now to approach the situation would be to move the aviation field

to that territory so that the men in training could render a public service.

Mr. HAWLEY. I think they would require a number of fields so that the men employed in this service could be supplied the necessary training at those fields. Doubtless there would be other fields in other parts of the country to provide for men that would not be engaged in this service at all.

Mr. McLAUGHLIN of Michigan. Do you think that there would be such cooperation between the War Department and the Department of Agriculture in these matters?

Mr. HAWLEY. There was such cooperation last summer, I have understood, in California, and I know there was in western Oregon. By reports both of the War Department and of the Forest Service and of the representatives of the local companies that were interested the Army, the Forest Service, and the others worked together harmoniously by having one purpose in view; that is, doing the best kind of work they could in the business in which they were engaged.

Mr. JACOWAY. Who administered this combination fund; Col. Graves's department?

Mr. HAWLEY. I think the War Department administered its own fund and the Forest Service its own, and the private interests cooperated with the Forest Service.

Mr. HUTCHINSON. I understood you to say that the association contributed \$800,000.

Mr. HAWLEY. They spent last year \$800,000 for the protection of their lands. That includes what they contributed in cooperation with the Forest Service.

Mr. McLAUGHLIN of Michigan. Would that include what was paid in special taxes?

Mr. HAWLEY. No; that is in addition to taxes.

Mr. HUTCHINSON. They contributed that much to the forest people?

Mr. HAWLEY. Yes.

Mr. HUTCHINSON. Did they pay that into the Treasury, or how?

Mr. HAWLEY. I regret that I can not answer that question.

Mr. GRAVES. This large sum is the aggregate of all costs to the owners for the protection of their lands. It includes some cooperative expenditures.

Mr. HUTCHINSON. I think they ought to show what they got.

Mr. McLAUGHLIN of Michigan. They do show it in the reports.

Mr. GRAVES. I will be glad to bring that out in detail.

Mr. HAWLEY. This \$800,000 is not all that is expended by private interests in the protection of the timber in the forests of the Northwest. That is the amount spent by this particular association.

Mr. HUTCHINSON. There is no duplication between two patrols in one section?

Mr. HAWLEY. No; it is cooperative service.

Mr. McLAUGHLIN of Michigan. I have curiosity to know why this telephone service is so inefficient and why it is necessary to have the pigeons. It seems to me that the telephone, if well laid out and conducted, would be the best method.

Mr. HAWLEY. The answer to that is this: A man in the air with carrier pigeons might be 50 miles from a station, but he could dispatch a carrier pigeon which would go back to its home station.

Men would be sent out from the ranger station nearest the fire to fight the fire more quickly than if the aviator went back to find the man at the lookout to whom he might telephone, which might require him to retrace a hundred miles, make him lose a part of his day's work, and keep him from extending his trip over all the territory he is supposed to cover in a day.

Mr. McLAUGHLIN of Michigan. Is there telephone communication between all these lookout stations throughout the mountains?

Mr. HAWLEY. Yes; aviators would use wireless telephones.

Mr. GRAVES. You were referring to wireless, were you not? I said that the wireless telephone had not been working out satisfactorily. Our surface telephone system works satisfactorily, but the problem is for the air pilot to reach a telephone station.

Mr. McLAUGHLIN of Michigan. You have telephones at all these lookout stations? These are all connected up by telephone?

Mr. HAWLEY. They all have telephones or signal systems, and if a pigeon is released from an airship it will go home to its station, and that station can communicate to the other stations the location of the fire.

Mr. GRAVES. Yes.

Mr. LESHNER. How many men are in these airplanes?

Mr. GRAVES. Two.

Mr. HAWLEY. There is another answer to that question, Mr. McLaughlin, the question of the wireless telephone. If the aviator in passing over a station communicates or attempts to communicate by wireless telephone with the lookout, he must find a lookout in the station.

Mr. JONES. The lookout man does not leave his station, does he?

Mr. GRAVES. He was referring to the rangers. Usually that message is taken up by the ranger's wife.

Mr. JONES. The ranger would be in the field, but the lookout would be at his post?

Mr. GRAVES. Yes.

Mr. HAWLEY. I should have said rangers instead of lookouts. The lookouts are not sufficiently numerous in an area of such an enormous extent as that, comprising some 350,000 square miles. But lookouts and ranger stations are sufficiently plentiful for a man always to find one if he wants to deliver a message in a hurry.

Mr. GRAVES. There is no fundamental difficulty about reaching our forest officers in our stations by telephone. The main difficulty is to get the message quickly from the aviator after he sees the fire.

Mr. McLAUGHLIN of Michigan. To what extent have you had the pigeons so as to determine that that is the best way of communication?

Mr. GRAVES. Those were used this summer continuously, and they proved very successful.

Mr. McLAUGHLIN. You would need an everlasting lot of them. Where are you going to get them? I think in that statement you showed me, Colonel Graves, you provided for several flocks of them. How many?

Mr. GRAVES. Nine hundred and thirty pigeons. I have not heard of any suggestion that that number would be difficult to get.

The CHAIRMAN. The pigeons would have to be trained, would they not?

Mr. GRAVES. Yes, sir.

The CHAIRMAN. How long does it take to train a pigeon?

Mr. GRAVES. A comparatively short time.

The CHAIRMAN. Is that all, Mr. Hawley?

Mr. HAWLEY. Yes; unless there is some question. I request permission to insert a letter from F. A. Elliott, State Forester of Oregon.

The CHAIRMAN. Thank you, Mr. Hawley.

Without objection the letter will be inserted in the record.

(The letter referred to is as follows:)

OREGON STATE BOARD OF FORESTRY,
Salem, December 18, 1919.

HON. W. C. HAWLEY, M. C.,
Washington, D. C.

DEAR MR. HAWLEY: Complying with the request contained in your letter of the 8th instant, the following will give you a brief outline of the work of the aerial forest patrol and what I hope it will be possible to accomplish through its continuance.

Chief among the difficulties encountered in forest protection, especially in the more isolated districts of the State, has been the difficulty of getting reliable reports of fires to the ranger, guard, or patrolman in charge of the district in time for him to take effective action before the fire develops to such proportions that its control is very difficult.

The lookout system established throughout the forests of the State has been depended on heretofore to report fires. This system, however, is seriously handicapped during smoky weather. Also, under the lookout system, there is nearly always a section of country back of intervening ridges which can not be seen.

With the establishment of the aerial patrol during the past season a solution of these difficulties is in sight. The aerial patrol of the forests of Oregon, while conducted mainly along experimental lines during the 1919 season, has demonstrated beyond a doubt to those of us who have followed it closely the wonderfully beneficial results that may be expected through a continuance of the use of aircraft as an addition to the forest-protection system.

The airplane, equipped with wireless, follows a regular patrol route, established with the view of covering the largest area in the most effective manner. When a fire is discovered the observer makes note of its location, size, and any other feature having an important bearing, and immediately gets in touch with the nearest wireless station, or through message cans, with the ranger in charge of the district in which the fire is located. Knowing the approximate size of the fire and its location, the ranger can without further delay assemble men and equipment necessary for its control.

The airplane is not only effective for locating new fires, but, as was demonstrated on numerous occasions the past season, is extremely valuable in reporting progress on large fires. Experience has shown that a trained observer, after a reconnaissance from the air, can give more useful information about the character of a large fire in a heavily timbered area, than can a man on the ground. Controlled fires can be patrolled each day to see that they do not break out anew.

It is during smoky weather that the airplane patrol is much more effective than the lookout system. Neither smoke nor a difference of several thousand feet in altitude hinders the visibility as much as one would suspect. The intervening ridge which often shuts off the view of the lookout man is of no consequence to the observer in a plane since his altitude and changing position in the air give him a view of all the landscape over which he is flying.

While the area of effective visibility depends somewhat upon the atmospheric conditions and the altitude of the plane, at a height of 10,000 feet, under fair observation conditions, a very small fire may easily be detected at a distance of 30 miles.

The mechanical success of the planes is beyond question when it is considered that in flying approximately 60,000 miles during the 1919 patrol season there were but three forced landings, due to mechanical trouble, one of these resulting in the loss of one officer and his ship.

The Air Service personnel are highly enthusiastic and are eager to become efficient in this new line of work.

The peace-time policy of the War Department is to maintain an adequate flying force and to continue the work started during the late war. Since this necessitates continued practice in flying, the Air Service officials are anxious to determine the possibilities of performing a real and valuable service to the Government, State and community in conjunction with their regular prescribed training.

The tentative aerial patrol plan for 1920, as proposed by the Air Service and the interested protective agencies, embraces the States of California, Oregon, Washington, Idaho, Montana, and Wyoming. When it is considered that this patrol will cover one-half of the standing timber in the United States, and approximately 80 per cent of the merchantable timber in the national forests, and will undoubtedly be instrumental in saving vast areas from destruction by fire, at the same time furnishing such a practical line of training to the personnel of the Air Service, the question of its continuance with sufficient financial support from Congress to make it a success should be considered a forward movement in the protection and conservation of one of the principal natural resources of the nation.

I could write at great length, giving details of the past season's work and of what we hope to accomplish through the aerial patrol in the future, but, since you have Mr. Chapman's report on the resolutions of the air patrol committee of the Western Forestry and Conservation Association and also Col. Arnold's recommendations to the War Department regarding this work, anything further from me along this line would be merely a duplication.

I want to assure you, however, that all protective agencies in Oregon are solidly in favor of a continuance of the Aerial Forest Patrol, and anything you can do to insure its continuance with the proper equipment for its success will receive the full appreciation of your constituents.

Very sincerely yours,

F. A. ELLIOTT, *State Forester.*

Mr. McLAUGHLIN of Michigan. You consider that this is a necessary expense—that you can not dispense with any of the lines of work? This is in addition?

Mr. GRAVES. I do not see how we could squeeze out enough money from the present items to meet the cost incident to the air patrol. It will require an addition of \$60,000.

The CHAIRMAN. Col. Graves, it is now nearly 1 o'clock; we had probably better recess until 2.30, at which time we will hear you further.

(Thereupon, at 12.45 o'clock p. m., the committee took a recess until 2.30 o'clock p. m.)

AFTER RECESS.

The committee reconvened at 2.30 o'clock p. m., Hon. Gilbert N. Haugen (chairman) presiding.

FOREST SERVICE—Continued.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. Col. Graves, are you ready? There are no changes in the statutory roll, are there?

Mr. GRAVES. We are requesting to have the forest supervisors and forest rangers transferred from the statutory roll to a special lump fund.

The CHAIRMAN. We were in hopes of doing exactly the reverse.

MR. GRAVES. I appreciate the position of the committee on that, and I would not have presented this if we were not facing a very critical situation that is giving me a great deal of apprehension. I am unable to see any other way of meeting what is a real emergency. Either it must be done in this way, by transferring the men to a lump-fund roll, or by a readjustment and increase of the salaries of these men on the statutory roll. The Secretary felt that the latter was not feasible because of the work of the Reclassification Commission. Moreover, the positions, on account of the character of the work and responsibilities, are in every sense technical and highly specialized and as such should always have remained in the lump fund like other technical places. The situation is that I have got to find some way of meeting what is really an emergency—some way of holding an efficient field organization—if we are to safeguard the public forests and otherwise redeem our responsibilities.

The CHAIRMAN. We may look for a report from the Reclassification Commission soon, I believe.

MR. GRAVES. The forest supervisors, of course, are in the field, and the functions of the Reclassification Commission are confined to the District of Columbia.

The CHAIRMAN. When may we expect to have a report from the Reclassification Commission? Have you any report as to that, Mr. Harrison?

MR. HARRISON. The original law required that the report of the commission be submitted by the first week of January, but recently the chairman of the commission, Senator Jones, introduced a resolution in the Senate, which has not yet been passed, asking that the time be extended to March 12. He said that the commission could not finish the work in a satisfactory way within the time prescribed.

The CHAIRMAN. I believe that we decided at the start that we would not go into the matter of salaries until we had the report from that commission.

MR. HARRISON. The heads of the various departments decided that they would not include any salary increases in the estimates for next year in view of the fact that the Reclassification Commission is working on the problem. While the commission is confining its activities to employees in Washington, it was felt that, if Congress adopts its report, the same principles will be applied to the field services. The proposition here is to transfer some technical employees of the Forest Service to a special lump-fund roll, placing them on the same basis as other scientific and technical employees of the department. It does not involve any increase in the appropriation.

The CHAIRMAN. Why is the transfer desired?

MR. HARRISON. I suggest that you let Mr. Graves tell you some of the difficulties he has encountered under the present arrangement.

The CHAIRMAN. This is to meet an emergency?

MR. GRAVES. Yes. As I shall explain very candidly—

The CHAIRMAN. The question is, shall we take up these salaries, or wait and discuss them for the whole department at one time. That has been the plan on which we have been proceeding. We have not gone into the different questions as to salaries but have passed them over, as we did last year, with the thought of taking them all up later and consider them all under one head.

Mr. McLAUGHLIN of Michigan. Why do you want these scientific and technical men transferred?

Mr. HARRISON. They are scientific and technical employees in every sense of the word. The positions demand men of specialized training and experience in forestry, timber work, grazing, and other branches allied to forestry. But, Mr. McLaughlin, I suggest that you let Col. Graves explain the situation that is confronting the Forest Service in the handling of its personnel and the reasons for this suggestion. Then I shall be glad to answer any questions I can about the attitude of the department in the matter.

Mr. GRAVES. The forest supervisors and rangers are our line officers, if I may use that expression. They are men who are on the ground in charge of the forests and of the immediate business upon them. They are responsible for the actual work of protection and the successful carrying on of all the local business.

I referred yesterday to the difficulties we had had in fire protection because of the limitations of our statutory roll, that had resulted in a large loss to the Government from this cause. I have the same difficulties in other lines of business, leading already to complaints on account of the inexperience of new men who have replaced the more experienced men who have left us. The force as a whole is to-day less efficient than it was two months ago because of the loss of experienced men. It was less efficient two months ago than it was previous to that. Unless I am able to meet the practical situation confronting me—the matter of men leaving the service—our organization is going to be still less efficient six months from now. I am confident that we are not going to be able, with the present limitations of the statutory roll, to safeguard the public property and otherwise redeem our responsibilities another season.

The present roll was established in 1912 and has remained practically unchanged since then. The salary standard is so low that our experienced men are leaving, and we can not replace them at the present grades. On some forests we have had practically a complete turnover of personnel. On one forest within the last 18 months all the men, the entire personnel, has been changed, with the exception of one ranger, who is not up to our standard of efficiency. On another forest within a year we have had a change of personnel of all except two men. I have just received the resignation of the supervisor of one of the forests in southern California, and I fear that I may soon receive the resignation of the supervisor of one of the neighboring forests. Under present conditions I can not replace those men with others of the same efficiency. This process is going on throughout the field organization, a process of the melting away of the strong men upon whom we depend for the success of the public enterprise.

The positions of forest supervisor and ranger are very technical and highly specialized. It is essential that these officers have adequate technical training and experience. The supervisor must have a basic specialized training in technical forestry, in the lumber woods, in sawmills, or as an engineer, coupled with long experience in specialized forest work in the Forest Service. Ordinarily one must have served in our organization for 5 or 10 years to be competent to serve as a supervisor.

The forest supervisor has very great responsibilities, each being in charge of a great area of a million or more acres of public property. He is responsible for its protection, for the proper handling of all the current business of timber sales, use for grazing, recreation, and also for its improvement and development. The position is not merely executive; he must have a technical knowledge of forest growth, methods of reproduction, timber cruising and appraisal, and similar knowledge regarding the technical problems of grazing, building of trails, surveys of boundaries, adjustment of land claims, and so on.

The ranger, similarly, must have a training and experience to fit him for the handling of a forest district, of 100,000 to 200,000 acres in extent, under the direction of the supervisor.

Such men can not be found on the outside. They have to be selected from those having the basic technical training and experience and then become proficient by service in the Forest Service.

The present situation is that the older and strongest men are leaving and we are not, with the present salaries, able to build up the organization below with men of adequate training.

I first recommended to Secretary Houston that he permit me to present a radical readjustment of salaries so that I would be able to hold at least a considerable part of our best men, a thing that I am not doing to-day. He explained the situation which your committee faces with reference to any changes at all on the statutory rolls. I told him that if I had a lump fund of the sum total of the salaries of these officers I would find some way of making readjustments here and there to meet the changing conditions. This would enable us, at least for the present, to meet the situation. This I would undertake without requesting any increase in the total appropriation.

If we should make a readjustment of the statutory roll which would carry the salaries that should be paid for the positions and the responsibilities of the forest supervisors and rangers, it would involve a large increase of appropriation.

Under the lump-fund plan, and without an increase of appropriation, I should make certain promotions, readjusting the organization temporarily to meet the particular personnel situation as it may exist from time to time. The total number of officers would vary during the year. In some cases, one strong man would be placed in charge of two or more forests. The situation is changing so rapidly under the stress of numerous resignations that it is impossible to indicate precisely what salary grades will be necessary.

As an illustration of the emergency, take a group of southern California forests. Here I would undoubtedly have to violate what I believe to be the best principles of organization and administration. We ought to have three competent supervisors, each in charge of one of these three important forests. One has resigned, and I fear another may do so. I can not replace them, because competent and experienced men are not available for the salaries now permitted. In this case, if there were a lump fund, as requested, I would undoubtedly take the best of those three men, give him supervisory responsibilities over all three forests, and get along with poorer men in immediate charge as his subordinates.

Mr. McLAUGHLIN of Michigan. Approximately what is the area of each of these three forests that you speak of?

Mr. GRAVES. An average of about 1,000,000 acres.

Mr. LEE. For each forest?

Mr. GRAVES. Each forest.

Mr. LEE. How close are they together?

Mr. GRAVES. They are about 150 miles apart, I think.

Mr. LEE. I do not see how you could do it.

Mr. GRAVES. We would have to do it. It is the only way I can meet the present crisis. I fully believe that the loss to the Government last summer in our forest fires, due to our restricted salaries and consequent crippling of the organization, amounted to fully 20 per cent of the cost of fighting fires and of the damage by the fires. That means upward of \$2,000,000.

I am charged by Congress and by this committee with the responsibility of protecting the national forests, protecting them from damage and injury by fire. I am charged with an efficient administration of the forest business, involving very large financial values. I would not be doing my duty if I did not place before you the difficulties that I have under the present rigid and restricted system, carrying a scale of salaries established in 1912 for positions in which the responsibilities have been steadily increasing on account of the increasing demands of the business.

Mr. McLAUGHLIN of Michigan. In what respect has the demand increased?

Mr. GRAVES. I may illustrate in regard to a single line of business. This year we have had 50 per cent more transactions in timber sales than we had in 1914.

Mr. McLAUGHLIN of Michigan. Is that true, on an average, as to all the funds?

Mr. GRAVES. We have increased the number of stock on the national forests since 1914 by about 2,000,000 head. The responsibility of overseeing that work, getting a just allotment of the grazing privileges, and inspection of the work is constantly being intensified on practically all forests.

Mr. McLAUGHLIN of Michigan. Has the number of permits increased largely?

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. Has there been an increase in area to each permittee?

Mr. GRAVES. No; the number of permits has been increased by reducing the area allowed some of the larger permittees.

Mr. JONES. Do you have the lands cruised?

Mr. GRAVES. When we make a sale of the timber we make a cruise and an appraisal of the timber.

Mr. JONES. How is your cruise made; under any of the recognized systems of cruising, or is just an estimate made?

Mr. GRAVES. A regular cruise, under recognized methods.

On many of these forests the timber alone has a value of ten or fifteen millions of dollars. On one of our forests in the Northwest the value of the timber would be as high as \$30,000,000. The supervisor of that forest receives, as I recall, \$2,200 a year as the base salary. We are doing a business on some forests involving receipts of \$80,000 or \$90,000, with supervisors getting \$2,000 and \$2,200.

Mr. McLAUGHLIN of Michigan. The supervisor himself does not receive the money for the sales, does he?

Mr. GRAVES. No; but he is responsible for the administration of the entire forest, for its protection, and for all the work; he has to see that the sale is carried out properly. It is a very easy thing to make mistakes and use bad judgment. In much of this work a mistake or a failure to use good judgment may involve very great loss to the Government. We have really a gigantic business undertaking, and I feel that we should have your support in every way to secure an efficient administration of it. I fully appreciate what I am asking, and I come to you only because I feel that it is a real emergency and that this is the only way that I can meet it without asking for an increased amount of money.

Mr. McLAUGHLIN of Michigan. You have spoken of the supervisors. Will you give us something of the same information as to the others. A supervisor, you say, receives the basic salary of \$2,200. He gets the bonus?

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. Of \$240?

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. Is there any allowance to him in any way? Does he get a house?

Mr. GRAVES. No, sir.

Mr. McLAUGHLIN of Michigan. Does he get a machine or animals for purposes of travel?

Mr. GRAVES. No, sir.

Mr. McLAUGHLIN of Michigan. Is he paid for his traveling expenses in any way?

Mr. GRAVES. He is paid for his traveling expenses, like every other Government official traveling away from his station.

Mr. McLAUGHLIN of Michigan. Is he paid a per diem or his actual expenses?

Mr. GRAVES. At the present time I have the entire Forest Service on actual expenses.

Mr. McLAUGHLIN of Michigan. Then, there is no remuneration or allowance of any kind to him that would be, in effect, an additional compensation?

Mr. GRAVES. No, sir.

Mr. McLAUGHLIN of Michigan. Now, as to the others, some of them are provided with living quarters, are they not?

Mr. GRAVES. The rangers who are located away in the forests, away from towns, where there are no houses available for rent, are given quarters. We build a house for them.

Mr. McLAUGHLIN of Michigan. Is anything contributed in any way toward their living expenses?

Mr. GRAVES. No, sir. They are required to furnish their own means of transportation. They are required to own from one to three horses. They have to purchase them personally at their own expense. But we furnish the forage for those horses which are used exclusively for Government work.

Mr. McLAUGHLIN of Michigan. Are they bought and paid for out of their own money or are they supplied?

Mr. GRAVES. They are bought out of their own money.

Mr. McLAUGHLIN of Michigan. Have they any extra remuneration or anything of that kind?

Mr. GRAVES. They receive nothing whatsoever except the forage for feeding those horses.

Mr. JONES. Is it your conclusion that the statutory roll leads to inefficiency?

Mr. GRAVES. There is not the slightest question but that this statutory roll has broken down. It has led to inefficiency already. I can show you where it has led to definite and costly inefficiency in various instances in the Forest Service. I have failed to get the best efficiency because of it.

Mr. JONES. From what date has this been observed—that you are unable to supply these positions with men at the salaries fixed on the statutory roll?

Mr. GRAVES. My difficulty began about 1913, became intense along about 1914 and 1915, and during the war I was able to hold the men on the job absolutely only by appeal to their patriotism.

Mr. JONES. Then the question of the high cost of living is what brought it about in these instances, as well as with everybody else?

Mr. GRAVES. It has, in a measure, been the cause of it; but, quite regardless of the high cost of living, the whole standard of these salaries, which was established eight years ago, is too low compared with salaries for work of the same responsibility, both inside and outside the Government service.

Mr. JONES. Going back to my question, were you able at any time to get competent men at those salaries?

Mr. GRAVES. Yes, formerly; and up until within a year or two I was able to hold the bulk of the organization largely through appeal to loyalty and patriotism, and through the hope that I might secure a just basis of compensation. I would not, even if there had not been the recent high cost of living, have been able to retain them in the long run, because the standard is too low for the responsibilities of the positions. This applies not only to the supervisors, but with equal force to the rangers. The latter are getting a base salary of \$1,100 to \$1,200, which is too low considering the responsibilities placed upon them.

Mr. JONES. How do these salaries compare with salaries paid for similar positions in the State of New York, for instance, where they have them?

Mr. GRAVES. I am not sure that I recall just what the salaries of the State of New York are. The respective conditions are hard to compare, for they do not carry precisely similar responsibilities.

Mr. JONES. The State of New York owns about 1,600,000 acres in timberland, as I recall it.

Mr. GRAVES. I think Mr. Pettis, the State Forester, who has charge of the State forests, receives \$4,000 or \$5,000 a year.

Mr. JONES. I do not have reference to him. I have reference to the men out in the field—the rangers, fire wardens, and your forest protectors, out in the forest. Mr. Pettis lives in Albany. He does not get out into the field.

Mr. GRAVES. The district rangers in New York correspond to our district rangers, though they do not carry anything like the responsibilities carried by our men. The work in New York is almost wholly a protective job.

Mr. JONES. Yes.

Mr. GRAVES. The district rangers in New York receive \$1,800 and are furnished a car or other means of transportation. Our district rangers receive an average base salary of less than \$1,200 and have to furnish their own horses or car.

Mr. JONES. Then your men out in the field do work similar to what the men in the office at Albany do—Mr. Pettis and others?

Mr. GRAVES. Mr. Pettis's work corresponds, in part, to that of a forest supervisor and, in part, to a district forester's work. His work involves planning, protection, planting, and developing. As yet in New York there are no transactions which involve the sale of timber. As you know, they do not allow any cutting in the Adirondacks.

Mr. JONES. No.

Mr. McLAUGHLIN of Michigan. You have spoken of the supervisors and rangers and other men. Are any of these other classes of men supplied with homes?

Mr. GRAVES. No. You mean men like the guards or the other members of the Forest Service?

Mr. McLAUGHLIN of Michigan. Take it right down through these lines. There are the supervisors and the rangers; you have spoken of them.

Mr. GRAVES. There are a few stations remote from any town where quarters are furnished to the supervisor; not as a perquisite, however, but because we have to provide some place for him to live. We require him to live at the particular station, and we have to furnish him a place to live if it is not feasible for him to rent. Of course, any forest officer who is detailed to the forest for work at a point where there is an available ranger station would make his headquarters there.

Mr. McLAUGHLIN of Michigan. You have a large number of these men under general titles. You spoke of the supervisor. As you have just stated, he supplies his own house.

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. Do rangers have houses supplied by the Government?

Mr. GRAVES. A portion of them.

Mr. McLAUGHLIN of Michigan. How about the others?

Mr. GRAVES. None of them have.

The CHAIRMAN. Where do the forest guards live?

Mr. GRAVES. The guards are temporary employees. When on duty in the forest they make their headquarters at a ranger station or in camp. That is not furnishing them a home.

Mr. McLAUGHLIN of Michigan. It is a place for them to live and eat at the expense of the Government while they are doing the work, is it not?

Mr. GRAVES. Yes. If they were not there, they would be in camp, living in a Government tent.

Mr. McLAUGHLIN of Michigan. When they are living in a Government tent, are they supplied with their rations?

Mr. GRAVES. Oh, yes; while they are in the field, away from their station, just as though—

Mr. McLAUGHLIN of Michigan. How much time is covered by that?

Mr. GRAVES. Most of the field officers are out during practically the whole of the field season, which, of course, on the Pacific coast is a long one.

Mr. McLAUGHLIN of Michigan. During that entire time their living expenses are all furnished to them?

Mr. GRAVES. Yes; just like the members of a survey crew in the Geological Survey, or any other field crew, doing field work. While they are away from their station, their expenses are paid.

Mr. McLAUGHLIN of Michigan. As to a large number of them, that is practically all the time, then?

Mr. GRAVES. No; because, if a man is stationed at one point permanently, he does not receive his expenses. That is all covered in the fiscal regulations of the department. He has got to be on travel status in order to receive his expenses.

Mr. McLAUGHLIN of Michigan. But a large number of them are not permanently located; they are so employed as to receive this pay for expenses, or their living expenses, so that they do not have any headquarters; they live at the expense of the Government?

Mr. GRAVES. That is while they are in the field; yes.

Mr. McLAUGHLIN of Michigan. You say there are a large number of them who are in the field practically all the time?

Mr. GRAVES. Hardly all the time; through most of the field season; and then they are out at different times in other parts of the year.

Mr. RUBEY. What is the length of the field season?

Mr. GRAVES. In California it would be from June until about the middle of October. Ordinarily a field party doing work like timber cruising will start out from about the middle of June to July 1, and they might finish up the survey work by the 1st of October; some of them would be out longer than that.

Mr. RUBEY. What are these men doing at this season of the year?

Mr. GRAVES. Many of the men are at their headquarters during the winter working on the results of their summer work. If they have been on timber appraisals, they are working up those appraisals preparatory to the final negotiations for the sale of the timber; and if other work is necessary, they go into the field again. Of course, in case of men like scalers, who have their permanent headquarters at the sawmill or in connection with a logging operation, that is their permanent headquarters, and they pay their own expenses. They are located there permanently.

Mr. McLAUGHLIN of Michigan. A large number of these men, then, are in the field only three or four months, and then some of them have to make up a record of what they have done; but, ordinarily, that would not take very long. There must be several months in the year when many of them have nothing to do.

Mr. GRAVES. No, sir; that is not true. Our work is so diversified that there is a pressure of work during all the year. Take the case of our grazing examiners; they may be in the field in the summer for three or even four months, getting their field data by a survey and plan of grazing regulation on specific forests. They will be engaged for perhaps two months in working up their data, or it may take them considerably longer than that, where maps are involved. Then comes the allotments of the grazing for the year, involving the

assistance of these men to the forest supervisor. Then by spring there may be further work in preparation for the season's work, special inspection trips, etc.

Mr. McLAUGHLIN of Michigan. I notice you say there may be these different kinds of work. Ordinarily, is there that kind of work? I was trying to find out what these men do.

Mr. GRAVES. Yes, sir; there is. I have not been able to find any slack time for our examiners and scalers and others such as you suggest.

Mr. McLAUGHLIN of Michigan. I was trying to find out about these salaries. If the sum is paid to a man who works only a part of the time, or if it is paid to a man who has a home furnished to him, or if it is paid to a man who has his living expenses paid a large part of the year, it would be interesting to know that, as bearing on the question of whether or not his salary is sufficient.

Mr. GRAVES. Of course, in the matter of the traveling expenses while he is in the field, the condition is somewhat different in the Forest Service from what it was 10 years ago, or even what it was when this statutory roll was put into effect. We had a very much larger number of unmarried men in the service then than we have to-day. More men now have homes, and when they go into the field their expenses are just the same as when they are at home, so that there is no saving to them by having their expenses paid.

Mr. McLAUGHLIN of Michigan. That is in a large measure true, I suppose.

Mr. GRAVES. They are at work all the time.

Mr. CANDLER. Men like these supervisors are overworked, if anything; they are busy all of the year; there are some activities going on all of the year?

Mr. GRAVES. In the winter there is preparation for the field season, negotiations for timber, grazing, special uses, and a multitude of tasks connected with the handling of the forest business. The forest supervisor's office is a busy one. I have been personally on about 110 different forests and, I know the way the business presses. I drop into the offices and see that the business is increasing. The work that the men have to do allows no let up.

Mr. CANDLER. It requires their attention all the time. If they have a few days when they can get off, they have to be ready to respond when they are needed, all the time.

Mr. McLAUGHLIN of Michigan. You have men called lookouts watching for fires. There is danger of fires in only a small part of the year. What do those men do at other times?

Mr. GRAVES. Those men are employed during only a part of the year. They are not year-long men.

Mr. McLAUGHLIN of Michigan. They are paid only for the actual time they put in?

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. What are they called?

Mr. GRAVES. Lookouts, we call them.

Mr. McLAUGHLIN of Michigan. Are they included in the first part of this item?

Mr. GRAVES. No; they are forest guards. The forest guards are all short-term men. The statutory roll of the last bill called for an authorization for 100 forest guards at \$1,100 each for periods not exceeding six months and 40 forest guards at \$1,100 each for periods not exceeding three months. I have found that this is an inelastic and cumbersome arrangement, because frequently I want to employ one man for four months, or employ another for two months, or another for five months. The paper work alone connected with the appointments and shifts and changes is very great. It is costly, aside from its inconvenience.

Mr. McLAUGHLIN of Michigan. Here is this item: "One hundred forest guards at \$1,100 each for periods not exceeding six months in the aggregate." Does that mean at the rate of \$1,100 for the year?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. That would be \$550 for the six months. Is that what you pay them?

Mr. GRAVES. Yes.

Mr. HARRISON. That is the way the appropriation is made, Mr. McLaughlin.

Mr. McLAUGHLIN of Michigan. Then you have 40 forest guards at \$1,100 each for periods not exceeding three months. They would be paid at that rate for three months?

Mr. GRAVES. At the rate of \$1,100; yes.

Mr. LESHIER. Do they get any bonus?

Mr. GRAVES. After they have been with us a certain length of time the forest rangers who qualify get a bonus.

Mr. LESHIER. After six months in the forest?

Mr. GRAVES. Yes.

Mr. RUBEY. I notice you have here 1,030 rangers, 11 of them getting \$1,500 a year, 23 at \$1,400 a year, 78 at \$1,300 a year, 288 at \$1,200 a year, and 630 getting \$1,100 a year. I wish you would explain just what these rangers do—whether they are employed the entire year; what their work will be in the summer season, when you are expecting fires, and what it will be in the winter season, when you are not expecting fires.

Mr. GRAVES. The ranger is a year-long employee. He has charge of a ranger district, or a portion of one of a national forest. The ranger district averages about 100,000 acres in extent, and in some forests runs as high as 300,000 acres.

Mr. RUBEY. You have more than one ranger over each one of those districts.

Mr. GRAVES. No, sir; one ranger is in charge of the district. During the summer he is furnished additional temporary assistants, such as these lookouts, patrolmen, smoke chasers, or temporary labor, which may be employed for various purposes. He is responsible for all the activities in his district, taking care of the business as well as protecting the area which is under his charge. He has to plan out the work of protection and carry out under the direction of the supervisor a large number of activities. He is authorized to make small timber sales.

If a settler needs a little wood or a few logs, or if a portable mill wants to buy a small additional lot of timber, he is authorized to make such sales. In case of the larger sales which the supervisor

or higher officers are authorized to make, the ranger participates in many ways, both in the preliminary work and in their supervision and inspection. In many sales he must see that the terms of the contract are carried out, that the operators are making a proper disposition of their slashings in accordance with the contract, and so on. He keeps track of the stock which may be grazed in the district, inspecting the work, seeing that there is not an excessive number of the stock in trespass, seeing that the stock is properly handled and properly distributed during different parts of the season so as not to congregate in one place and overgraze at certain parts, and so on. He is responsible for the carrying out of the protective system, directing the work of the temporary employees under him. There is often more or less trail building and other important improvement work to be done in the district which the ranger supervises.

In case of fires he directs the fire fighting in his district. In many cases, in a severe fire season like the past summer, this may involve very responsible exercise of judgment. In the Flathead National Forest, in Montana, for instance, one ranger had about 250,000 acres under him. The fires were starting up at many points, and at one time I presume that there were a dozen or more fires burning. He was able to secure only two competent guards. The others were men such as could be picked up in the general labor market, and usually not experienced in fire fighting. The ranger was terribly handicapped on that account. He had, in other words, to take charge of all this fire fighting under such conditions in addition to any other activities that were pressing in his district.

The preparation for the work, the planning of it, the checking up of fire plans, the riding of the range where there is grazing at the close of the season to see what the effect of the grazing has been for the past season, the planning out of the work of allotments to different permittees of the grazing for the following year, the negotiation for timber sales and special uses, and planning of improvements are among the winter tasks.

It sometimes happens in areas in the north woods or in the mountains, which get snowed up in the winter, that the ranger has not upon his immediate district very much to do. He is then placed upon some special work, like the administration of sales or scaling. In other words, when the activities on his immediate district are not sufficient to keep him employed during the entire winter he is transferred to some other point where there are other activities and where we need men.

Mr. RUBEY. The point that I wanted to bring out is that he is employed all the time, the year around?

Mr. GRAVES. Yes.

Mr. RUBEY. And I judge from your explanation that he has plenty to do.

Mr. GRAVES. I have always felt that, as most of our forest work is far away, it would be an exceedingly illuminating thing if some member of this committee, if not the whole committee, could visit some of the national forests and personally see the actual activities on the ground.

Mr. RUBEY. Our Naval Affairs Committee and various other committees visit places of interest in their particular work, and I have

always felt that the Agricultural Committee might very well take a junket out into the Northwest and look over the forest situation.

Mr. GRAVES. I feel that it would not be a junket. I think it would be a very desirable thing as a matter of inspection of the work of the department.

Mr. RUBEY. We certainly could learn a whole lot about it.

Mr. CANDLER. I have believed for many years that we ought to do that. We do not know anything about it, and that is the only way that we can get information.

The CHAIRMAN. You speak about some of your men leaving you. What pay do they get?

Mr. GRAVES. Much more than the Government is paying. They go usually into some work allied with forestry. Many of our men go in with lumber companies in responsible positions. Many of the men in the Central West and Southwest go in with stock companies.

The CHAIRMAN. That is, they go in with them as partners?

Mr. GRAVES. No; as managers. That is what they are now. The supervisors of forests and ranger districts are managers. Then frequently they go into other miscellaneous positions. Our officers become known as competent men, and they are taken over as partners or managers or assistants in various lines of business.

The CHAIRMAN. At what salaries?

Mr. GRAVES. I have the exact figures here.

The CHAIRMAN. How much more do they get outside?

Mr. GRAVES. They get all the way from \$800 to \$2,500 more than they are getting now. I have a long list which gives exact figures. The average increase of supervisors who have resigned has been \$1,800; the average increase for rangers has been \$880. This is so far as I have records of the pay of the new positions.

The CHAIRMAN. In order to meet the emergency, what would you be required to pay?

Mr. GRAVES. I would promote supervisors here and there and pay some of them as high as \$3,000. It would be necessary to go above that at the present time only in one or two cases.

The CHAIRMAN. According to their efficiency?

Mr. GRAVES. According to their efficiency and the responsibilities of their work. Others I would pay \$2,800, \$2,600, or \$2,400. I would not be able to go very far, because the total amount of money is limited, and I could not reduce the number of men very greatly. The advantage would be, rather, in having an elastic system, whereby through salary adjustments I could meet the situation as I find it from month to month.

The CHAIRMAN. Without any increase in the appropriation?

Mr. GRAVES. Yes; without any increase in the appropriation.

The CHAIRMAN. How about these figures—\$1,673,540?

Mr. GRAVES. That \$1,673,540 is the aggregate in this group of men, Mr. Chairman, that we are asking to have transferred to the lump fund. That is a decrease from the statutory roll. It is merely a matter of bookkeeping.

The CHAIRMAN. It is taking from one roll and adding to another?

Mr. GRAVES. Yes.

The CHAIRMAN. I understand it, but I wanted to get it clear in the record. Is there any intention of increasing the fees for grazing permits?

Mr. GRAVES. We have increased the fees in the last two years.

The CHAIRMAN. What are they at the present time for cattle, for instance?

Mr. GRAVES. Cattle fees run from a rate of 80 cents to a \$1.50 per annum. May I ask Mr. Potter, who is in charge of grazing, to answer those questions?

The CHAIRMAN. Yes; I would like to get this all together so that we can refer to it in one place in the record.

Mr. GRAVES. Mr. Potter, will you answer these questions on grazing?

Mr. HARRISON. Would you not rather defer that, Mr. Chairman, until you get to the grazing items?

The CHAIRMAN. We have been dealing with grazing. I would like to get it all in one place.

Mr. HARRISON. It has only been incidentally referred to here.

The CHAIRMAN. If you prefer to do it that way, very well.

Mr. LEE. Why not wait until you get to your appropriation for that? Otherwise, we will be going over it several times.

Mr. McLAUGHLIN of Michigan. After all is said and done, this is a proposition to place \$1,600,000 in the hands of the bureau to pay such salaries as the chief may wish to pay, and the salaries can be put at any account; and Congress gives up all control over the question of salaries so far as that \$1,600,000 goes? You transfer a man to the lump sum and put his salary at what you please, and then you can transfer him back to the statutory roll at the increased salary. Could not that be done?

Mr. GRAVES. No, sir.

Mr. McLAUGHLIN of Michigan. Why?

Mr. GRAVES. Men are not transferred from the statutory roll to the lump-fund roll unless there is some change of duties that very distinctly changes their responsibilities.

Mr. McLAUGHLIN of Michigan. You propose to transfer a great many men from the statutory roll to the lump fund without any change of duties, do you not? Their duties are to be the same, are they not? It is for the purpose of enabling you to pay larger salaries if you find it necessary to do so, as I understand it.

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. Then, are you entirely right in saying that there can not be a transfer from the lump-fund roll to the statutory roll without a change of duties?

Mr. GRAVES. I am speaking of the system as it exists to-day. I am asking in these estimates to have these men put on the lump-fund roll; but as the appropriation bill stands to-day, we do not transfer men from the statutory roll to the lump-fund roll as an administrative matter unless there is a definite increase of responsibilities.

Mr. McLAUGHLIN of Michigan. There is no authority of law asked for here, is there? It is simply to decrease the statutory roll and increase the lump fund.

Mr. GRAVES. These men are definitely taken off of the statutory roll and placed on a special lump fund.

Mr. McLAUGHLIN of Michigan. Then, they can go back to the statutory roll without any law, can they not, and they will go back to the statutory roll, if you wish to transfer them, at the salaries that you fix for them on the lump-fund roll?

Mr. GRAVES. If they were not left permanently on the lump fund with other technical employees, and the committee wanted to put them all on the statutory roll, that would require consideration at a subsequent time.

Mr. McLAUGHLIN of Michigan. But there are often transfers from the lump-fund roll to the statutory roll, and in each case the salary provided is the salary that was carried on the lump-fund roll. Now, if you get these men onto the lump-fund roll, you can give them any salary you please, and then you can transfer them back to the statutory roll with that same salary, and that salary becomes permanent?

Mr. CANDLER. That has to be approved by Congress. They control it.

Mr. JONES. They can put them on the statutory roll, but we have to approve that in the bill.

Mr. McLAUGHLIN of Michigan. In this Book of Estimates a whole lot of them, hundreds of them, are transferred. That is one way to increase the salary of a man who is on the statutory roll. If he is getting \$1,000 on the statutory roll, his salary can not be increased, but he can be transferred to the lump-fund roll, and then his salary can be raised to \$2,000, and be transferred back to the statutory roll and carried there at \$2,000.

Mr. GRAVES. But that is only done where there is a new place created.

Mr. McLAUGHLIN of Michigan. Is not that statement correct? Have you any objections to the correctness of my statement about that?

Mr. GRAVES. There must be either a new place created or a vacancy. Employees are not transferred from the statutory roll to the lump-fund roll merely in order to permit their salaries to be raised.

Mr. McLAUGHLIN of Michigan. Pardon me, but did you not state that very thing? Did you not say in the beginning that you wanted to do that for this very purpose?

Mr. RUBEX. He is asking permission to do that.

Mr. McLAUGHLIN of Michigan. I am speaking of the effect of it.

Mr. GRAVES. Oh, yes; certainly. I was speaking of such transfers as may ordinarily be made administratively as between different rolls. I am perfectly frank about the purpose of the request I am making to have Congress transfer the forest supervisors and rangers to the lump-fund roll. This request is made because I have an emergency that I have got to meet and can not meet, as I see it, in any other way. The conditions are changing day by day. The situation is quite different to-day from what it was three weeks ago, and I happen to know enough about the situation to know that it is going to be very much changed within another six months—that a large number of our strongest field men can not and do not intend to remain much longer if we can not grant them relief.

Mr. HUTCHINSON. This does not say whether you shall have 500 or 1,000 men. You can cut your force down to 500 men and pay them the same amount of money that you paid the 1,000 men?

Mr. GRAVES. This is a practical question. I am responsible for doing a certain volume of work. I can not cut the force indefinitely. This would give us an elastic system and would enable us to expend

the total available money most advantageously in accordance with the special conditions prevailing at a given time.

Mr. HUTCHINSON. Do you not think some men are cheaper at \$2,000 than other men are at \$1,000?

Mr. GRAVES. I do not think there is the slightest question but that it is economy to pay enough to get men who are efficient. It is certainly not economy for the Government to have an inefficient man because the pay is too low.

Mr. HUTCHINSON. Could you not reduce your forces and pay more wages to your men?

Mr. GRAVES. I would have to make some reduction. I doubt whether that would be a desirable thing, permanently. My feeling is that the Reclassification Commission probably within two years will get to the field forces; but, pending that time, I have got to continue to do this work. I can not stop it as you could close a laboratory. In case of a good deal of scientific work one can suspend entirely for a time if he can not get men to do the work, and there would be no very striking and immediate public injury. But fires are going to burn in the forests next summer, and I have got to prevent them. There are men asking to buy timber to meet industrial demands. Thousands of people are using the forests and their resources, and their demands must be met efficiently or there will be a great public loss. The demand is there. The work can not wait. I can not do it with inefficient men.

Mr. McLAUGHLIN of Michigan. You are in a position to know what occurs each year when this bill comes up?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. There is very severe criticism each year when the bill comes up, because the lump-fund appropriations are so large.

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. Very severe criticism.

Mr. GRAVES. Still we have more people on the statutory roll in the Department of Agriculture than there are in any other department of the Government, with the exception of the Treasury Department, and they have a larger force than any other department of the Government.

Mr. CANDLER. The Agricultural Department has put a larger percentage of its people on the statutory roll than any other.

Mr. HARRISON. That is true, Mr. McLaughlin.

Mr. CANDLER. We are subjected to criticism, but we are not liable to criticism, because really we have been more efficient in putting people on the statutory roll than any other department of the Government except the Treasury Department. Taking the comparative number of employees in the Agricultural Department, and in the Treasury Department, there is proportionately a greater number on the statutory roll in the Agricultural Department than there is in the Treasury Department.

Mr. McLAUGHLIN of Michigan. The reason for the criticism, if there is reason for it, is that the Congress has no control over the use of the lump-fund appropriations, and that any salaries can be paid that the chief of bureau or the head of the department chooses to pay.

Mr. HARRISON. That is, within the limitation of \$4,500.

Mr. McLAUGHLIN of Michigan. Yes; within the limitation of \$4,500. Congress does not want to extend the lump-fund appropriation because of its influence over the control of salaries.

Mr. JONES. I wonder how many of the Members of Congress are capable of judging how much a man ought to get.

Mr. McLAUGHLIN of Michigan. That is true; but we are just suggesting that this would be piling up a lot of trouble for us in the House.

Mr. GRAVES. I appreciate that, and I came to you only because I am facing a crisis, a real emergency.

Mr. CANDLER. Frequently on the floor of the House when there is a salary that is proposed to be paid to some officer, somebody gets up and says that it is too much and makes a point against the increase, and possibly the Member who does that does not know anything about the duties that that man performs and does not know whether he is paid too much or too little. It is simply a lick in the dark.

Mr. ANDERSON. Yes; but there is no law that requires a Member of Congress to know anything. [Laughter.]

Mr. CANDLER. I did not catch the gentleman's remark.

Mr. McLAUGHLIN of Michigan. That was not directed against you, Judge.

Mr. GRAVES. I have tried to get along with this present statutory roll since it was established in 1912, and I can not maintain an efficient organization under it. This year I am not going to be able to get away with it and redeem my responsibilities to Congress and to the public. It can not be done.

The CHAIRMAN. It is difficult for Congress to determine salaries; but, after all, it is not so difficult to determine them after hearing the department. We should rely, of course, upon the recommendations and suggestions made by the department. It seems to me that the department could just as well suggest when the appropriation is fixed as a year afterwards what the salaries should be. It seems you ought to be in position to say, "Next year I propose to employ a certain number of foresters," or whatever they may be. "It is necessary for me to pay salaries of \$2,000 or \$1,500 or \$1,000," or whatever they may be; lay your cards on the table, and then let Congress determine whether or not they will approve of the suggestions made.

Mr. GRAVES. I can do that, but it involves a largely increased appropriation.

The CHAIRMAN. Would it not be the better way?

Mr. GRAVES. There would be involved a large increase in the appropriation.

The CHAIRMAN. If it has to be done, it can be submitted to Congress.

Mr. GRAVES. I have such a list.

The CHAIRMAN. You say you have a list?

Mr. GRAVES. Yes.

Mr. CANDLER. That increases the amount of the appropriation?

Mr. GRAVES. Yes; fully \$170,000.

Mr. JONES. Could not the committee follow the suggestion that has been made and decrease the number of men? That would be following out your suggestion.

Mr. GRAVES. I could not determine at this time what that decrease should be. This situation changes every time one of our old employees

leaves an important position. It is impossible for me to draw a rigid line now to meet that situation. I am afraid that it might be pretty embarrassing, as an effort to outline a salary roll for 18 months on the basis of the unstable conditions to-day would not be practical.

The CHAIRMAN. Is it not possible for you to estimate with some degree of certainty as to a certain number?

Mr. GRAVES. Yes.

The CHAIRMAN. For instance, if you should need, say, 300 men, you could estimate as to half, or as to 200. Then 200 could be placed on the statutory roll, and in addition a lump sum could be supplied, and left to your discretion as to the remaining 100.

Mr. GRAVES. You mean to put a portion of the men on the statutory roll?

The CHAIRMAN. I realize that you want discretion in the matter; but these lump-sum rolls have been criticized so much that I would hesitate in transferring a million and a half dollars or more from the statutory roll to the lump sum at this time—or at any other time.

Mr. GRAVES. Would it be of any assistance to have a limitation on top, above which no man should be paid?

The CHAIRMAN. Take this table, for instance. Here is one supervisor at \$3,040. Do you expect to have to change that?

Mr. GRAVES. That is what one man is now getting.

The CHAIRMAN. Do you have to increase the pay for that position?

Mr. GRAVES. No. Because—

The CHAIRMAN. Why not leave that as it is? Here is one forest supervisor at \$2,700. Is there any question about that place?

Mr. GRAVES. I have already indicated that I would need to place a number of men as high as \$3,000.

The CHAIRMAN. Then we get down here, and you pay 49 supervisors \$2,000 each. We might put 40 of them on the statutory roll, and also make an appropriation outside of that so that you could take care of the others on the lump sum.

Mr. GRAVES. Do you mean to make a sort of a classification and grouping of the men?

The CHAIRMAN. Of those that you have fixed and are satisfied in your own mind that you will not change?

Mr. GRAVES. That would be impossible at the present scale of salaries.

The CHAIRMAN. Then we will confine ourselves to these 49. How many of these 49 forest supervisors do you propose to increase in salary?

Mr. GRAVES. I can not tell you now how many would probably have to be increased during the year. I would not increase them all at once.

The CHAIRMAN. About how many?

Mr. GRAVES. I could not outline that in advance. It would involve the creation of a new statutory roll. If this system is necessary, the present situation can be met only by formal readjustments that will involve a large increase.

Mr. HUTCHINSON. Can you do that in one classification—pay one man one salary and another man another salary and keep harmony?

Mr. GRAVES. Of course, I would have to take care of that point, giving consideration to length of service and the competency of the men, just like one does in any business.

The CHAIRMAN. What is the next item?

Mr. GRAVES. It is on page 113. There is a request for increased authority.

The CHAIRMAN. An increase from \$800 to \$1,500 in the limitation on the cost of buildings erected on the national forests?

Mr. GRAVES. Yes.

The CHAIRMAN. State why that should be done. That suggestion has been made a number of times but turned down. It was increased from \$650 to \$800.

Mr. GRAVES. Yes, sir.

The CHAIRMAN. Why do you propose to increase it to \$1,500 at this time?

Mr. GRAVES. We find that it is not possible to erect these buildings for \$800 in many cases. We have cases where stations a few years ago could be built within the old limitations, but with the increased cost of labor and materials we find that it is impossible to build now. We have a number of cases where old buildings have been burned down and must be replaced. In many instances we have been unable to erect urgently needed buildings because it is impossible to erect what is needed within the prescribed limitations.

We are facing the need of numerous replacements where the old buildings are tumbling down or have been burned. It is impossible to build for \$800 a ranger station which is at all adequate. I have several estimates in my hand of buildings which it is desirable to build. An illustration occurs on one of the Wyoming forests, where a ranger station was burned in the spring of 1918. We find ourselves unable to erect a house there within the limitations. The station is 100 miles from a railroad, and in order to build a house of four rooms we would have to pay about \$800 for the material and \$600 for the labor, and the freighting in of the parts that would have to be brought in would cost \$100, so that right there is \$1,500. There are other similar examples where the cost runs up to \$1,400 or \$1,500 or more.

The CHAIRMAN. Do you contemplate remodeling or adding to any buildings?

Mr. GRAVES. Yes, sir. In some cases, where the original building was inadequate, an additional room or two is needed. This is the reason why we have inserted in the language of this paragraph "or improved," because if a building originally cost about the amount of the limitation existing at that time it would be impossible under the law to erect an addition, since it would bring the total for that building up to more than the former limitation. With the proposed change in language an addition could be made, provided it does not exceed the new limitation.

The CHAIRMAN. Have you not authority to repair?

Mr. GRAVES. We can repair but not enlarge. We could enlarge if the total cost of the building as enlarged would not exceed the legal limitation.

The CHAIRMAN. Why is it necessary to enlarge?

Mr. GRAVES. We have some very small houses, which are inadequate for the needs of permanent ranger stations.

Mr. McLAUGHLIN of Michigan. They are only temporary quarters, are they not?

Mr. GRAVES. No; in many of the cases they are permanent quarters, where a man lives with his family the entire year.

Mr. McLAUGHLIN of Michigan. I gathered from your answers to other questions that most of these structures are only temporary, and that the Government furnished very few permanent quarters to its employees.

Mr. GRAVES. No; I explained that a portion of the rangers were furnished with permanent quarters where we stationed them at points where it was impossible to get houses.

The CHAIRMAN. The purpose is to furnish them larger and better quarters?

Mr. GRAVES. Yes; where the present quarters are not suitable.

The CHAIRMAN. What did you mean when you spoke about enlarging? You have authority to make repairs, and you have been making them?

Mr. GRAVES. That is where the present quarters are not large enough. We have, in some instances, not furnished adequate quarters. In those cases we would furnish them better quarters.

The CHAIRMAN. In how many instances do you propose to furnish them with better or larger quarters?

Mr. GRAVES. I suppose there may be 20 or 30 buildings to-day that should be so improved. Is that right, Mr. Bronson?

Mr. BRONSON. There are about 50 altogether.

Mr. GRAVES. Fifty; and we will need in another year to build about 25 new houses.

Mr. CANDLER. In building these buildings, do you get any of the building materials from the forest itself?

Mr. GRAVES. Yes; in some cases we put up a log structure; but we find that the total cost of a log structure is just about as great as and in some cases greater than a frame house.

Mr. CANDLER. Could you get lumber sawed in those mills?

Mr. GRAVES. We can, in some instances.

Mr. CANDLER. When you do, you charge that up to the administration?

Mr. GRAVES. Yes; that has to go into the total cost.

The CHAIRMAN. What is the next item?

Mr. GRAVES. The next item is No. 81, on page 114, which we have just been discussing: "For employment of forest supervisors, deputy forest supervisors, forest rangers, and forest guards, \$1,673,540."

In No. 82, which is the general paragraph authorizing expenditures on the individual national forests, the words "of other employees," have been added, so as to make the paragraph read: "For salaries of other employees and field and station expenses," and so on. That would be a corollary of the transfer of the supervisors and rangers from the statutory roll, because the general expense items would not be used for the salaries of these officers.

The CHAIRMAN. That is not necessary unless we make the transfer?

Mr. GRAVES. No. Mr. Harrison, can I ask you about this?

Mr. HARRISON. Certainly.

Mr. GRAVES. Did you say that that item as to the Idaho forest and the Payette forest had not come over?

Mr. HARRISON. It came over, but when it reached the House it was sent to the Committee on Appropriations. Mr. Haugen is arranging for its transfer to this committee. I have a copy here.

Mr. GRAVES. A short time ago, something over a million acres of public lands were added in two forests in Idaho, and that bill has only recently passed and become a law.

The CHAIRMAN. You say you added to two forests. Are these included?

Mr. GRAVES. Yes; the Idaho and the Payette Forests.

Mr. HARRISON. Several changes are necessary. I have a copy of the supplemental estimate here.

The CHAIRMAN. I suggest that we take them up in their order.

Mr. GRAVES. The reason I brought that in here is because that change involves the employment of some additional officers who would be paid from this fund.

The CHAIRMAN. It may be better to take them up in the order in which they appear in the estimates, as we may have to refer to this on the floor of the House.

Mr. GRAVES. But the money which would go for the employment of the rangers and the deputy supervisors would be included in item 81. This amounts to \$10,000. In addition there has been added, for general expenses for this new area, \$10,775 to the general expenses of the Payette National Forest and \$18,980 to the general expenses of the Idaho National Forest. And the necessity of increasing that item is to take care of those extra officers. That was the reason I brought it up at this moment.

The CHAIRMAN. You want these items taken care of here?

Mr. GRAVES. Yes; so far as the salaries of rangers and an assistant supervisor are concerned. In addition there is an increase of the general expense items of the Idaho and Payette National Forests.

The CHAIRMAN. How much would that be?

Mr. GRAVES. For salaries of those new officers, \$10,000.

The CHAIRMAN. So the amount in item 81 should be increased by \$10,000?

Mr. GRAVES. Yes.

Mr. HARRISON. Do you wish the estimate inserted in the record now? It involves an increase in items 81, 138, and 175, and they are all indicated in a supplemental estimate, which with your permission I will insert in the record.

(The supplemental estimate referred to follows:)

DEPARTMENT OF AGRICULTURE,
OFFICE OF THE SECRETARY,
Washington, December 10, 1919.

THE SECRETARY OF THE TREASURY.

SIR: In accordance with the provisions of H. R. 1429 (Public, 69), effective October 29, 1919, the Thunder Mountain area, in central Idaho, comprising 1,095,022.11 acres, has been added to the Idaho and Payette National Forests—594,535 acres to the former and 500,485 to the latter. Since this addition was made after the estimates for the fiscal year 1921 have been submitted, it is necessary to increase the proposed appropriation for the Idaho and Payette Forests in order to provide funds for the administration of the new area. I am, therefore, transmitting herewith a supplemental estimate in the sum of \$39,755, together with a statement indicating the changes which should be made in the Book of Estimates (committee print).

Respectfully,

D. F. HOUSTON, *Secretary.*

Proposed changes in "Estimates of appropriations required for the service of the fiscal year ending June 30, 1921," for the Forest Service Department of Agriculture, occasioned by the addition of the Thunder Mountain area, in central Idaho, to the national forests:

Page 114. Item (81) and the note following it should read as follows:

(81) For employment of forest supervisors, deputy forest supervisors, forest rangers, and forest guards, \$1,683,540.

NOTE.—Of this amount \$1,673,540 covers places transferred from the statutory roll at the same salaries (see note under item 5). The remaining \$10,000 is to provide two forest rangers at \$1,100 for the Idaho National Forest and one deputy forest supervisor at \$1,500, three forest rangers at \$1,100, and four forest guards for six months for the Payette National Forest in the administration of the Thunder Mountain area, which became national-forest land by H. R. 1429, now Public, 69, effective October 29, 1919.

Page 117. Item (138):

(138) Idaho National Forest, Idaho (\$18,385), \$37,365.

NOTE.—This increase of \$18,980 for the Idaho National Forest is needed for the maintenance, improvement, and protection of the 594,535 acres of land formerly in the Thunder Mountain area, which will be administered as part of the Idaho National Forest.

Page 118. Item (175):

(175) Payette National Forest, Idaho (\$8,537), \$21,441.

NOTE.—Of the increase provided (\$12,904), \$10,775 is to cover the maintenance, improvement, and protection of 500,485 acres formerly in the Thunder Mountain area which will be administered as part of the Payette National Forest.

Page 121. Item (239): The amount \$4,000,627 where it appears under this item should be changed to \$4,040,382.

Page 122. The first paragraph of the note on this page should read as follows:

NOTE.—There is an apparent increase in this item of \$1,971,181, but, taking into consideration the transfer from the statutory roll to a separate lump-fund item of the forest supervisors, deputy forest supervisors, forest rangers, and forest guards enumerated in item 5, with salaries aggregating \$1,673,540, and the transfer from the item for general administration in the District of Columbia to the statutory roll of the Division of Publications of an assistant in charge of motion-picture activities at \$2,520, the actual increase is \$300,161. This results from changes in 98 of the individual forest items, providing for increases in 91, amounting to \$328,886, and decreased in 7, amounting to \$28,755. Of the net increase of \$300,161, \$39,755 is for the administration, including salaries (see note under item (81)), of the Thunder Mountain area; \$136,672 is for additional fire protection; \$69,438 for timber sales and forest management on the national forests; \$35,528 for grazing administration; \$2,600 for the care of buffalo and game on the Wichita National Forest and Game Preserve, Okla.; and \$16,168 for increased costs of travel and other miscellaneous items of general expenses in connection with the administration of the national forests.

Page 123. Change first table by the following insertions and corrections:

National forest.	Appropriation, 1920.	Appropriation, 1921.	Increase
Idaho.....	\$18,385	\$37,365	\$18,980
Payette.....	8,537	21,441	12,904
Total.....	1,029,554	1,319,715	318,886
Net increase.....			290,161

Make following changes in table "National forests" pages 123, 124, and 125:

Employees.	Rate.	Estimated, 1921.
Salaries:		Number.
Deputy forest supervisors.....	\$1,500	30
Forest rangers.....	1,100	265
Forest guards.....	1,500	116
Clerks.....	1,080	1
Wages, miscellaneous and temporary labor, \$125 to \$60 per month.....		3,803
Total.....		5,747
Salaries.....		\$1,926,022
Wages.....		848,183
Other objects of expenditure, miscellaneous items.....		261,990

¹ Temporary.

Page 139. Change "\$5,745,775" to "\$5,785,530."

Page 140. Change "\$5,745,775" to "\$5,785,530."

Page 140. Change "\$6,557,895" to "\$6,597,650."

Mr. McLAUGHLIN of Michigan. As a general proposition, why are laws passed, introduced by Members from the States, to add some of their lands to the national forests? I know many of the Members from those States resent the entire proposition of the national forests. They do not like it. They would like to have the lands released to be controlled by the States. On the other hand, others introduce bills to add some of their area to the national forests. It looks to some of us as though they had found some land out there that they did not want, which was no good to them at all, and which they wanted to attach to a national forest.

Mr. GRAVES. The situation would be best illustrated by a word about this particular area. In central Idaho, in the remotest and undeveloped region, is a large area of forest land that has remained as public land, uncontrolled and unprotected, since the establishment of the national forest. Fires have burned uncontrolled on the area, threatening and damaging the surrounding forests. There has been no control of grazing, and this land has been used by sheep. Over 300,000 sheep were crowded in in 1918, whereas the grazing capacity is not over 75,000 or 80,000. The result is that that country is burning up. The land is being overgrazed, with resulting erosion, and the country, which has great possibilities for development and use, is becoming so injured that the people of Idaho themselves, who in former days were very much opposed to the Forest Service, have requested the addition of the area to the national forests. The Idaho Legislature in two successive sessions memorialized Congress to set this area aside as a national forest.

Mr. LEE. What is the area involved?

Mr. GRAVES. Over 1,000,000 acres. There are minerals there. Formerly a great deal of prospecting was done, and there are still mineral possibilities; but there is no mineral development because that land is so remote, and it is not being developed, no roads are being built in there, and it is being subjected to a great deal of damage. Last summer fires started in that section, and there was no one there to watch them. Some of the fires worked over into the neighboring Idaho forest, entailing great damage, and costing a large sum to check.

Mr. McLAUGHLIN of Michigan. It was Federal land before?

Mr. GRAVES. It was Federal land, in the public domain, and lying absolutely unprotected and unregulated. It is for the organization of this new area and its administration that we require the increases in item 81, for the salaries of new forest officers and in the general expense items for the Payette and Idaho National Forests. We come now to the list of individual national forests, items 83 to 238, inclusive.

Mr. LEE. What are the names of those new forests in New England?

Mr. GRAVES. The White Mountain, in New Hampshire; the Pisgah, in North Carolina—

Mr. LEE. The White Mountain and the Pisgah, and then there is one below here.

Mr. GRAVES. Natural Bridge and Shenandoah.

The CHAIRMAN. What is the increase there?

Mr. GRAVES. There are increases for the individual forests involving changes in 97 of the forests. There are increases in 90 of those and decreases in the cases of 7 of them. The increases are for several different purposes. There are a number of increases for protection, aggregating, for all of these national forests, \$136,672. That applies to 49 different forest units. There is an increase requested for expenses and additional salaries of temporary men, chiefly in connection with timber sales and general administration, of \$69,438, involving 39 forests.

Mr. McLAUGHLIN of Michigan. Nearly \$2,000 a forest.

Mr. GRAVES. For increased expenses in connection with the grazing administration, \$35,528 on 40 forests.

For increased cost in connection with travel and other miscellaneous expenses, \$16,168 on 43 forests.

An increase of \$2,600 on the Wichita National Forest in connection with the care of buffalo and game. The Wichita Forest is primarily a game refuge and preserve, on which we have a large herd of buffalo and a great deal of other game.

Mr. McLAUGHLIN of Michigan. Does the Biological Survey have anything to do with that forest?

Mr. GRAVES. The Forest Service has the direct responsibility for administering it, but we are using the service of the Biological Survey in connection with many of the problems of game culture.

Then, there is an increase of \$39,755 for these new additions to the Idaho and Payette Forests.

Mr. McLAUGHLIN of Michigan. Then, the gift of these lands, wishing them onto the Forest Service, involves a good deal of expense to the Government?

Mr. GRAVES. Yes, sir. If they had been under administration last summer, we would probably have saved \$100,000 in fire fighting and besides prevented the destruction of a lot of timber.

The CHAIRMAN. Was this land owned by private parties?

Mr. GRAVES. Yes, sir; it was public domain. This makes an aggregate increase for all of the national forests of \$300,161. I have prepared a detailed statement explanatory of each one of these items, which you can put in the hearings if you choose to do so.

The CHAIRMAN. Have you that prepared in pamphlet form?

Mr. GRAVES. Usually this statement is filed with the committee and inserted in the record, and I have this all prepared.

Mr. McLAUGHLIN of Michigan. Is there not a similarity in service on each one of these forests?

Mr. GRAVES. No, sir. There is a similarity in the work, but a very great diversity in forests in different regions. Even in the fire protection there is an enormous divergence, in accordance with the hazard, and there is a great variation in the demand for timber and demands for grazing.

Mr. McLAUGHLIN of Michigan. Then the differences are in fire protection and the demands for timber and grazing. What other items of expense are common to all these forests?

Mr. GRAVES. There is often a great deal of activity in connection with the recreation use; but that is ordinarily a use of time of the regular force. Great numbers of campers come into the mountains and create demands for camp sites and sites on which to put up summer homes. In some of the forests it is a very active business.

Mr. JONES. I do not want to anticipate your complete report, but does this estimate show your receipts to the Government for sales of timber and for grazing?

Mr. GRAVES. That is shown in my annual report.

Mr. JONES. It is not shown in this Book of Estimates?

Mr. GRAVES. No, sir.

Mr. JONES. That money is turned into the Treasury?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. From the statement which you submitted here as to the activities in each of these forests, I gather from what you say that, while there is more work of one kind than another on some forests than on others, the character of the work is the same.

Mr. GRAVES. The question is of the volume of work of the different classes.

Mr. McLAUGHLIN of Michigan. That is, they differ as to volume?

Mr. GRAVES. Yes, sir. We have been trying to take care of a large amount of stock on the national forests.

Mr. McLAUGHLIN of Michigan. So that, if a question is asked about how the money is spent on a particular forest, it can be answered by saying that part of it goes for fire protection, part to look after the grazing, part to look after the sale of timber, and some for the locating of camps and buildings for recreation use and for summer homes, and so on?

Mr. GRAVES. That (referring to the descriptive text) is tabulated on one sheet, and I think you will find that this is not as voluminous as it appears, because many of those individual sheets contain only a few lines. You see, there is one page to a forest.

Mr. JONES. In round numbers, what were the total receipts from the forests?

Mr. GRAVES. About \$4,360,000.

The CHAIRMAN. Have you reached the item where you wish to deal with the question of receipts?

Mr. GRAVES. That does not come under any particular item.

The CHAIRMAN. We want to discuss it all at one time. Where does it come in?

Mr. GRAVES. I think this would be a desirable place to insert in the record the amount of business which has been done during the past year on the national forests.

Mr. JONES. Your total appropriation for this fiscal year is how much; about \$5,750,000, is it not?

Mr. GRAVES. It is about \$6,000,000.

Mr. JONES. And you say that your receipts for the last fiscal year were about \$4,000,000?

Mr. GRAVES. \$4,360,000.

Mr. LEE. I suggest that you give us the dates when sales were made.

The CHAIRMAN. Will you state that again in detail, giving the amounts of each item, the expenditures, and the receipts. To begin with, on what page of your report does it appear?

Mr. GRAVES. On page 5 of the annual report. The largest returns were from grazing, \$2,609,169.85. From timber sales, \$1,540,099.96.

Mr. JONES. What do you call that; timber sales—timber business?

Mr. GRAVES. Timber business.

Mr. JONES. The Government is not manufacturing lumber itself?

Mr. GRAVES. No, sir.

Mr. JONES. It sold that stumpage?

Mr. GRAVES. Yes, sir.

Mr. JONES. It would be timber sales?

Mr. GRAVES. Yes, sir; timber sales. There may be involved in that some timber trespass; that is, some moneys that come in from the taking of trees, or cutting over the line, or from burning by fire.

For special uses of land, like the use for summer homes, and for a great variety of other purposes, \$136,822.99. For water power, \$72,322.06.

Mr. McLAUGHLIN of Michigan. That is, for leases of sites for water power,

Mr. GRAVES. Yes.

Mr. JONES. You have no power developed?

Mr. GRAVES. No, sir. Those are the items that make up the total of \$4,358,414.86.

The CHAIRMAN. What are the expenses?

Mr. GRAVES. The total expenditures? Would you like this for the national forests?

The CHAIRMAN. The cost of the service?

Mr. GRAVES. The cost in connection with the national forests for the work outside of Washington, \$4,801,794. That includes the items in the regular appropriation bill for improvement work and various other items that represent a capital rather than an operating charge.

Mr. JONES. Have you got that itemized so that you could classify it as to grazing, timber sales, and other sources of your receipts?

Mr. GRAVES. The cost of it?

Mr. JONES. Yes.

Mr. GRAVES. Yes; though we gave up two years ago our detailed cost accounting system on account of the losses from our force, so that some of the items have to be estimated. That can be obtained only by classifying the time of our permanent officials, but I can give you approximately the cost of the different lines of work.

Mr. GRAVES. I will have to take it from our books.

The CHAIRMAN. You have not the total cost?

Mr. GRAVES. No, sir. I will have to insert the exact items in the text of the hearings.

(The statement referred to follows:)

Expenditures of the Forest Service during the fiscal year ending June 30, 1919.¹

Regular expenditures from annual appropriation:

Field expenses connected with the national forests-----	\$4, 801, 794. 67
General expenses connected with the Washington office-----	472, 403. 22
Research and recording of results-----	388, 023. 68
Total -----	5, 662, 221. 57
Emergency fire expenditures, derived in 1919 from the national security and defense fund-----	650, 000. 00
Cooperative contributions for work on national forests, including protection, improvements, and brush burning-----	522, 840. 05
Cooperation with States in fire protection outside the national forests-----	99, 921. 13
Cooperative contributions from Army and Navy for military research in wood-----	374, 233. 81
Construction of roads, from the 10 per cent fund (total available, \$350,533.75)-----	279, 055. 63
Construction of roads, section 8, Federal-aid road act and Post Office appropriation act (total available, \$4,000,000)-----	548, 764. 80
Amount paid to States, representing 25 per cent of gross receipts-----	1, 069, 886. 88
Special apportionment for Arizona and New Mexico for school lands within national forests-----	78, 687. 32

The CHAIRMAN. Does that include what you paid for the building of roads and the amount paid to the States?

Mr. GRAVES. Yes.

The CHAIRMAN. Including expenditures paid to the States for the building of roads?

Mr. GRAVES. That is taken out of our receipts.

The CHAIRMAN. Is there any amount to be deducted from the \$4,358,000 realized from receipts?

Mr. GRAVES. Yes, sir.

The CHAIRMAN. Then it is not taken out?

Mr. GRAVES. It is taken from our receipts—a percentage of our receipts. It is essentially an appropriation from Congress.

The CHAIRMAN. Is that to be deducted from the amount you gave as the total receipts or added to it?

Mr. GRAVES. No; added to the expenditures.

The CHAIRMAN. So that the \$4,358,000 does not represent the actual receipts?

Mr. GRAVES. Not the net, but the gross receipts.

The CHAIRMAN. There is to be deducted, then, the amount paid for the building of roads and the amounts paid to the States for schools?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. It is about 45 per cent, is it not?

Mr. GRAVES. It is about 45 per cent.

Mr. McLAUGHLIN of Michigan. Those items are to be deducted and added to the expenditures?

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. Of that \$4,000,000, only 55 per cent of it goes into the Treasury of the United States?

¹ This is from statement of Aug. 30, 1919. Some bills are still outstanding.

Mr. GRAVES. Only 55 per cent remains there.

Mr. McLAUGHLIN of Michigan. It goes to the receipts?

Mr. GRAVES. Yes.

The CHAIRMAN. Then the net would be somewhere about \$2,500,000?

Mr. GRAVES. Yes.

Mr. JONES. How do the States get that fund for the schools?

Mr. GRAVES. By the act of May 23, 1908, 25 per cent of the gross receipts was appropriated to the States for distribution among the counties for schools and roads, in lieu of taxes, for the Government does not pay taxes; and then, later, an additional 10 per cent was appropriated for the building of roads in the national forests under our direction. Then when the Federal aid road act was passed it was provided that an additional 10 per cent should be used for the liquidation of amounts devoted to national forest roads.

Mr. JONES. If it had not been done that way, it would have required an additional appropriation to do it, would it not?

Mr. GRAVES. Yes.

Mr. HUTCHINSON. The States, then, do not appropriate any money toward maintaining the forests?

Mr. GRAVES. No, sir.

Mr. LEE. With your permission, Mr. Chairman, I would like to ask Col. Graves a question or two before he leaves this item. I just wanted to ask you, in connection with the matter of receipts from the timber sold: Did you get credit for the timber that was shipped from Alaska and also that which was used in the war?

Mr. GRAVES. Credit only by an announcement in the annual report. It does not appear in the statement of receipts.

Mr. LEE. Are you not entitled to that?

Mr. GRAVES. There is a provision by which the Army and the Navy may secure timber from the national forests without paying for it.

Mr. LEE. Yes, but the national forests should have credit for that.

Mr. McLAUGHLIN of Michigan. There was objection to that. It was said that the national forests should get credit for it, but this was denied on the ground that the Army and Navy ought to have access to those resources.

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. It is a matter of bookkeeping, of course; but the Forest Service will never pay out if you give all the timber away.

Mr. JONES. I would take credit for it in the report, whether they gave it to me or not.

Mr. GRAVES. I have referred to that in our report.

Mr. JONES. What they took came from the stumpage under your jurisdiction?

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. They took it without paying for it, just the same.

Mr. JONES. I would take credit for it whether they gave it or not.

Mr. GRAVES. During the last year there were granted to the War Department, in connection with the spruce production in the Northwest, permits covering 6,000,000 feet, of which there were actually cut 3,750,000 feet. It was not a large amount.

In Alaska, permits were granted for the Alaskan Engineering Commission for cutting 5,758,000 feet of timber in connection with the construction of their railroad. That is also not a large item.

Mr. JONES. No. All those credits are not in these net receipts here?

Mr. GRAVES. No, sir.

Mr. JONES. They do show up in your report?

Mr. GRAVES. Yes.

Mr. JONES. Is it your hope some time to make this forestry bureau self-supporting?

Mr. GRAVES. I feel that in the long run it should be self-supporting, but I do not feel—

Mr. JONES. It depends on what latitude they will give you in cutting stumpage?

Mr. GRAVES. I do not feel that we should sacrifice the public interests merely in order to make it self-supporting.

Mr. JONES. No.

Mr. GRAVES. I do not think I could justify that. I do not think we should sell timber that would better be held for the uses of the country, by cutting it prematurely before it is really needed or before its cutting would be good economy from a lumbering standpoint or stumpage value.

Mr. JONES. But as a forester you believe that the forest should be trimmed; that mature trees should be cut down?

Mr. GRAVES. Mature trees should be cut and used. We have, of course, a great deal of mature timber. We have some which is deteriorating, but a great deal of it is remote. Perhaps in the course of five years (and certainly the timber will last five years) larger amounts will be needed, and the value of it will be greater than it is to-day.

Mr. McLAUGHLIN of Michigan. Mr. Jones has asked a question that has often been asked in these hearings and on the floor. I remember as long as 12 years ago a more or less distinguished gentleman connected with the Forest Service was asked how soon the forests would be self-sustaining, and, as I remember, he fixed the time at about five years. There were some then who questioned the wisdom of his estimate.

Mr. CANDLER. That was Mr. Pinchot.

Mr. JONES. Yes. His estimate was wrong.

Mr. GRAVES. We have, of course, a great deal of work which does not contribute anything to actual financial receipts. We have a great deal of work in connection with the adjustment of boundaries, the settlement of claims as to land, and work of that kind. That sooner or later will be finished. The work of improvement, outside of maintenance, is really a capital charge. The forests represent the remaining frontier of the country. If we go on developing them and building roads and so on, it will be some time before we can cover all the improvement charges by those receipts. The actual operating expenses are pretty nearly covered now by the receipts.

Mr. ANDERSON. Is the amount of stumpage you sell limited only by the policy of the department or of the Forest Service as to how much you will cut?

Mr. GRAVES. I could sell more timber to-day by making sacrificing prices and the adoption of a policy of dumping on the market;

but it would be unwise, waste our resources, and react in every way to hurt the public. In some of the forests there is a greater demand than I am willing entirely to fill, because, if I sold all that is demanded, it would lead to a gutting of the forests—such an overcutting that soon even local communities would not have at hand sufficient timber for their needs. We have a clear-cut policy not to overcut the forests. They should be a source of continuous production and not be wastefully exploited.

Mr. ANDERSON. Is not the amount of cutting about keeping pace with the local demand?

Mr. GRAVES. We do not yet cut up to the capacity of the forests. Our total amount of cut is less than one billion feet, and the capacity based on the rate of growth would be several billion feet. We are well within the limit.

Mr. JONES. I was going to ask you what comparison you made, if any, as to the increase in stumpage as against the fire destruction. How do they balance up?

Mr. GRAVES. There has not been any great marked increase in stumpage in the national forests on an average. In some of our more accessible areas the stumpage has shown a marked increase.

Mr. JONES. I am not speaking of price now but of growth. You testified to serious losses of this stumpage which you have had by fire. Of course, if that is continued annually there is going to be a time when your stumpage is all gone.

Mr. GRAVES. Yes.

Mr. JONES. What do you figure as to the increase of stumpage in growth?

Mr. GRAVES. The increase of stumpage is greater than our loss by fire. It is probably greater, even this year, by from one to three billion feet. I am speaking of potential growth.

Mr. JONES. Yes.

Mr. GRAVES. In normal years it is even greater.

Mr. JONES. I am not conversant with the character of timber in the Northwest, and that is the reason I am asking for some information. Is it a quick-growing tree, as compared with timber in other parts?

Mr. GRAVES. On the Pacific coast the Douglas fir—the west-slope Douglas fir—is one of the most rapid-growing trees that we have; and on fairly good soil it has a possibility of growing 1,000 feet per acre per annum. That is compared with some of the Rocky Mountain forests, having a growth of probably not over 100 feet. I refer to very slow-growing lodgepole pines and Rocky Mountain Douglas fir.

Mr. CANDLER. Could you make an approximate estimate of what your receipts were this fiscal year compared with what they were last fiscal year?

Mr. GRAVES. During the current year our timber sales are running so far about \$175,000 ahead of the same period last year. It is very difficult to tell in advance just what the situation will be by the end of the year. I think, however, that we will have to cut possibly 800,000,000 feet, and that will possibly increase the timber-sale receipts to the extent of \$200,000 to \$250,000. There may be a slight decrease in our grazing receipts, because we are taking off some of the war increase. In some places that were overgrazed we

are taking off some of the stock, and in some places in the West the drought was so severe last summer that the stock was taken out of the country and it has not been restored.

Mr. CANDLER. Your receipts this year are considerably increased, though; over what they were last year?

Mr. GRAVES. Yes; there is some increase this year.

Mr. CANDLER. And, as the regular increase comes, year after year, you will approximate making the national forests self-sustaining?

Mr. GRAVES. I think as our timber business increases—that is the greatest potential source of revenue—we should be able to cover all of the operating costs and all nonincome-producing activities, such as surveys of boundaries, mapping, and so on, and maintenance of improvement, but perhaps not the building of roads, which is really a separate matter and a capital charge.

The CHAIRMAN. Your books have been closed for last year. What was the deficit in dollars and cents last year?

Mr. GRAVES. For the Forest Service, outside of the road building and not including the extraordinary expenses for the emergency force, it is about \$1,500,000. That is, our appropriation was slightly under \$6,000,000 last year and our receipts were nearly \$4,500,000. This includes, of course, many expenditures wholly outside the national forests, such as research, our laboratories, cooperative work, and Washington overhead.

Mr. CANDLER. I think you have done well, and I would be glad if you would insert the figures for three or four years back, showing the continually increasing benefit derived, so that we may be able to show on the floor of the House the good business you are doing.

Mr. McLAUGHLIN of Michigan. When you are extending your remarks will you itemize your receipts and take the average price per thousand of timber sold, the number of sales, the different charges for the grazing, the number of permits, and, if you have the information, give a comparison between your charges for grazing and the charges by private owners of land? There has been some question and some criticism on the floor occasionally as to charges that you make; that they are either too high or too low as compared with charges made by private parties.

Another thing, questions are asked and there are criticisms as to your treatment of settlers as to timber and grazing privileges for themselves. Will you kindly put in something brief but to the point as to your treatment of settlers, the allowance that is made to a settler for his own use as to timber and as to grazing, to show that you do, as I believe you do, treat the settlers fairly?

Mr. GRAVES. Yes. That can be readily tabulated, as we have the tables which show that clearly.

The CHAIRMAN. Also give the amount paid for road building and everything in detail so that we can furnish specific information if called upon to do so.

Mr. GRAVES. Yes, sir; I have that.

Mr. McLAUGHLIN of Michigan. Can you also put in something regarding your plan for making charges in connection with summer resorts, as you have termed them, and your plan for charging for water-power sites?

(The various statements referred to follow:)

Summarized statement of receipts from the national forests, fiscal year ending June 30, 1919.

Timber sales	\$1, 503, 367. 37
Timber trespass and settlement	17, 562. 15
Turpentine sales	13, 220. 08
Turpentine trespass	691. 88
Grazing permits:	
Cattle, horses, and swine	1, 607, 006. 85
Sheep and goats	949, 955. 35
Grazing trespass	52, 207. 65
Special uses:	
Water power	72, 322. 06
Occupancy of lands	136, 112. 56
Occupancy trespass	689. 43
Fire trespass	5, 258. 48
Property trespass	21. 00
Total	4, 358, 414. 86

Comparison of receipts, 1910 to 1919.

Net receipts, fiscal year—	
1910	\$2, 041, 181. 22
1911	1, 968, 993. 42
1912	2, 109, 256. 91
1913	2, 391, 920. 85
1914	2, 437, 710. 21
1915	2, 481, 469. 35
1916	2, 823, 540. 71
1917	3, 457, 028. 41
1918	3, 574, 930. 07
1919	4, 358, 414. 86

STUMPAGE PRICES DURING THE FISCAL YEAR ENDING JUNE 30, 1919.

There were sold about 773,209,000 feet, board measure, of timber on the national forests, with an average stumpage value of \$2.35 per thousand. This represents a range of from 50 cents a thousand for the less valuable species in the more remote sections to over \$7 per thousand for the better and more accessible timber.

Timber cut under sales, fiscal year ended June 30, 1919.

COMPARISON OF GRAZING FEES CHARGED UPON THE NATIONAL FORESTS WITH CHARGES FOR EQUIVALENT PRIVILEGES ON OTHER LANDS IN THE SAME GENERAL LOCALITY.

Data secured in 1915 upon 900 separate transactions, involving the use of Indian reservations, Reclamation Service withdrawals, and State, railroad, and private lands for granting purposes, demonstrated that the charge for grazing cattle and horses within the national forests was only one-third and the charge for sheep and goats only two-fifths of the charge for the lands above mentioned. The lands leased were located mainly within or near the national forests and the character of the range was much the same.

The average charge per head of stock per month was as follows:

	National forests.	Other lands.
	<i>Cents.</i>	<i>Cents.</i>
Cattle.....	3.9	11.7
Horses.....	5.2	15.7
Sheep.....	1.4	3.6

Upon the basis of these data, the charge for grazing upon the national forests was doubled, it being conceded that the prevailing conditions justified a reduction of one-third from the prices paid for the use of private lands where greater freedom was enjoyed in the use of the land and the tenure of the lease was more certain.

STATEMENT OF NUMBER AND CHARACTER OF SPECIAL-USE PERMITS, NUMBER OF CHARGE PERMITS, NUMBER OF FREE PERMITS, BASIS OF CHARGES, SCALE OF RATES FIXED BY REGULATION, AND TOTAL RECEIPTS FROM SPECIAL-USE PERMITS.

At the present time there are outstanding 23,878 special-use permits authorizing the use of national-forest lands for various purposes. Twelve thousand two hundred and five of these are issued without charge, and for 11,673 a charge is made. Among the purposes for which free permits are granted are the following: Agricultural use of lands where the user has a preference right of entry under the forest-homestead law; for schools, churches, and cemeteries; cabins for the use of miners, prospectors, stockmen in connection with grazing permits; trappers of predatory animals; corrals, stock tanks, shelters, and drift division, or other fences required for the proper management of a special-use permittee's stock where the permittee does not get control of range to the exclusion of other stock entitled to its use; dipping vats where no toll is charged; saw mills sawing principally timber obtained from the national forests; conduits, dams, reservoirs, pumping stations, or any water-development project for watering stock, irrigation, mining, municipal, or domestic water supplies; roads and trails, logging railroads, flumes, tramways, inclosures, and other improvements necessary to the manufacture of timber obtained principally from the national forests; telephone lines where the free use of the line is given the Forest Service in connection with the administration of the forest; telegraph lines where the Forest Service has a free permit to string telephone lines on the telegraph poles; sewage systems; fish hatcheries; and public uses by any department or branch of the Federal or State Government, including municipalities, where no profit is to be derived from such cases.

In making a charge for permits the charge is based upon a fair ground rental of the area involved, taking into consideration the purposes for which the land is used. Accessibility is an important factor. A resort site at a high elevation where climatic conditions prevent its use for nine months each year, other conditions being the same, is charged a lower rental than a site which is used for a longer period. For the guidance of forest officers in making charges on the principal uses, the following schedule has been authorized by regulation:

Kinds	Rates per annum.	Explanation.
Agriculture and cultivation.	25 cents to \$3 per acre. Not less than \$2 for any permit.	Not to exceed 160 acres to any one permittee. (Free to preferred applicants under the act of June 11, 1905.)
Apiaries.....	Minimum \$10, and 10 cents per hive for each hive over 100.	1 to 3 acres. Hives to be counted in April and payments due May 1 each year. Proportionate charges made for fractional years.
Barns, garages, and stage stations.	\$5 to \$25, and up.....	2 acres or less (stage stations without hotel features).
Dipping vats (toll vats)...	\$10 to \$20, and up.....	2 acres or less. (See (f) Reg. L-32.)
Fish hatcheries (commercial).	\$10 to \$50, and up.....	2 to 40 acres. (See (p) Reg. L-32.)
Gravel.....	5 cents to 10 cents per cubic yard, not less than \$2 for any permit. Special rates on area basis.	(See (n) Reg. L-32.)

Kinds.	Rates per annum.	Explanation.
Hay cutting.....	25 cents to \$2 per acre. Not less than \$2 for any permit.	1 to 10 acres. Not to exceed 5 acres under term permits.
Hotels and resorts.....	\$25 to \$250, and up.....	1 acre.
Limekilns.....	\$10 to \$25, and up.....	1 acre.
Oil and gas pipe lines.....	\$5 per mile or fraction thereof. No permit less than \$5.	
Pastures.....	4 cents to \$1 per acre. Not less than \$2 for any permit.	Not over 320 acres to any one permittee. ¹ (Charge is in addition to regular grazing fee.)
Railroad and trolley lines..	\$5 per mile or fraction thereof. No permit less than \$5.	(See (k) Reg. L-32.)
Residences.....	\$5 to \$25.....	½ to 5 acres, depending on local conditions.
Sawmills.....	\$10 to \$200, and up.....	1 to 10 acres. (See (h) Reg. L-32.)
Slaughterhouses.....	\$10 to \$25, and up.....	1 to 3 acres.
Stores and similar enterprises.	\$10 to \$50, and up.....	½ to 5 acres, depending on local conditions.
Tramways (aerial).....	\$5 per mile or fraction thereof. No permit less than \$5.	(See (k) Reg. L-32.)
Theaters, billiard halls, bowling alleys, etc.	\$10 to \$50, and up.....	½ to 5 acres, depending on local conditions.

¹ The limit of 320 acres for pastures shall be observed in all cases except where the applicant holds a permit to graze more than 200 head of cattle or their equivalent in other stock, in which case an area of 1 acre for each head of stock in excess of 200 may be allowed; provided, however, in Arizona and New Mexico 320 acres may be allowed for 100 head of permitted cattle or their equivalent in other stock, and 2 acres may be allowed for each head in excess of 100.

It will be noted that the minimum, and in some instances the maximum, charge is fixed. Particularly is this true with respect to agricultural uses and summer-home uses. As to the latter, it is considered desirable to promote this use and, therefore, to assure the permittee at the time he makes his improvements what the maximum charge may be.

The total receipts from such permits or leases for the fiscal year ending June 30, 1919, amounted to \$136,112.56.

SPECIAL PRIVILEGES GRANTED TO SETTLERS AND HOME BUILDERS IN OR NEAR THE NATIONAL FORESTS.

Free use of timber.—Under authority of the law providing for the creation of national forests, the Secretary of Agriculture has issued regulations providing for the free use of timber by settlers and home builders in the vicinity of the national forests. During the past fiscal year timber having a value of \$113,117 was given away under these provisions. Usually the settler is limited to \$20 worth of timber for his own use each year. Under somewhat similar provisions of law settlers may take for their own use not to exceed \$50 worth of timber from public lands outside the national forests.

Saw timber at cost.—Under the provisions of special legislation, the Secretary of Agriculture is directed to sell at cost to homestead settlers and farmers, for domestic use, timber in any quantity. Where the settler has already obtained his quota of free material for the year, or wishes timber of a character not obtainable under free use, he may purchase it under this regulation. The average cost to the settler is about 75 cents per thousand feet board measure, or 25 cents per cord. The value of timber sold at cost to settlers under this law during the year ending June 30, 1919, was \$42,276 greater than the amount actually received by the Government.

Free grazing of milch or work animals.—Under the Forest Service regulations milch, work, or other animals used for domestic purposes, not exceeding a total of 10 head, owned and in use by bona fide settlers residing in or near a national forest, require no permit. In addition, no charge is made to the settler for the privilege of driving his stock across national forest lands in order to reach his own holdings. The aggregate number of animals thus grazed entirely free of charge amounts to about 150,000 head.

Settlers given preference in issuing grazing permits.—In the issuance of grazing permits first preference is given to settlers in or near the forest. If he is a new settler and the forest is already stocked, the larger permittees are reduced in order to make room for him, and all men in this class are allowed to build up their herds to a reasonable protective limit, proper reductions being made in other permittees to permit such increases. The settler

within the forest is, under certain conditions, permitted to enclose adjoining national forest land in order to secure protection in the use of near-by range. For this privilege an acreage charge is made, but the permittee thereby secures a valuable special advantage over other stockmen not so fortunately situated.

Free water and free ditches.—Under special legislation settlers in or near the forest have the right to construct and maintain, free of charge, irrigation dams, reservoirs, and ditches over and through national-forest land or public land. The acreage of forest land so used is considerable, and the ditches run into thousands of miles. The values involved run into the millions.

Free use of roads, trails, and public-service conveniences in the national forests.—The act authorizing the creation of the national forests provides specifically that they shall be at all times open to free access to everyone in pursuit of lawful purposes. A great deal of money has been expended by the Federal Government in the construction of roads, trails, and bridges within the national forests. These are, of course, free to everyone, but, after the Government, the local settler is the chief beneficiary. In addition, so far as it can be done without interfering with Government business, the Forest Service has placed its telephone facilities at the service of the local public. Sometimes no charge is made on account of cooperative service rendered. In other instances the charge is nominal. In either event the saving in time and labor to the settler is very substantial.

Basis for the foregoing privileges.—It will be seen that the free use of timber, the sales of saw timber at cost, free use of land for irrigation reservoirs, free rights of way for ditches, and free use of roads, trails, and bridges have all been specifically authorized by Congress. The limited amount of free-grazing permitted settlers and the liberal policy in the use of telephone facilities are based upon regulations and instructions which are believed to be in harmony with the policy Congress desires to pursue toward settlers, as expressed in the foregoing provisions. Considering the hardships and privations which are, under most favorable conditions, encountered by the homemaker, it is believed that a liberal policy is both wise and necessary.

BASIS OF CHARGES FOR THE USE OF WATER-POWER SITES.

It has been the primary purpose of the Forest Service in collecting rental charges for those national-forest lands which are used for the purposes of power development to reimburse the Government both for the costs incurred in administering the water power business and for such share of the general costs of administration, protection, and improvement of the national forests as might reasonably be assigned to this class of use. The basis upon which the charges are collected is the "power capacity" of the site; that is, the number of horsepower which can be continuously produced by plants so designed and constructed as to make the best practicable utilization of the site under the physical conditions which exist at the site and under the market conditions which exist in the district to be supplied. Such a method determines the relative value of different sites rather than the actual commercial value of any particular site.

The rate of charge begins at 10 cents per horsepower per annum and increases by annual increments of 10 cents per horsepower to a maximum of \$1. The total collected for the fiscal year ending June 30, 1919, was \$72,322.06. This amount represents an average of approximately 25 cents per horsepower capacity of the sites now developed. Since only a small proportion have been in operation long enough to pay the full charge of \$1 per horsepower, the annual receipts would increase for several years to come even if no new plants were put into operation.

When permits are issued for transmission lines only the charge is \$5 per mile per annum. No charge is made for projects of 100 horsepower capacity or less, for those which are used exclusively as auxiliaries to irrigation works owned and operated by the permittee, or for those developed and operated by municipalities for municipal purposes. For both these last-named classes the Forest Service is following the policy laid down by Congress in the acts of 1891 and 1905, under which easements for irrigation and municipal works may be obtained free of charge.

The Forest Service has adopted the above practice for two reasons: First, it has believed it more desirable in the public interest that the unused water powers should be developed and put to use than that revenue should be secured for the

Federal Treasury. Hence, instead of making charges which would be passed on to the consumer in higher rates for power purchased, it has made requirements which would result in direct benefit to the ultimate users of power, such, for example, as complete development of site, continuous operation of plant, maintenance of an approved accounting system, submission of rates and of conditions of service to regulation by public authority, and sale upon application and upon a reasonable valuation to any State or municipal agency having authority to acquire and operate power plants. Second, the Forest Service has never been in a position to employ a force and to incur the expense which would be necessary if the rentals to be charged were to be determined upon the basis of returning to the Government the actual commercial value of each individual site under permit. Moreover, from the trend of public discussion during recent years, both in Congress and outside, it apparently is the desire that our water powers should be developed as rapidly and as extensively as possible, and it is believed that a policy of disposing of them primarily for revenue purposes would seriously interfere with such development.

The CHAIRMAN. We will take up grazing charges next.

MR. GRAVES. I will ask Mr. Potter to discuss that phase.

The CHAIRMAN. We will be pleased to hear Mr. Potter.

STATEMENT OF MR. A. F. POTTER, ASSOCIATE FORESTER, FOREST SERVICE, DEPARTMENT OF AGRICULTURE.

MR. POTTER. Mr. Chairman, the average rate for cattle grazing this year is \$1.20 a head for the entire year. Where the grazing is for only a few months the rate is one-tenth of the annual rate per month. The average period during which cattle have been on the forests this year is six months, so that the average amount collected is 72 cents per head. The sheep rate is 25 per cent of the cattle rate.

The CHAIRMAN. What did you say the average rate was?

MR. POTTER. Seventy-two cents per head for six months. The sheep rate is 25 per cent of the cattle rate. The average period the sheep have been on is about four months, so that the average fee collected from sheep grazing is about 12 cents per head.

The CHAIRMAN. How about horses?

MR. POTTER. We charge 25 per cent more for horses than for cattle, and the time that they are on the forest is about the same as for cattle, so that the average rate collected for horses would be about 90 cents per head.

The CHAIRMAN. Those are the only ones?

MR. POTTER. Yes, sir; the number of swine is very small, so that that doesn't cut much figure. Before the forests were turned over to the Forest Service, and on the public lands before they were included in the forests, no charge was made for grazing, and grazing is allowed free on the public lands yet. So that at first, in fixing the charge for grazing, only a nominal rate was charged which would be sufficient to reimburse the Government for the cost of administration and protection of the ranges. In the first few years a rate was established which averaged 48 cents per head per annum for cattle. This was gradually increased to an average rate of 60 cents in 1916. It was felt as the management was improved and time went on that we should get a return commensurate with what it was actually worth; so during the years 1915 and 1916 a very careful study was made of the charges for grazing on other lands similar in character to those within the national forests, such as railroad lands, State lands, and lands in private ownership. The result was to find that the average rate paid for grazing on these other lands was about three times what we were charging on the national forest lands.

But there are restrictions in the use of the national forest lands which make them not worth as much as the grazing on private lands. To begin with, the permits are all revokable without notice. In case damage is being done to the forests we reserve the right immediately to cancel the permit and remove the stock.

Mr. McLAUGHLIN of Michigan. Do you find it necessary to do that in very many cases?

Mr. POTTER. It isn't necessary to do that very often during the season, but frequently at the end of a season. We require the stockmen to cooperate with us in fire fighting, in the construction of improvements, and things of that sort.

Mr. McLAUGHLIN of Michigan. What do you mean by cooperating with you in fire fighting? Do you make them join your forces and fight the fire without pay?

Mr. POTTER. We make them join our forces without pay in many instances. If we retain them any length of time on that kind of work we remunerate them the same as others, but where it is merely temporary assistance, for a day or two, there is no compensation.

In addition to the uncertainty regarding tenure of the permit, because it is revocable without notice, there are other features which in the estimation of the stockmen lower the value of the grazing privileges in comparison with those on private lands. First of all, the number of stock is restricted to the number which in the opinion of the forest officers may be grazed without damage to the forest, which is often a smaller number than would ordinarily be placed upon private lands. Again, it is often necessary to shift stock from one part of the forest to another or even from one forest unit to another. The Forest Service reserves the right to make such changes from year to year. Naturally, a stockman wishes to use the same range year after year. Important also are the restrictions relating to the time when stock is allowed to enter the forest and the dates when the animals must be removed. Such restrictions are necessary not merely in order to protect the range but also to prevent injury to the forest and to watersheds. Still again, the permits are subject to reduction from year to year to make room for new applicants, particularly for settlers who live near the national forests. These reductions apply primarily to the larger permittees.

For the matter of improvements the stockmen pay for a great many themselves. On the whole, it was considered that the restrictions which were placed upon the grazing of stock on the forests reduced the value about one-third below the rate charged on other lands. So the announcement was made in 1917 that the rates on the national forests would be doubled. That naturally brought a protest, and Secretary Houston gave full hearings to representatives of the live-stock associations, both last winter and the winter before. The final result was a decision that for 1918 only a 25 per cent increase over the former rate would be made and that further study would be made of the matter. This was done, and for 1919, this year, the charge proposed having been found to be justified, double the former rate was charged; so there is an increase in receipts of \$883,347.91 over what was collected in 1918.

Uncertainties in regard to the charges for grazing privileges have tended to unsettle many persons in the stock industry, particularly smaller men, who hesitate to assume obligations in improving ranch

property—in other words, in building up their business—when there is likelihood of sudden changes in the rate of charge. To reduce these uncertainties, announcement was made that it would be the policy to make readjustments periodically—in five-year periods rather than from year to year. In addition, where the conditions on the forest are sufficiently settled as to the number of stock which can be allowed without injury to the forest or watersheds the issuance of five-year permits was authorized, and permits have been issued on this basis to a large portion of the permittees. These permits require the payment of a like amount in fees during the five-year period, but the permittees have been informed that at the end of this period the rates will be adjusted, either up or down, in accordance with values at that time.

It is not contemplated that there will be any change in the base rate up or down between now and 1923. In view of the fact that we crowded the national forest ranges to the limit last year in order to take care of all the stock we possibly could as a war emergency, we do not contemplate that there is any probability of increasing the number of stock within the next few years, and therefore do not look for any material increase in the receipts from grazing. The amount collected this year was \$2,609,169.85. That will be about the amount we may expect to get from the grazing next year.

The CHAIRMAN. Do you consider the fee charged a reasonable one?

Mr. POTTER. Yes, sir; the fee, in my opinion, is reasonable.

The CHAIRMAN. Should more be charged?

Mr. POTTER. In the long run, yes; as the value of the ranges are increased through improvements.

The CHAIRMAN. I am speaking of the present rates. Are they not too low at the present time?

Mr. POTTER. Of course, there has been a very marked increase in the value of the leases on private grazing lands in the past two years due to war conditions and the drought. If our fees were to be based on the present exceptionally high values, they are too low.

The CHAIRMAN. I understood you to say the charges had been increased materially.

Mr. POTTER. Yes, sir; they have. That was based——

The CHAIRMAN. How much?

Mr. POTTER. They are double what they were in 1916.

The CHAIRMAN. They average about twice what they used to?

Mr. POTTER. Yes, sir.

The CHAIRMAN. They average about 72 cents now?

Mr. POTTER. Yes, sir.

The CHAIRMAN. They have been increased about 36 cents?

Mr. POTTER. Yes, sir; since 1916.

The CHAIRMAN. The average price of cattle has increased, say, from \$40 to over \$100, has it not? That depends on the ages of the cattle, of course; but a steer then selling for \$40 is now worth at least \$100.

Mr. POTTER. Probably so; putting it on a range cattle basis, they have increased from a value of about \$30 to about \$50 or \$60 per head.

The CHAIRMAN. In my section of the country the cost of pasture has increased about \$2.50 to \$8 a head.

Mr. POTTER. Yes, sir. I presume you refer to the cost of summer pasture.

The CHAIRMAN. Do you consider that the present charge is a fair one? Pasturing in my section of the country covers only about five or six months, whereas in the western range section of the country it is 12 months, and if less than 12 months deduction is made.

Mr. POTTER. If the present prices are continued it would be very much less than we should get.

The CHAIRMAN. Are you getting what it is worth at the present time?

Mr. POTTER. Not on the basis of the present inflated prices.

The CHAIRMAN. Why do you not get what it is worth? Who determines this?

Mr. POTTER. We are trying to stabilize range conditions and do not believe the fees should be readjusted on the basis of the present abnormal conditions.

The CHAIRMAN. You were speaking about the fee charged on private lands. Do you fix the price for private lands as well as your own?

Mr. POTTER. No, sir.

The CHAIRMAN. They follow your price?

Mr. POTTER. Decidedly not.

The CHAIRMAN. Are there any cattle grazing on privately owned lands?

Mr. POTTER. Yes, sir.

The CHAIRMAN. Any considerable number?

Mr. POTTER. Yes; there is a very considerable number.

The CHAIRMAN. Who owns the land?

Mr. POTTER. They are owned by the individual stockmen, the States, and the railroad companies.

The CHAIRMAN. If they own the land they do not pay any grazing fee, do they?

Mr. POTTER. That is true; they pay the taxes on the land and things of that kind.

The CHAIRMAN. But where a fee is paid?

Mr. POTTER. Where they lease the land to other parties—

The CHAIRMAN. Is there much leasing of lands to other parties?

Mr. POTTER. I have no data on the acreage.

The CHAIRMAN. You say considerable amounts?

Mr. POTTER. Yes; there is a considerable amount. How many million acres I do not know.

The CHAIRMAN. There are large tracts held by individuals?

Mr. POTTER. I don't know of any that you would call very large tracts, except in Texas; of course, that is all under private ownership.

The CHAIRMAN. That isn't in forests. We are speaking of the western country.

Mr. POTTER. The areas which are leased are comparatively small, with the exception of some of the land grants in New Mexico.

Mr. HUTCHINSON. You said the States lease theirs. What do they charge?

Mr. POTTER. They are usually leased on an acreage basis. They usually charge about 5 to 6 cents an acre. Last year the State of Arizona leased 6,000,000 acres at an average rental of 3½ cents per acre; New Mexico leased 9,600,000 at an average of 6 cents; and Colorado, 2,000,000 acres at an average of 10 cents per acre.

The CHAIRMAN. How many acres to a head?

Mr. POTTER. The average would be about 30.

The CHAIRMAN. That would be \$1.50.

Mr. POTTER. About \$1.80, at the rate of 6 cents.

The CHAIRMAN. For cattle?

Mr. POTTER. Yes, sir.

The CHAIRMAN. That would be about three times as much as you are charging.

Mr. POTTER. About twice as much, if the land was used for only six months.

The CHAIRMAN. Or a little more than double?

Mr. POTTER. Yes.

The CHAIRMAN. Why are you not entitled to as much as the States?

Mr. POTTER. It is just the difference in the use of the land. The States, as a rule, place no restrictions whatever in the handling of the stock on their lands. They allow the stockmen entire freedom as to the way the stock shall be handled.

The CHAIRMAN. Do the States make restrictions as to the number that shall be put on a given area?

Mr. POTTER. Not that I know of. They simply leave it to the stockmen to use the land in accordance with their judgment.

The CHAIRMAN. You said your rates were based on the rates charged by private individuals, and then you said that no considerable amount was being leased to other parties. Why is that a fair basis to be used in making your charges?

Mr. POTTER. Our charge was based on the prices paid on about 3,800,000 acres of lands of similar character to those in the national forests, the greater part of which was owned by the States and the railroad companies.

The CHAIRMAN. It should be based upon good judgment and common sense, what is fair and right.

Mr. POTTER. Certainly.

The CHAIRMAN. Upon investigation, do you believe you are charging what it is worth at the present time?

Mr. POTTER. We are not charging the full present market value.

The CHAIRMAN. What is, in your judgment, a fair reasonable charge? You charge, according to your statement, about \$2.26 for grazing for three years a steer that sells for over \$100.

Mr. POTTER. I consider that we have been handling this in the right way. If, however, the values arising from the present abnormal conditions are to be the basis of charge, of course the present fees would be doubled.

The CHAIRMAN. Congress has been criticized for not charging a reasonable fair rate for grazing. The present rate does not seem to me fair and just; it seems to me that the rate of \$2.26 for grazing for three years a steer that sells for over \$100 is not a fair and reasonable charge. I appreciate also that you do not have full jurisdiction over the matter probably others have determined what the rate shall be. I do not bring this up here to embarrass you or anybody else in the department, but we ought to have the facts as to the amount charged and an estimate as to what would be a reasonable, fair charge.

Mr. POTTER. The establishment of an equitable charge for the grazing privileges must take into consideration the entire public objectives of the national forests and their use. In the beginning no charge at all was made. The stockmen had always enjoyed free use of the public grazing lands and still are allowed to use those outside the national forests free of charge and without restriction. There had been abuse of the lands by overgrazing and many serious conflicts between the owners of different kinds of stock. When the Forest Service took charge it undertook to correct these evils. The number of stock allowed on each range was limited to what could be grazed without damage to the forests or watersheds, and in making the necessary reductions the cuts were made on the permits of the larger owners. The range was divided fairly between the owners of cattle and sheep and, so far as possible, each was allowed to use those portions best adapted to his kind of stock. This was no easy job, as it involved not only the settlement of hundreds of controversies but satisfying the people that they had been settled right. There also has been a constant demand from new settlers for a share in the grazing privileges. More than 10,000 such applications have been approved during the past six years. We are now protecting 30,000 small owners in the use of the range needed for the maintenance of their homes and giving them a preference in renewal of permits. The large owners were occupying the range when we took charge and their permits are being gradually reduced. We have encouraged the stockmen to adopt systems of management which would improve the range conditions and through the organization of over 400 local live-stock associations have secured their hearty cooperation. We have felt that stopping damage to the forests, improving conditions on the watersheds, bringing about orderly use of the ranges, and protecting settlers in establishing their homes was of more importance to the Nation than the number of dollars collected in fees, and I believe that this should continue to be our ideal.

The CHAIRMAN. Thank you, Mr. Potter. We will now recess.

(Thereupon, at 5 o'clock p. m., the committee recessed to meet Thursday, December 18, 1919, at 10 o'clock a. m.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, December 18, 1919.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. The committee will come to order. You may proceed, Mr. Graves.

FOREST SERVICE—Continued.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Mr. GRAVES. We are considering item 240, page 127, of the bill, "for the selection, classification, and segregation of lands within the boundaries of the national forests that may be opened to homestead settlement," and so on.

The CHAIRMAN. You suggest some new language there.

Mr. GRAVES. This is the authority which we have for the classification of lands, the location of agricultural land, and the determination of which lands ought to be permanently held in the forests. We also have authority, in the case of several forests, under special acts, to make exchanges of land with owners whose land lies interlocked with the national forest land. Such exchange legislation has already been enacted in the case of six forests.

We have now the authority to survey lands which are opened up for agricultural settlement. The new language is a request for similar authority to cover the exchange of land. An illustration of where this is needed immediately is in Florida. The Florida national forests are badly cut up with private holdings, due to an old railroad grant. This land has passed long since into individual ownership. Exchanges are needed to consolidate the Government lands into a solid body for better handling.

The CHAIRMAN. What does that exchange involve? Is one solid tract of land exchanged for another, or is it just small tracts here and there?

Mr. GRAVES. In portions of the Florida forest, half the land, the alternate sections, are owned privately, and we owned the other sections. Such a condition makes a very difficult problem of administration and protection. By effecting an equitable exchange, our lands can be consolidated in exchange for other lands on the basis of actual value.

The CHAIRMAN. The lands are to be appraised?

Mr. GRAVES. The lands have to be carefully appraised, the timber appraised, and an exchange worked out on a basis of equal values in accordance with the terms of the law. In many cases there are no surveys which can be accepted by the General Land Office, and title can't pass. The requested authority would enable our engineers to survey those lands under the general direction of the General Land Office and thus expedite the exchange.

Mr. McLAUGHLIN of Michigan. Mr. Graves, what check is there on that exchange; is there any except the honesty of your local inspector?

Mr. GRAVES. There are several checks in the field and finally a check in my office. In the first place, there is a field examination to determine the amount of timber by a careful strip cruise. The work is all checked up by several persons along the line, so that it is almost impossible not to have an honest check.

Mr. McLAUGHLIN of Michigan. The appraisal is made by the field appraisers and then it is checked in your office?

Mr. McKINLEY. With regard to this checking up, is it sent here to Washington to be checked up?

Mr. GRAVES. We first have our supervisory officers in the field make a check. There is usually a check estimate made from the angle of the logging engineer. Then all of the data, when they are assembled, are worked over by the timber-sales force in the district office and afterwards by the inspectors in my own office, so that it has as complete a check as we could give it within our organization without spending an undue amount of money.

Mr. McKINLEY. I am glad to hear you say that, as I was wondering whether it would be possible to have a collusion between the men in the service and the men who wanted to trade.

Mr. GRAVES. I doubt very much whether that would be possible. I think we have got about as thorough a check as is possible now.

Mr. VOIGT. Your estimates are made with reference to the timber on the land?

Mr. GRAVES. To get the timber and the valuation.

Mr. VOIGT. Do they go into the question of valuation extensively?

Mr. GRAVES. They determine the basis of the quantitative and qualitative values; then our logging engineers go in and check up the location, the cost of operating, what it would cost to build a railroad or other improvements, and thus arrive at the stumpage values.

Mr. VOIGT. But the transfer isn't based either on the amount of timber, or upon the country, but upon values?

Mr. GRAVES. It is based upon values.

Mr. VOIGT. In other words, you might have one tract of 100 acres that would be worth as much as another tract with a thousand acres?

Mr. GRAVES. Yes, sir.

Mr. VOIGT. In determining the value of the timber, you take into consideration the quality of the stumpage and also the cost of operations?

Mr. GRAVES. Yes; and the land itself in the different localities might have different values. Very rocky land in the mountain sections, at high elevations, certainly wouldn't have the value of lands down lower which have much productive soil.

Mr. VOIGT. The policy of your department, then, is not to make trades for the purpose of consolidating bodies, but rather to consolidate the holdings as a protective measure?

Mr. GRAVES. Particularly for the benefit of the public in having a solid body of land for the better protection of the timber, control of the use of the land, and for utilization of the resources.

Mr. VOIGT. You believe that this change in language is necessary for the purpose of allowing you to do that work?

Mr. GRAVES. We have the authority to make the exchanges on six individual forests now, but we have no authority to make actual surveys, which is the basis of the transfer of title.

Mr. VOIGT. How can you make changes without that provision?

Mr. GRAVES. Because some of the private lands are still held by the owners in units of the subdivisions of the public surveys. There it hasn't been necessary to make new surveys. But where there have been subdivisions cut up in two or three parts, there must be a new official survey. Otherwise you would have to wait until the General Land Office was able with its own organization to make the survey. This might be quite a long time. The new authority requested would expedite the passing of title.

The CHAIRMAN. Are these exchanges entirely within the forests or are there exchanges outside?

Mr. GRAVES. They are all within the boundaries of the forests, except in one where authority was given for going a short distance outside. In that case Congress designated certain areas within which exchanges could be made outside, but all others are within the boundaries of the forests.

Mr. McLAUGHLIN of Michigan. Do you mean that the law describes a particular piece of property that might be acquired?

Mr. GRAVES. No; it simply described a general area within which the exchanges may be made.

The CHAIRMAN. In how many cases were lands offered for exchange?

Mr. GRAVES. There have been a good many suggestions for exchanges, many of them in the forests where at the present time there is no legal authority for making them.

The CHAIRMAN. I have reference to these six forests.

Mr. GRAVES. Within the six forests we have made, as I recall it, five exchanges.

The CHAIRMAN. Are they large or small tracts?

Mr. GRAVES. They run from 160 acres to about 30,000 acres.

The CHAIRMAN. Is this being done in the interests of the forests?

Mr. GRAVES. Entirely for the interests of the forests.

The CHAIRMAN. Was that the purpose of the act?

Mr. GRAVES. The purpose of the act was to enable the consolidation of the forests where there is a large amount of interior holdings which makes protection and administration difficult and expensive.

The CHAIRMAN. I wish you would point out how appraisals are made.

Mr. GRAVES. Appraisals are made in much the same way as we appraise the timber for sale.

The CHAIRMAN. Is that done by your men?

Mr. GRAVES. By our own men.

The CHAIRMAN. They check up on that?

Mr. GRAVES. It is thoroughly checked up. I do not know how we could get it more thoroughly checked up without spending an undue amount of money.

Mr. McLAUGHLIN of Michigan. You may remember that last spring I asked you about an exchange proposition involving some outside property in California. Inquiry has been made of me about it; do you recall that?

Mr. GRAVES. Yes, sir; I recall it.

Mr. McLAUGHLIN of Michigan. Has anything been done about that? Is there any prospect of that being taken up?

Mr. GRAVES. That proposition was in connection with a national park.

Mr. McLAUGHLIN of Michigan. Yes.

Mr. GRAVES. That particular area which you had in mind comprised some redwood, on what is called the Redwood Mountain, within the Sequoia National Forest of California. It is proposed to establish a national park near there. There was a suggestion for acquiring this land from the private owners on Redwood Mountain with a view of adding it to the national park. Neither the Interior Department nor the Forest Service wishes to extend the boundaries of the proposed park as far west as Redwood Mountain, so that I think the question is not going to be raised.

Mr. McLAUGHLIN of Michigan. The status, so far as that land is concerned, is the same as when you wrote me and when I conferred with you?

Mr. GRAVES. Yes. We do not think that it is wise to make an exchange there.

The CHAIRMAN. What progress is being made as to the segregation of land within the boundaries of the forests?

Mr. GRAVES. The progress has been very rapid. Formerly the classification and the segregation of land for agricultural purposes was made primarily by individual tracts. Then we undertook to classify the forests as a whole. Where there were considerable quantities of agricultural lands such areas were eliminated from the national forests. They could then be occupied rapidly.

Mr. McLAUGHLIN of Michigan. There are two lines of that work, aren't there, Colonel; one where the application for patent is made, and another under the general law requiring you to make a general survey of the forests for the purpose of determining the lands more suitable within them for forests?

Mr. GRAVES. Yes, sir; we have expedited the first procedure by the second; that is, by classifying the lands and segregating them in bodies.

Mr. McLAUGHLIN of Michigan. There are still considerable to be classified?

Mr. GRAVES. Yes; but we have gone on with our classification so far ahead of the applications for individual tracts that the segregation is almost entirely taken care of through classification.

Mr. McLAUGHLIN of Michigan. Several years ago patentees, or those who wished patents, were held up. There was a delay, of which they complained, because the land could not be examined by your service, and the Interior Department would not act until it had a report from you.

Mr. GRAVES. The matter is being cleared up very rapidly through this classification and segregation of lands. Since we began our work of boundary examinations, eliminations and segregations amounting to some fifteen to twenty million acres have been made.

Mr. McLAUGHLIN of Michigan. Before you were authorized to examine it as a whole and make segregations, there were a great many pending claims for patents in the Land Office, and I recall that we were urged to recommend large appropriations for the employment of a large number of men to survey, because it was said that your service was lagging behind the Land Office; that difficulty has been overcome, has it?

Mr. GRAVES. There were a great many claims that had been initiated, before the establishment of the national forests, under the homestead, mining, and other laws. These have by this time pretty much been taken care of.

The CHAIRMAN. The surveys, then, are practically up to date; all of those lands have been segregated, and you are fairly up with the platting and surveying?

Mr. GRAVES. We are fairly up with the platting and surveying; we have classified about 125,000,000 acres. We still have something over 20,000,000 acres to examine, a portion of this area being in Alaska. We have, however, taken up first the areas in Alaska which present the best opportunities for cultivation, with the result that we have during the past year eliminated from the Alaskan forests approximately 300,000 acres of land, thereby taking care of the most important problems of agricultural settlement.

The CHAIRMAN. What number of acres have been segregated altogether?

Mr. GRAVES. We have classified about 125,000,000 acres and have eliminated in the national forests some fifteen to twenty millions acres.

Mr. McLAUGHLIN of Michigan. There is an appropriation for the Bureau of Soils under which you and the officers of that bureau cooperate; what do you do in that connection?

Mr. GRAVES. We ask the Bureau of Soils to help us in the classification work, particularly in connection with questions on the border line between absolute forest lands and obvious agricultural lands.

Mr. McLAUGHLIN of Michigan. The Bureau of Soils acts only upon your request?

Mr. GRAVES. They act only upon our request and assign experts who join our classification force in an advisory capacity.

Mr. McLAUGHLIN of Michigan. That is for the purpose only of ascertaining the quality of the soil and its suitability for agriculture?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. Grazing also; do you ask any aid on account of grazing?

Mr. GRAVES. That question is one that would be taken care of by our regular classification.

The CHAIRMAN. The full amount of this appropriation, \$107,000, will be required?

Mr. GRAVES. Yes, sir.

The CHAIRMAN. We will take up the next item.

Mr. GRAVES. The next item is on page 128, item 241—

For fighting and preventing forest fires and for other unforeseen emergencies, \$150,000.

We have had this item in the appropriation bill, I think, for 8 or 10 years. In 1911, after the great fires of 1910, we requested the committee to give us an emergency appropriation of \$1,000,000 in addition to the item of \$150,000. This was done. The following year the \$150,000 sufficed to meet our needs, and the emergency appropriation was cut down to \$200,000. The year after that the season was again favorable and there was practically no need for drawing on the additional emergency. Congress then cut down the item still further, to \$100,000, and finally dropped it altogether, and we had only the \$150,000.

I believe the feeling of the committee was that it was best not to have an emergency appropriation in addition to the \$150,000, with the idea that, if a very unusual condition arose, it would be necessary for us to incur a deficiency and come to Congress for assistance if needed.

The experience this year has led me to repeat the request made in 1911 to have a larger emergency appropriation, and Secretary Houston has concurred in that recommendation and has incorporated that request in the miscellaneous section of the estimates.

FIGHTING AND PREVENTING FOREST FIRES.

The CHAIRMAN. Have you the number and page of the miscellaneous item?

Mr. GRAVES. That is on page 271, item 2.

The CHAIRMAN. For \$1,000,000?

Mr. GRAVES. The idea is to have one substantial fire emergency fund that would include the previously granted item of \$150,000. It has been demonstrated that an emergency fund of \$150,000 is inadequate. There are occasions when it is exceedingly embarrassing to have to incur a deficiency such as we incurred during this last spring. The fire season started very early. We had expected in the northwest districts to have to expend no more than \$8,000 or \$10,000 for fire fighting. The season broke in June and large expenses had to be incurred. It would have been very embarrassing out there were it not for the fact that some moneys were left in the national security and defense fund which had been allotted by the President to the Department of Agriculture.

The CHAIRMAN. The amount suggested is merely a guess as to the needs, is it not?

Mr. GRAVES. It is not altogether a guess. It is based on our experience during the last 10 years. We had our first big emergency in 1910, in which our deficiency appropriation was \$900,000; again in 1914, in which the deficiency appropriation was \$345,000; in 1916 the deficiency appropriation was \$57,000; in 1917 the deficiency appropriation was \$775,000; in 1918, \$650,000; and the past year is the first time that we have run over \$1,000,000.

The CHAIRMAN. About how large was the deficiency?

Mr. GRAVES. This year the deficiency was \$2,950,000.

Mr. McLAUGHLIN of Michigan. How much was placed at your disposal this year from the President's fund?

Mr. GRAVES. None in this fiscal year.

The CHAIRMAN. But in the year before?

Mr. GRAVES. In the last fiscal year, \$650,000.

Mr. McLAUGHLIN of Michigan. During the fiscal year ended June 30, 1919?

Mr. HARRISON. A million dollars was placed at our disposal. We expended \$650,000 and turned the remainder back into the Treasury.

Mr. McLAUGHLIN of Michigan. How much did you use out of that amount?

Mr. GRAVES. We used \$650,000—actually used that much—and returned the remainder to the Treasury.

Mr. MCKINLEY. That was in addition to the \$150,000?

Mr. GRAVES. That was in addition to the \$150,000.

Mr. MCKINLEY. I did not get it clear in my mind when it was that you used the \$2,950,000.

Mr. GRAVES. This last summer.

Mr. MCKINLEY. Since the 1st of June?

Mr. GRAVES. Yes, sir; and the deficiency appropriation was passed in the fall.

Mr. MCKINLEY. The \$2,950,000 was for the fiscal year ended June 30, 1920?

The CHAIRMAN. The current year?

Mr. TINCHER. That appropriation was handled by the Appropriations Committee?

Mr. GRAVES. Yes, sir.

As a general principle I do not think it is a good thing for the organization to feel that a deficiency may be incurred and recognized.

I want to make it just as hard as I can for my own organization to incur a deficiency; and I think it is better, unless there are some very extraordinary conditions, like this year's—which we hope will not happen again for another 30 years—to take care of the protection of the forests from funds which have been appropriated in advance.

Mr. McLAUGHLIN of Michigan. From the time this last emergency arose how long a time elapsed before the money was made available to you?

Mr. GRAVES. I think it was about two weeks and a half.

Mr. McLAUGHLIN of Michigan. So it does not take very long?

Mr. McKINLEY. That was because Congress was in session. If Congress had adjourned the 1st of July and had not met again until December, where would you have been?

Mr. GRAVES. There would have been a very great embarrassment, just as it has at different times been an embarrassment when the appropriation bill has been delayed until well after the beginning of the fire season. I recall that that happened in one of the years when we had the special emergency item of \$1,000,000, and the appropriation bill was not passed until August. We had a hard fire situation, and had to spend at a more rapid rate than one-twelfth of the appropriation within that time. The existence of this emergency appropriation was a great benefit.

Mr. McKINLEY. Suppose there is a great fire which you have to put out and you have no money, what do you do in a case of that kind?

Mr. GRAVES. We resort to various means. Sometimes local bankers help out and provide the immediate expenses of fire fighters, who have to be paid off at once. Sometimes the local men who are hired are willing to work and let the pay go over.

Mr. McKINLEY. Take their chances?

Mr. GRAVES. Take their chances; and it isn't a good situation.

Mr. McLAUGHLIN of Michigan. Can you tell us what appropriations were made last year by the States, and by private associations, and so on, for this purpose.

Mr. GRAVES. The landowners forming the Western Forestry and Conservation Association, which covers a considerable portion of the landholders in Oregon, Washington, northern Idaho, and northwestern Montana, expended in fire protection this last summer, I understand, approximately \$800,000. They own about 15,000,000 acres and probably undertake to patrol some additional private lands which are not within the association simply in order to safeguard their own forests. I have no data on the expenditures of private owners in fire protection elsewhere. I can give you some data on expenditures by the States for last year.

Mr. McLAUGHLIN of Michigan. Each one of those States makes an appropriation, does it, so that you know how much money will be available during the coming year?

Mr. GRAVES. I think that the appropriations will be approximately the same as their expenditures for last year. I do not have the appropriations here, but can give the expenditures in a number of the States. Shall I read those?

The CHAIRMAN. You may read them if you wish.

Mr. GRAVES. Oregon spent during the fiscal year 1919 approximately \$25,000; Washington, \$37,000; Idaho, \$46,000; Wisconsin,

\$16,000. I am giving these in round figures. Minnesota expended \$56,000; Michigan, \$60,000; New York, \$117,000; Maine, \$125,000; New Hampshire, \$26,000; Massachusetts, \$32,000; New Jersey, \$20,000; and then follows a number of States with lesser amounts.

Mr. McLAUGHLIN of Michigan. There are a number of States that have no forests?

Mr. GRAVES. Yes.

Mr. McLAUGHLIN of Michigan. When this money is expended here on our national forests is it in cooperation with your department or under your direction?

Mr. GRAVES. We have a cooperative arrangement in each State. They are practically the same, but necessarily a little different in individual cases, as we have different conditions and men to work with. We are undertaking to place in operation a protective system as between the Federal Government, the States, and the private owners.

Mr. McLAUGHLIN of Michigan. You say in each State; you don't expend any money in any States where there are no national forests?

Mr. GRAVES. In the national forest States. Of course, we do not have such cooperative arrangements in all national forest States. We have not yet succeeded in getting a satisfactory arrangement in California—not nearly as satisfactory as in Oregon and Washington. Our effort is to get a cooperative system so that all are working together. I can illustrate the way it works by an incident of three or four years ago. When the Oregon and California land grant was in litigation, and there were some bills in Congress in regard to it, the railroad company declined, because of an adverse decision in one of the lower courts, to protect this land which was under dispute. There were some 2,500,000 acres, and Congress authorized the Commissioner of the General Land Office to protect those lands, and provided an appropriation of \$25,000 for that purpose. They are in Oregon scattered in different parcels; some within but mostly outside the national forests.

The Commissioner of the General Land Office requested our cooperation because they had no fire protection organization. We handled the matter by telegraph, and inside of three days those lands were under official protection because we had this organized system in which the different public and private agencies were cooperating.

Mr. McLAUGHLIN of Michigan. It would seem better, then, to have this under the direction of the Forest Service rather than under the Land Office?

Mr. GRAVES. It worked out in the end just the same way. The lands were under the jurisdiction of the General Land Office, and so the matter had to be attended to in that way.

The CHAIRMAN. You said that the banks in the country sometimes carry these expenses; how do they do it, by discount?

Mr. GRAVES. They are merely private arrangements with our officers.

The CHAIRMAN. What do the banks have to show for the money they advance? Do you issue an order on the Treasury?

Mr. GRAVES. No; in those cases they would simply advance money and take chances through our own officers; these being really pri-

vate arrangements in which our own forest officers take the responsibility.

Mr. McLAUGHLIN of Michigan. You issue an order to the men doing the work, and they take it to the banks and cash it?

Mr. GRAVES. No; in those cases there may be, for instance, a dozen or fifteen men who have to be paid off, with no Federal money available for this purpose. The supervisor would take it up with the bank and would secure an advance of the money personally.

Mr. McLAUGHLIN of Michigan. That would not be legal on your part, would it?

Mr. GRAVES. No.

Mr. TINCHER. The chairman asked you if the banks discounted the money, and I understood you to say that it was a private arrangement between the bank and your officers.

Mr. GRAVES. This is simply an emergency, where we have no money. In some cases I have known the supervisors to go to a bank and borrow money at 6 per cent, and meet that expense out of their little salaries, in order to pay off some men.

Mr. TINCHER. I do not believe that answers the question yet. Where a bank advances this money, do they discount the vouchers of the men who fight fire?

Mr. MCKINLEY. They can't give a voucher; it is illegal.

Mr. TINCHER. Do they receive from the Government, when paid, any more money than their money back?

Mr. GRAVES. No, sir.

The CHAIRMAN. What is the next item?

Mr. GRAVES. The next item is on page 128, item No. 242, "For preventing and combating infestations of insects injurious to forest trees on and near the national forests, independently or in cooperation with other branches of the Federal Government, with States, counties, and municipalities, or with private owners." The amount is \$25,000.

This is a new item. I presented this same item to the committee of last year. Next to fire, the insect damage is the greatest we have in the national forests. We have to-day a serious infestation in the forests of California, in the Sierras, in the sugar-pine and yellow-pine forests. It is estimated that the yearly damage in California by this infestation is about \$235,000.

Mr. PURNELL. Is the State of California doing anything?

Mr. GRAVES. The State of California has not very many lands. Most of the lands are in the hands of private owners. There are some lands where the private owners are undertaking to combat the insects. Their lands are interlocked with our own, and the Federal Government is doing very little. Our own officers have been doing a small amount of work there each spring, but not enough to make any real progress against the infestation.

Mr. McLAUGHLIN of Michigan. Are all of the forest lands in California, outside of the national forests, held by private owners, or does the State own some forest lands?

Mr. GRAVES. The State has very little forest lands. They disposed of their grants years ago, and, while I think there are some few thousand acres in scattered tracts which are perhaps coming

back to the State for various reasons, the State has relatively little land. They have one or two parks, but very little other forest land.

Mr. McLAUGHLIN of Michigan. What is the State doing, if anything, in the way of protecting the lands they own?

Mr. GRAVES. I doubt very much whether these scattered lands are so located that they would be very much affected by this particular infestation. We also have an infestation which is giving some anxiety in Montana, near Missoula. We have still another attack in southern Colorado which is threatening a good deal of timber. In order to meet these situations this special appropriation is requested.

Mr. McLAUGHLIN of Nebraska. What species of insect is that?

Mr. GRAVES. That is a bark beetle. It is a different species of beetle from that which attacks in Montana, or the one in Oregon, or the one which attacks in the Black Hills, or the one which attacks the southern pine in the East, but in a general way its work is somewhat similar.

Mr. TINCHER. How long has that infestation been going on?

Mr. GRAVES. The insects are always in the forests. It is only when the infestations come that they do a great deal of damage. The conditions have been serious for six or eight years, but only during the last three or four years has it been spreading to large proportions.

Mr. TINCHER. You do not hope to exterminate the insects?

Mr. GRAVES. You never can exterminate them. All you can do is to restore the balance of nature between the insects and their natural enemies, which are always in the forests.

Mr. TINCHER. We have had in Kansas during the last two or three years an infestation that has done more damage than in 10 years, and that is the grasshopper, but the Government has not appropriated any money to fight the grasshopper.

Mr. GRAVES. It is possible to fight these infestations by artificial means. The work is being done in cooperation with the Bureau of Entomology. The work already done has demonstrated its effectiveness.

Mr. TINCHER. Don't you think, if we appropriate \$25,000 this year, that the committee next year will be asking for \$50,000, and the next year for \$100,000, and in 10 years from now you will be asking for \$250,000 for this item?

Mr. GRAVES. It depends on the insects, what the insects are doing. If we have more infestations, I doubt very much whether \$25,000 will fully check that infestation.

Mr. TINCHER. I think this appropriation would be like the appropriation to fight the Japanese beetle. We made appropriation to fight the Japanese beetle, on the theory that some had just been brought to this country. This is a different insect, an insect commonly in the forests?

Mr. GRAVES. This is a native insect.

Mr. TINCHER. This is a native insect in the forests. Some years it will be very prevalent, and other years not; is that the experience?

Mr. GRAVES. I am afraid this infestation is not going to die out of itself. Sometimes there are cycles of infestations by insects, but this is getting serious.

Mr. TINCHER. Have we had infestations during previous years?

Mr. GRAVES. Yes, sir.

Mr. TINCHER. And has Congress ever made any appropriations to control them?

Mr. GRAVES. There has never been any special appropriations but, as explained to the committee last year when we were discussing this subject, during several years when fire fighting did not absorb all of the \$150,000 emergency fund, a portion was used for fighting insect infestations. One year we had a severe infestation in eastern Oregon; I think some \$20,000 was expended then, and it was effective in checking the infestation.

Mr. RUBEY. Are you authorized to use that fund for that purpose?

Mr. GRAVES. It was a serious emergency, but I think it is desirable to have a fund specially set aside for insect work.

Mr. McLAUGHLIN of Michigan. Has the Bureau of Entomology an appropriation for the same work?

Mr. GRAVES. The Bureau of Entomology is investigating insects. This work would be done and the money would be expended in actual control of the work upon the public property. The Bureau of Entomology works with us; it places at our disposal the results of their investigations. This new appropriation would be used in the selection of the infested trees with broods in them, cutting them down, taking the bark off, burning up the broods, and all work of that sort.

Mr. McLAUGHLIN of Michigan. Does the Bureau of Entomology have any men there doing this work with you?

Mr. GRAVES. They have local field officers in different districts. They are presumed to give us the assistance within the national forests similar to that which is given by the Bureau of Soils.

Mr. McLAUGHLIN of Michigan. There is no duplication of work, then?

Mr. GRAVES. No, sir.

The CHAIRMAN. Is there anything further?

The next item is 243, on page 129, "for the purchase and maintenance of necessary field, office, and laboratory supplies, instruments, and equipment, \$173,600." There is an increase in that item of \$12,500. The note states that this amount is required to meet the enormous advance in the cost of many lines of supplies and equipment.

Mr. GRAVES. This increase is needed, of course, on account of the increase in the cost of those supplies.

The CHAIRMAN. Are you through, Col. Graves?

The clerk states that Mr. Ash desires to ask a hearing before the committee.

Mr. ASH. The organized lumber industry wants to be heard on the recommended increase for the Forest Products Laboratory. They believe there are good reasons why the increase recommended by the Secretary should be granted, and think that by making reference to past achievements of the laboratory they can convince the committee that the laboratory should be more adequately supported than it has been in the past. There is practically no scientific knowledge as to the properties of wood. The war program was greatly held up because of that lack of knowledge.

The CHAIRMAN. How much time is desired?

Mr. ASH. Two hours.

The CHAIRMAN. That is a long time. What is the desire of the committee?

Mr. LEE. Our limit has been an hour on nearly all these other cases.

Mr. ASH. We shall, of course, be glad to conform our statement to come within the time limit set by the committee. As stated, however, we would like two hours.

The CHAIRMAN. Will that be satisfactory, Mr. Ash, if we limit you to an hour?

Mr. ASH. Yes; that will be satisfactory; we will do the best we can in the time allowed.

Mr. CANDLER. I suggest that we give him an hour.

The CHAIRMAN. Without objection, the committee will hear Mr. Ash for one hour in connection with the Forest Service.

(Thereupon the committee recessed until the following morning.)

MORNING SESSION.

WEDNESDAY, *December 17, 1919.*

The committee met at 10 o'clock, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. We have with us this morning a number of gentlemen interested in the appropriation for the Forest Products Laboratory, which will be found on page 130, item 244, "for investigations of methods for wood distillation and for the preservative treatment of timber, for timber testing, and the testing of such woods as may require tests to ascertain if they are suitable for making paper," \$348,260.

I might state there have also been a number of communications received in regard to this item. We will hear Mr. Ash first.

STATEMENT OF MR. ROBERT ASH, WASHINGTON, D. C., ATTORNEY, OFFICE OF COUNSEL FOR THE NATIONAL LUMBER MANUFACTURERS' ASSOCIATION.

Mr. ASH. The National Lumber Manufacturers' Association, for whom I am appearing to urge an increased appropriation for the Forest Products Laboratory, is a federation of the lumber-producing associations of the United States, comprising in its membership the Michigan Hardwood Manufacturers' Association, Cadillac, Mich.; Northern Hemlock & Hardwood Manufacturers' Association, Oshkosh, Wis.; Northern Pine Association, Minneapolis, Minn.; West Coast Lumbermen's Association, Seattle, Wash.; Western Pine Manufacturers' Association, Portland, Oreg.; Western Forestry & Conservation Association, Portland, Oreg.; California Redwood Association, San Francisco, Calif.; California White & Sugar Pine Association, San Francisco, Calif.; Southern Pine Association, New Orleans, La.; Southern Cypress Manufacturers' Association, New Orleans, La.; Georgia-Florida Sawmill Association, Jacksonville, Fla.; and the North Carolina Pine Association, Norfolk, Va. In addition, I am appearing as representing the American Hardwood

Manufacturer's Association, Memphis, Tenn.; the Wholesale Sash & Door Association, Chicago, Ill.; the Oak Flooring Manufacturers' Association, Chicago; and the National Retail Lumber Dealers' Association, with main offices in Detroit, and with membership extending to every State in the Union.

For many years it has been commonly believed that the timber resources of the United States were inexhaustible. This, however, is not true, and year by year the supplies of standing timber are receding further and further from the principal consuming markets of the country. This decreasing supply of timber and its increasing distance from markets, together with other facts, has tended to increase the price of lumber and thereby increase the cost of goods manufactured from lumber. Some species are becoming very scarce, and substitute species must soon be found to replace them in the uses where they are now deemed almost indispensable.

The lumber and lumber-using industries well appreciate the seriousness of the present situation, and realize that steps must be taken to develop means of more fully utilizing forest products and of eliminating the waste that now characterizes nearly every step in the utilization of wood. This can be accomplished only through the determination of scientific information. There are at present losses in the forests due to the economic impossibility, under present conditions, of bringing material out at a profit. There are losses in sawing, due to a lack of knowledge of the right and the wrong way of sawing logs of various species and sizes. There are losses in drying which could be prevented if proper knowledge of methods were available. Such losses may reach as high as forty or fifty million dollars a year—all species considered. Until the Forest Products Laboratory began its investigations of the drying of wood practically all lumber was dried by rule of thumb methods. This resulted in great loss, especially in kiln drying, due to checking, warping, etc. The Forest Products Laboratory has already made great strides in teaching the lumber and wood using industries to eliminate waste by the proper drying of their material.

Wood preservation is not understood and is not used to anywhere near the extent that it should be. Only scientific knowledge can develop wood-preserving methods which are commercially practical. Along with wood preservation there is a great field for the development of fire retardance and fire-resistant construction.

Wood pulp made from spruce logs is now the basis of most newsprint paper and the supply of spruce pulp logs is decreasing, although the demand for newsprint is increasing. As a result we are now facing a paper shortage that is causing a suspension of dozens of newspapers. Only day before yesterday Congressman Anthony stated before the Post Office Committee that between 2,500 and 3,000 small newspapers faced extinction unless the newsprint situation is soon relieved. It is undoubtedly commercially practical to manufacture newsprint from other than spruce logs. Developing new sources of material for newsprint paper is one of the many phases of the experimental work of the laboratory that should be adequately provided for.

The above are common examples of the losses which occur in the manufacture and use of wood. Examples practically without limit

might be given. For instance, in vehicle making, and this concerns vehicle manufacture for farms possibly as much as all other purposes put together, high-grade hardwood is used almost exclusively. Losses in drying this wood may average 20 per cent and run as high as 50 per cent. Some of the material must be bent, as in the manufacture of wheel rims, and here again a further loss of as much as 50 per cent is not uncommon. Such loss must of necessity be passed on to the consumer. By the use of the proper methods these losses can be eliminated, with a resultant direct benefit to the consumer and to the general public in that a great natural resource will be conserved.

Practically nothing is known of the scientific qualities of wood as compared with that of other building materials. As a result much wood construction is based upon a favorable experience in the past rather than upon the true qualities of the materials being used. Large and expensive wood is therefore often used where smaller and less expensive species might be utilized with as good results. Such conditions are due to the lack of knowledge as to the properties of wood for a particular purpose, and because some species of wood are more aggressively advertised and sold than others.

The development of scientific knowledge with reference to wood can only be done by the Federal Government, because any conclusions reached by a private agency would not be given full faith and credence by the public, and because the lumber industry is divided into many regional units—each region producing a few particular species of wood. The species of the various regions are in fierce competition, and if an organization within the industry were to attempt to develop scientific knowledge as it affects lumber it would naturally limit its experiments to the particular species grown in the region, and the conclusions arrived at might be prejudiced as against the species of a competing region. At least there would be inference that such might be the case.

The general public will be best served if some impartial agency develops the facts with reference to competing species. When a man desires to build a barn or other building he should know the wood best adapted to his needs.

As spokesman for the lumber manufacturers, I appeal to you for assistance that must come only through intensive study such as that now under way at the Forest Products Laboratory. I know of no other thing that will accomplish so much in the wise use of our timber resources and which will result in so direct a saving to consumers of wood products.

The work already done has been a revelation and points to the need of work on a vastly increased scale. I therefore wish to urge upon the committee, on behalf of the lumber manufacturers, the most liberal support for the laboratory in the way of appropriations. An expenditure of \$500,000 a year will be returned to the public and to the industries concerned many times over.

Following me there will be brief statements by men who have direct contact with the laboratory and who will be able to give specific reasons why the work of the laboratory should be continued on a large scale.

In conclusion, I desire to have inserted in the record the names of some 230 trade organizations in the wood and wood-using industries

who approve the work of the laboratory and who believe it should be given an appropriation of at least \$500,000.

And as a parting word, I want to say that the laboratory has the utmost confidence of the wood and wood-using industries; the confidence that it has is rather unusual for a Government organization. The whole personnel understands the lumber industry and meets its problems with an understanding which is unusual. This applies to the director of the laboratory, Mr. C. P. Winslow; the assistant director, Mr. O. M. Butler, and the members of the staff. They are particularly high caliber men.

Mr. Chairman, I suggest that you call the other men in the order I have given them on the list I have handed you.

The CHAIRMAN. The country is particularly interested in knowing the reason for the high price of lumber, whether it is due to the lack of appropriations, or to other causes?

Mr. ASH. There are several reasons for the high cost.

The CHAIRMAN. It seems that the more money we appropriate, the higher the prices go, and that unless the supply of the forests increase the price may become prohibitive.

Mr. ASH. Of course, all commodities are advancing in price. The only comparative statistics available are those prepared by the Bureau of Labor Statistics, Department of Labor.

The CHAIRMAN. We all know that the price of lumber is five times as high now as it was a few years ago.

Mr. ASH. Lumber has increased in price less than any commodity, as the prices are reported by the Bureau of Labor Statistics.

The CHAIRMAN. A few years ago lumber was selling in my section of the country for \$11 and \$12 a thousand. Now I pay \$100.

Mr. JONES. And where it used to cost \$3 and \$4 a thousand it now costs \$30 a thousand to put it on the car.

The CHAIRMAN. Does that include the stumpage?

Mr. JONES. No; the labor cost.

The CHAIRMAN. \$30?

Mr. JONES. It is different in different localities.

The CHAIRMAN. They saw it for \$10 in my section of the country.

Mr. JONES. Now?

The CHAIRMAN. Yes. You can take it from the stump and put it through the mill for \$10.

Mr. LEE. Yes; in my section of the country you can have it sawed for \$10 a thousand.

Mr. JONES. And put through the mill?

Mr. LEE. Yes, sir.

Mr. JONES. Yellow pine?

Mr. LEE. Any kind; hardwood, or any kind.

The CHAIRMAN. How much is stumpage? Let us get at this and find out what there is in it.

Mr. MCKINLEY. To start with, what is the price of lumber in Iowa?

The CHAIRMAN. Practically all kinds of lumber is over \$80 a thousand. I paid \$80 a thousand for common boards a short time ago.

Mr. MCKINLEY. \$80 a thousand for fencing?

The CHAIRMAN. For common boards.

Mr. ASH. I can not give you the price in Iowa, but I have not heard of common boards selling for \$80 a thousand in any section. Straight-grain flooring might bring that amount, but not common boards.

Mr. LESHNER. You will pay pretty near that for fencing lumber.

The CHAIRMAN. Can you give an estimate of the cost?

Mr. ASH. The costs vary greatly in the different regions. At present lumber-manufacturing costs are high and are constantly mounting higher, because of the constantly decreasing output. This is due to several reasons. In the South now, and for several months past, the weather conditions have not been favorable. The country is practically under water, and in the lumber country for miles and miles it is impossible to get out the logs. The mills are running at only partial capacity, and their overhead is practically eating them up. Many mills are actually discontinuing cutting.

During the war, of course, lumber prices were fixed so low that only the most efficient mills could afford to operate, and at the end of the war not over 50 per cent of the capacity of the industry was operating. As a result, much of the labor drifted away from the mills and most of it has not come back. The mills that are in a position to get out their logs are handicapped by a labor shortage. In some sections of the country especially in the South, there are labor difficulties. Recently the inability to secure coal for logging locomotives has been another factor tending to decrease production. The lumber industry produces more fuel than it consumes, but it must have coal for logging-locomotives. As I stated the weather conditions in the South are retarding operations.

On the West coast, which until recently has been the only region in the country that has been producing anywhere near normal, the weather conditions are now very severe. They are having colder weather there than they ever had and the mills are shut down because of the weather conditions.

Another factor that is holding up production (and of course the lack of supply means higher prices), is the car shortage. Mills that have lumber to ship can not get the cars. Any number of mills especially along the Atlantic seaboard have been shutting down because they can not get anywhere near their car requirements.

The CHAIRMAN. That accounts for the shortage in the supply, but why the high prices? Are they taking advantage of that?

Mr. LEE. That condition in the South has only prevailed in the last few weeks—the rain and cold weather.

Mr. ASH. All this year the weather conditions have been unfavorable.

Mr. LEE. The high water has only come within the last two or three weeks down there, and the cold weather has only been experienced in the last few weeks. Those conditions are only temporary.

Mr. ASH. We hope they will be remedied soon, of course. The labor shortage has been acute since the war and is not straightening out very rapidly.

The CHAIRMAN. Why the high price?

Mr. ASH. There are several reasons.

The CHAIRMAN. Is advantage taken of the shortage of lumber?

Mr. ASH. Of course the law of supply and demand works to a certain extent. But the mills have not been able to operate at capacity for the reasons I have stated and when running at partial capacity the costs are much greater than when they are running at full capacity. In addition, all operating costs have advanced greatly. Labor costs since 1914, have advanced over 100 per cent in all regions, and material costs even more than 100 per cent.

The CHAIRMAN. How much are the profits?

Mr. ASH. According to the statistics just issued by the Bureau of Internal Revenue, the average profits in the lumber manufacturing industry as shown by the tax returns, are less than 10 per cent.

The CHAIRMAN. What does it cost to manufacture a thousand feet of common lumber?

Mr. ASH. The costs vary in various regions and with the different mills. Such recent cost figures as I have seen for the Southern operators (this is run-of-mill stock) have varied from in the neighborhood of \$18 up to nearly \$46 a thousand, with the average cost about \$27. These figures are for September, costs are higher now.

The CHAIRMAN. Common lumber.

Mr. JONES. That is the cost of getting it out?

Mr. ASH. Yes; the cost of getting it out, putting the lumber through the mill, the complete lumber manufacturing cost, although these costs do not include interest on loans on invested capital.

The CHAIRMAN. You mean for the mill-run?

Mr. ASH. Yes; for the mill-run.

The CHAIRMAN. From \$18 to \$46 a thousand?

Mr. ASH. Yes.

Mr. JONES. And that does not include stumpage?

Mr. ASH. It does include the stumpage.

Mr. JONES. What is the price for stumpage?

Mr. ASH. The price for stumpage would average about \$5.50.

The CHAIRMAN. Why do they pay \$18 to \$46, when it can be done for \$10?

Mr. ASH. It can not be done for \$10.

The CHAIRMAN. Mr. Lee states it can be.

Mr. LEE. I gave a contract for 100,000 feet and delivered the logs, and they cut it in the mill for \$10 a thousand.

Mr. JONES. Where you have a circular mill you can go in and cut a little on the side and do that, but you can not regulate the price of lumber on the basis of the cost to the portable-mill lumberman.

Mr. LESHER. Can not the large man manufacture cheaper than the small ones?

Mr. JONES. Absolutely no.

Mr. LESHER. Then, it would seem it would be better to have portable mills.

Mr. ASH. The portable mills, Congressman, can only manufacture a very, very limited number of items.

Mr. LESHER. I know; but I question whether portable mills can cut cheaper than the large mills.

Mr. ASH. They certainly can.

Mr. JONES. It is a fact, and every lumberman in the country will tell you that. Is not that right?

Mr. ASH. There is no question about it. All the costs show it.

Mr. LESHNER. You are off on that.

The CHAIRMAN. Years ago I was having lumber sawed by a portable mill for \$6 a thousand. I was told that if I had a large quantity and if I would sign up a contract for a considerable amount, they would saw it for \$3.50. The people are more interested in the price of lumber than anything else. Lumber and sugar seem to be the topics of discussion nowadays.

Mr. RUBEY. I do not know whether this gentleman is an expert on shingles or not, but I would like to have somebody tell us the reason for the high cost of shingles; why they have increased in price 300 per cent or more.

Mr. ASH. I do not feel qualified to tell you about the conditions with reference to the price of shingles, but I think the same general statement of the conditions in the industry would be true in regard to shingles.

Mr. RUBEY. That does not satisfy me.

Mr. CANDLER. Is there any prospect in sight for lumber getting any cheaper?

Mr. ASH. Probably the prices may recede a little; but, with the present costs, it is absolutely impossible to sell lumber at much less than it is being sold now. In fact, lots of mills are shut down because they can not manufacture at a profit.

Mr. RUBEY. Would not this be a good time for the Government to go into the business and get rid of the lumber it has in these great forests that we have been keeping up for so many years?

Mr. MCKINLEY. We can not cut all the lumber in the country and not put in new trees and expect to get lumber cheaper.

Mr. RUBEY. We have enough now to last for a long time.

Mr. CANDLER. Is the demand for lumber throughout the country increasing because of increased building demands?

Mr. ASH. Yes; the demand has been above what it was before the war, although the latest statistics show a falling off in demand. This is due to several reasons. You will remember that during the war the War Industries Board would not allow any private building, and for the period of the war there was no private building. Throughout the country there is a great shortage of housing facilities, and that all means that at present there is a heavy demand for lumber.

The CHAIRMAN. How does the price of stumpage compare with the price heretofore?

Mr. ASH. That varies greatly throughout the country.

The CHAIRMAN. Can we not have something definite on this proposition?

Mr. ASH. It will run now probably from \$5 to \$7 for southern pine, less for some other species, and more for still other species.

The price of pine stumpage within the last few years has increased, I should say, from \$1 to \$2 a thousand.

The CHAIRMAN. From \$1 to \$2?

Mr. ASH. Yes.

The CHAIRMAN. And the cost of production how much?

Mr. ASH. The cost of production has increased considerably over 100 per cent. Labor has increased more than 100 per cent.

The CHAIRMAN. Then the price of stumpage and labor has increased about 100 per cent?

Mr. ASH. Yes.

Mr. ANDERSON. In how long?

Mr. ASH. I am figuring 1913 as a basis.

The CHAIRMAN. The cost of production is about double?

Mr. ASH. Yes; and the selling prices of lumber have not doubled, according to the Bureau of Labor Statistics.

The CHAIRMAN. I will have to take exception to that. Nearly everybody knows what lumber is selling for.

Mr. CANDLER. With reference to trees growing that the chairman spoke about a moment ago, here is a letter from the American Forestry Association which I have received this morning, in which they state that much of the timber supply in the East has gone, and so has that around the Lake States; that in the South it is going rapidly and will not last much longer than 10 or 15 years, and that it is being cut from two to three times faster than it is growing.

The CHAIRMAN. Thank you, Mr. Ash. We will hear Mr. Hogue next.

**STATEMENT OF MR. C. J. HOGUE, OF NEW YORK CITY, ENGINEER
IN FOREST PRODUCTS, WEST COAST LUMBERMEN'S ASSOCIATION,
SEATTLE, WASH.**

Mr. HOGUE. Mr. Chairman and gentlemen, I am very glad to appear for the Forest Products Laboratory. I think the manager of our association has communicated direct with the chairman by wire in support of the appropriation.

Lumber, although it is probably the oldest building material, the longest-used building material, is really in its infancy from the standpoint of industrial development and I am very glad to speak, just briefly, on the operation and work of the Forest Products Laboratory from a technical standpoint, from the standpoint of its value in the use of lumber as a structural material, as a material of engineering, because lumber is an engineering material. It has been very backward from the standpoint of technical development. Steel and cement, competitive materials, are process materials that are assembled from various raw materials, in which the percentage of the different ingredients is proportioned to answer all kinds of construction. Lumber, as a natural resource, has to be taken from the forest as found, cut as best it can be cut, and then sorted and graded as best adapted to its use. Architects and engineers who have been writing detailed specifications for steel and cement have largely taken lumber for granted. I appreciate the compliment that they have taken lumber on faith, but it is not the economic and efficient way to use lumber.

Lumber stands, I think, second or third among the industries of the country, but is made up of small units. The production last year was something like 30,000,000,000 feet, and I imagine the largest single production was possibly 300,000,000 feet. A million feet a day is, so far as we know, the largest daily output of any plant, and from that it goes down to very small amounts. So that while lumber in itself is a big industry, its production is divided among a tremendously large number of very small units. For that reason, lumber has not been able to develop itself technically as the big

steel and cement industries do in which the production is in very large units, and that is one reason why the Forest Products Laboratory is particularly advantageous to us. The lumber industry might, in groups, support the work of the Forest Products Laboratory itself, and it does to a certain extent in special detailed investigations. But on the other hand it is very important there shall be some independent authority that will develop these facts. Just the other day I was speaking to the building commissioner of Philadelphia about a new grade that was being put on the market. He was entirely receptive to it and the values were satisfactory, but he said "Send me those facts and give me the data developed by some authority outside of your own association so I will know it is disinterested and dependable." And it is necessary to have some authority to develop the facts we need to know.

Just to speak of it from one other point of view, lumber is a very large supporter of commerce through the enormous freight it gives to the railroads, and it is a very large taxpayer. We get plenty of attention from some departments, and more particularly restrictive and investigative, from the Department of Justice, the Department of Labor, the Treasury Department, the Interstate Commerce Commission, the Internal-Revenue Department, and the Federal Trade Commission. But the Agricultural Department is the only department that is doing constructive work for us, and for that reason we believe it should be liberally supported. They are conducting research in a great many lines of very great economic importance. They have made wonderful studies in the construction of aeroplanes and propellers. The stresses to which an aeroplane wing is subject are most complex, and they have developed there a system of levers by which they apply the loads, both loads to the supports and to the wing, such as it gets in the use of the aeroplane. A propeller for an aeroplane is almost as delicate an apparatus as the balance wheel of the watch: It must be refined to the last degree.

And they have made wonderful studies in the development of waterproof glues, glues waterproof in themselves and which are stronger than the wood which they join together. That results in development of ply wood and the use of small pieces of lumber. We are always accused of the waste in lumber, and that is one of the means of eliminating it—the development of the use of smaller pieces of lumber by developing some means of putting them together.

Just a few of the items developed along that line are the development of the application to bowling pins of putting laminated wood together, and the last I heard of laminated wood bowling pins, which were tried out up in Madison, they lasted longer than solid bowling pins. And so now we are applying laminated wood to spindles for cotton spinning, which demands a tremendous amount of wood. Some of the things which in the aggregate take a great deal of lumber are shoe lasts, which take enormous quantities of hardwood, maple and things of that sort, and by putting together small pieces of wood they can accomplish the same purpose.

They are making great studies in kiln drying, and just now of special importance is the work the laboratory is doing on the west coast to help study the application of kiln drying to common boards and plank.

Next is the more efficient use of wood by the paper manufacturers; and they are doing everything they can to develop an economical method of manufacturing paper of pulp wood and paper.

They have made very remarkable studies in the manufacture of boxes. They have a very interesting means of testing boxes. They have found by a very slight increase in the cost of manufacture, simply by proportioning the size and length of the nails to the hardness or softness of the wood, that there can result great economies in the use of boxes and losses that result from using improper containers.

Those are only a few of the things they are working on, and almost any one, or any few of those put together, will far more than pay for the whole cost of the laboratory in the economic saving of wood which they will make.

Much of their work, which was started as a war-time research work; has necessarily been discontinued because of the discontinuance of war-time appropriations—appropriations which were available from other departments. So now they have to rely only on their regular appropriation and a great deal of this very important work will have to be discontinued unless there can be means provided for continuing it. They are making more studies into the manufacture of by-products from waste, rather than from wood, than any one else. Probably, outside of the laboratory, there is very little study being made in the development of by-products. I was in Madison recently, and they showed me a breakfast food for cows which was made from wood waste. They had taken out the dungs, resins, and acid, and they left what made a mighty good roughage. [Laughter.] You know wood is nothing, after all, but carbohydrate, which has the same usefulness as sugar and starch, and by taking out the deleterious ingredients and leaving practically sugar, and by adding something to give it a little taste they give the cows the sugar which they need and get a very good roughage out of the by-products.

There is a growing spirit of efficiency in the use of lumber and the Forest Products Laboratory is a big factor in its development, and it will also be a big factor in the development of economies. I do not know whether I want to promise that their efforts will result in a reduction of the price of lumber, but it will go a long ways toward keeping it from going any higher than necessary.

A gentleman has spoken about the cost of lumber being \$10 a thousand for manufacture—

Mr. LEE. I meant at one place.

Mr. HOGUE. I was going to say you are very close to it. The cost of manufacture in our district, according to our latest information, is \$12 a thousand on the average. You said you had furnished the lumber, so you will see that does not include the cost of getting out the timber.

Mr. JONES. You mean just putting it through the mill?

Mr. HOGUE. Just putting it through the mill; that is the point.

Mr. JONES. I agree with him on that. You are speaking of the west coast?

Mr. HOGUE. Yes; of the west coast.

Mr. JONES. I want to ask you whether \$10 is not pretty nearly the price for jobbing in the woods?

Mr. HOGUE. About \$12 is the average price. It varies materially—from \$8 to \$16.

Mr. JONES. What does it cost to job out there per thousand?

Mr. LEE. What do you mean by "job"?

Mr. JONES. Cutting the trees, felling the trees, hauling the trees, and delivering them to the tram.

Mr. HOGUE. An equal amount.

Mr. JONES. About how much?

Mr. HOGUE. About \$12 a thousand.

Mr. JONES. That is for the jobbing?

Mr. HOGUE. That is the point I want to make.

Mr. JONES. About what does it cost per thousand to get it to the mill on the tram roads?

Mr. HOGUE. That varies. Some mills are so located they have no transportation costs, while at others it runs from \$5 to \$6 a thousand.

Mr. JONES. What does it cost to get it through the mill?

Mr. HOGUE. \$12 a thousand.

Mr. JONES. That brings it up to \$25 or \$26 a thousand?

Mr. HOGUE. \$25 to \$26 is the average cost.

The CHAIRMAN. Which includes stumpage?

Mr. HOGUE. Which includes stumpage, because their stumpage costs are low. Our stumpage cost is around \$2 a thousand.

Mr. JONES. And the eastern cost is from \$5 to \$10?

Mr. HOGUE. In the southern section it is from \$5 to \$10.

Mr. JONES. In the eastern section?

Mr. HOGUE. In the eastern section, from \$5 to \$10. The point I want to make is that Mr. Lee spoke of \$10 as the cost of sawing and he furnished the material, which is correct for his locality and very nearly correct for ours. I want to make the point the cost of stumpage and furnishing the lumber adds an equal amount to putting it through the mill. So if you say \$10 for that, then it would be \$20 in that particular locality as the average cost of stumpage and getting out the lumber.

The CHAIRMAN. What is the cost f. o. b.?

Mr. HOGUE. If the chairman bought No. 1 vertical flooring for his fencing—

The CHAIRMAN. They were just common boards used for the floor of the corncrib.

Mr. HOGUE. Common boards on the west coast are selling for between \$25 and \$30 a thousand and to the Middle West there is a freight charge of probably \$15 a thousand. So this material delivered to the dealer in the Middle West should not exceed in cost \$40 to \$45 a thousand.

The CHAIRMAN. For what lumber?

Mr. HOGUE. Douglas fir, western hemlock, and spruce. Then the retailer adds his costs for handling, overhead, and so forth, probably 15 to 20 per cent, so that the cost of common boards should not run over \$50. The most expensive lumber with our line is No. 1 vertical grain flooring which has not been sold, except in possibly a very few isolated instances, at more than \$70 a thousand at the mill. But that is so light you would not have a freight cost of more than \$10 a thousand. So that taking \$70 at the mill and \$10 for freight, it could be delivered to the retailer for around \$80 and should retail for not more than \$100 a thousand anywhere in the West.

The CHAIRMAN. You can not put bird's-eye maple on a floor in the West for that. Maple up in our country is selling for \$130 a thousand. Some years ago I bought it for \$32.

Mr. HOGUE. Maple is getting pretty scarce. But it hits me pretty close up home, when you talk about the increase in the cost of lumber, because we pride ourselves on the fact lumber has increased in price less than any other material, only about two-thirds, while everything else has increased in cost 100 per cent. And there is this point that must be remembered: Between 1910 and 1914 lumber was selling at more than as much below cost then as it is now selling above cost. So that we had to go not from a fair profit but from a decided loss up to the price we are getting now. And where last year the last fixed price by the Government for lumber was \$26 a thousand, our average return for our lumber up to August this year for the whole year was only \$26.50 a thousand at the mill, or only 50 cents a thousand more than the last Government fixed price, and with an increased cost of \$7 a thousand.

The CHAIRMAN. That is f. o. b. mill?

Mr. HOGUE. F. o. b. mill.

The CHAIRMAN. What was it six years ago?

Mr. HOGUE. It has been as low, a number of years ago, as \$6 a thousand at the mill, but the manufacturer was losing money—two or three or four dollars a thousand, at that price.

The CHAIRMAN. How much has the price of stumpage increased?

Mr. HOGUE. Very slightly with us, because there has been no market for stumpage within the last four or five years. In fact, I think stumpage, during the speculative period of 8 or 10 years ago, was higher than it is now.

The CHAIRMAN. Then it is fair to say that in the last five years the price of lumber has just about doubled?

Mr. HOGUE. I think it is fair to say that.

The CHAIRMAN. That is perfectly satisfactory. I wanted to find out what the facts were.

Mr. HOGUE. Before the war labor was \$2 a day, and now we are paying \$4.80, and labor is from 50 to 55 per cent of the whole cost. And the materials have increased 100 per cent.

The CHAIRMAN. How much has transportation increased?

Mr. HOGUE. Transportation is the same, I should say, or not so much.

The CHAIRMAN. What is the rate to Minneapolis?

Mr. HOGUE. I do not know the rate to Minneapolis, but the rate to Chicago is 55 cents, and to Minneapolis it is 45 cents, I presume.

The CHAIRMAN. Take it by comparison?

Mr. HOGUE. The average shipping weight varies from 2,000 pounds a thousand to 3,000, depending on whether it is kiln-dried flooring or heavy timbers. And on the basis of 3,000 pounds, with a 50-cent rate, that would be \$15 a thousand. On a basis of 2,000 pounds, with a 50-cent rate, it would be \$10. So in the Middle West it would be from \$10 to \$15 you would have to pay for freight.

The CHAIRMAN. Then the lumber costs, laid down, just about \$40.

Mr. HOGUE. Our mill-run at the mill is \$30 a thousand, practically. Adding \$12 to \$15 a thousand for freight, that would make between \$40 and \$50.

The CHAIRMAN. How would that apply to white pine?

Mr. HOGUE. I am not familiar with Minnesota pine. But the point is that the I. W. W. arguer uses No. 1 vertical grain flooring and tells the workingman that the manufacturer is making his stuff for \$12 a thousand and selling it for \$120, but he does not say that No. 1 vertical grain represents one-fourth of 1 per cent of the whole output, and that where it may be selling at retail for \$120 a thousand in the East, the average return is only \$30 a thousand. And our mills, for the average, from the 1st of January to the present time, show only an amount above the cost of production of something like \$1.50—between \$1 and \$1.50, which amounts to about 3 per cent on the invested capital, and the return was \$4 this year.

Mr. JONES. Is your lumber graded?

Mr. HOGUE. Yes, sir.

Mr. JONES. When a log is put on the carriage there is a certain portion of that log that is sold at less than the cost to manufacture?

Mr. HOGUE. Decidedly so.

Mr. JONES. What per cent of that log is sold at less than the cost of manufacture—of your character of lumber?

Mr. HOGUE. I should say more than half of it.

Mr. JONES. About 60 per cent of it?

Mr. HOGUE. About 60 per cent of it, because only about 20 per cent is clear and 80 per cent goes into the lower grades.

Mr. JONES. About 60 per cent of every log put through the mill you have to sell at less than cost?

Mr. HOGUE. At less than cost.

Mr. JONES. And that has been true ever since the lumber business was created?

Mr. HOGUE. Absolutely; because the spread in price is far greater than the spread in cost—I mean the variation from high to low.

Mr. JONES. That is also true of the hardwoods of the East?

Mr. HOGUE. It is true of all woods that I know of.

Mr. JONES. Probably not hemlock, because—

Mr. HOGUE. Possibly not, because that is of a more uniform grade.

Mr. CANDLER. The other part of the log is used for some purpose; even the sawdust?

Mr. HOGUE. That is true.

Mr. CANDLER. So that there is nothing lost to-day?

Mr. JONES. But it is sold at less than the cost to put it through the mill.

Mr. HOGUE. A large percentage is sold as logs and slabs.

Mr. CANDLER. But what you get out of that contributes to reduce the increased price of the other, because there was a time when that part of the log was absolutely lost, whereas it is all utilized at the present time.

Mr. JONES. I do not think it was ever a total loss to the sawmills, because they used it as fuel instead of coal.

Mr. CANDLER. I have seen lots of it that was just burned up.

Mr. JONES. Yes.

Mr. HOGUE. The big loss and waste is in the woods. The reason it is called waste (as a matter of fact the waste is small) is because it will not pay to manufacture it into a by-product. But now, as the materials get scarcer, and as we get into the condition

of Europe, we will develop our by-products and use the waste, but it is not economically possible to do it now.

Mr. McLAUGHLIN of Michigan. You spoke of other departments of the Government that were contributing to the cost of the laboratory in Madison. What other departments and how much money is being contributed?

Mr. HOGUE. I do not know. I know during the war there were appropriations available from the War Department, the Navy Department, and possibly some other department for special investigations. For instance, a good deal of this research in aeroplane propellers and aeroplane construction was paid for out of appropriations from those departments; and those appropriations are no longer available.

Mr. CANDLER. What is the appropriation now available for the laboratory?

Mr. HOGUE. \$175,000, I think.

The CHAIRMAN. \$173,260.

Mr. CANDLER. How much increase is being asked for over and above the present appropriation?

Mr. HOGUE. I think the regular appropriation, plus these extraordinary appropriations, was considerably smaller than the appropriation that is asked for next year.

Mr. CANDLER. You want an increase now from \$175,000 to \$500,000?

Mr. HOGUE. \$350,000 I think is the amount asked for.

Mr. LEE. Increase or—

Mr. HOGUE. \$350,000 is the total amount asked for now.

Mr. RUBEY. \$348,260 is the amount of the estimate.

Mr. CANDLER. Do you know anything about the conditions existing in the South at the present time in the lumber business?

Mr. HOGUE. Not particularly, except the information that is brought to me. I know they have suffered this year tremendously, all through the year, from labor troubles and weather conditions, and the production has been very much curtailed and the cost has been very high. Their costs are higher than our costs.

Mr. CANDLER. The demand for lumber is growing all the time, due to the increase in building operations?

Mr. HOGUE. There is a tremendous demand which this year has not been satisfied.

Mr. CANDLER. The lumber mills have not been able to meet the demand?

Mr. HOGUE. No; our mills have been running for the last month at capacity, and yet they have not begun to supply the demand.

Mr. CANDLER. What is the extent of your lumber operations?

Mr. HOGUE. About 20 per cent of the annual production of the United States at the present time.

Mr. CANDLER. How much do you produce a season?

Mr. HOGUE. Our production last year was $7\frac{1}{2}$ billion. That is 25 per cent; $7\frac{1}{2}$ billion out of 30 billion.

Mr. CANDLER. Where are you located?

Mr. HOGUE. On the west coast of Oregon; just this strip along the Cascade Range between Oregon and Washington [indicating on map]. We have about 25 per cent of the standing timber of the United

States and we are getting to be the chief source of supply as other sections of the country are cut out. Until they can be reforested and again brought into production, we will have of necessity to be the reliance of the United States.

Mr. CANDLER. In a letter which I received this morning it is stated that the lumber is being cut two or three times faster than the trees are growing. You seem to have a very large interest, and I would like to know whether that is true or not?

Mr. HOGUE. It is.

The CHAIRMAN. Thank you, Mr. Hogue. We will now hear Mr. Nellis.

STATEMENT OF MR. J. C. NELLIS, ASSISTANT SECRETARY, NATIONAL ASSOCIATION OF BOX MANUFACTURERS.

Mr. JONES. Where are your headquarters, in Baltimore?

Mr. NELLIS. The headquarters of the association are at Chicago. I am stationed at Baltimore. The National Association of Box Manufacturers has affiliated with it all but one of the several regional associations of box manufacturers, so that I can assume to speak for practically the entire wood-box industry.

The National Association of Box Manufacturers, the national organization of wooden box manufacturers, supports without qualification the proposal of the National Lumber Manufacturers Association and other forest products associations, that the Forest Products Laboratory needs at least \$500,000 a year to operate to the full measure of the needs of the forest products industries for scientific industrial research.

The National Association of Box Manufacturers has cooperated with the laboratory for several years in box testing and will continue to cooperate.

The laboratory has established the value for boxes of about 50 kinds of wood, including many minor species previously unknown to box users but now available to box manufacturers who in some sections, for example, Wisconsin and Michigan, buy such woods from farmers who are clearing land.

I might say parenthetically that the same kind of stuff goes to the pulp manufacturers, too.

The laboratory has, with limited data, set up strength standards for four groups of the 50 box woods. Further grouping is needed.

Laboratory tests have shown slender cement coated nails to have greater holding power than thick smooth or barbed nails.

The standard canned goods box specifications formulated after extensive tests by the Forest Products Laboratory have been adopted by the following:

National Association of Box Manufacturers, National Canners' Association, National Wholesale Grocers' Association, United States Food Administration, Quartermaster Corps, War Department, Navy Department, American Society for Testing Material.

Mr. Chairman, I have copies of those specifications here in case anybody cares to see them.

The reports of the Forest Products Laboratory were the basis for, and the contents largely of, the general boxing specifications of the

War Department, and the separate specifications of the Ordnance Corps, both issued in 1918.

I have copies of those also if anybody cares to see them. This was last year.

The laboratory makes box tests for the Bureau for the Safe Transportation of Explosives and Dangerous Articles which is maintained by the railroads.

In cooperating with the Railroad Administration's Committee on Packing, Containers, and Prevention of Loss and Damage the laboratory reports enabled us to convince that committee that, in general, boxes could be strengthened by using more nails and strapping, rather than by using more lumber. This, also, is a conservation of wood.

Laboratory tests have shown that with proper nailing and strapping, boxes made from the lowest grades of lumber may be made serviceable.

The National Association of Box Manufacturers has recently adopted and is now giving considerable publicity to a revised schedule for nailing boxes prepared by the Forest Products Laboratory. I have copies of that also if anybody cares to see it.

I am attaching to this memorandum a copy of the monthly bulletin issued by our association, called The Wood Box. It is the December issue. There are on five pages of it articles either quoted from the laboratory or about the laboratory. There is one communication from a company which had its crate tested, and it cheapened the cost of the crate and gained about 600 per cent in strength. The fact that these articles are quoted in the box association bulletin shows how much we depend on the laboratory.

The Forest Products Laboratory has the only special box testing apparatus operated exclusively for the public interest. Similar special machines are operated by several corporations but the public's box-testing laboratory is the most inadequately financed of all.

The wooden-box industry uses about 15 per cent of the lumber produced in the United States. It is low-grade lumber, No. 2 to No. 4, common in the various woods. These low grades would to a large extent be unusable otherwise. The proportion of low grades in our lumber cut is increasing each year as virgin timber becomes less and second growth is cut more and more. The utilization of the increasing proportion of low-grade lumber calls for increased scientific investigation to indicate new methods, the construction of boxes with even lower-grade lumber than now, stronger boxes with the use of no more lumber, with the use of stronger woods, etc.

Referring to stronger woods, I would like to call your attention particularly to the fact that there are several woods existing in large quantities that are used very little in boxes. Long-leaf pine constitutes about $1\frac{1}{2}$ per cent of the stuff used for boxes, but there is a great deal available. Oaks constitute about 1 per cent of the material used for boxes, but there is a great deal available. Douglas fir constitutes about one-sixth of 1 per cent of the lumber used for boxes, but enormous quantities are available.

The wooden-box industry, using 15 per cent of our lumber cut, earnestly supports the Forest Products Laboratory and urges that both the box testing and all lines of work be fully financed, and

urges an appropriation of not less than \$500,000, the amount recommended by the several forest-products associations.

Mr. ANDERSON. Where do you get that figure?

Mr. NELLIS. In order to save time I was just omitting a little explanation. It urges an appropriation of not less than \$500,000.

Mr. ANDERSON. Where do you get that figure?

Mr. NELLIS. The several national forest-products associations, the National Lumber Association, the Wood Preservers' Association, the National Pulp and Paper Association, the American Institute of Architects, and the Chicago Association of Commerce, and perhaps one or two others that I do not think of now formed some time ago—three months ago, or last summer—a committee known as the Forest Products Committee, which had its headquarters at Chicago, because most of the men on the committee lived there or near there. For some time they had been studying the needs of the Forest Products Laboratory, and it has been their conclusion that to properly support the work and extend it as needed the appropriation should not be less than \$500,000.

Mr. JONES. Do you mean this lumber is going to waste now; that it is not being utilized at all?

Mr. NELLIS. No, sir.

Mr. JONES. If the lumber is being utilized, if all grades of lumber that the mills are cutting are being used in the market, what is the need of this investigation?

Mr. NELLIS. My answer to you I do not believe was entirely accurate. Not being a lumberman, I can not tell you what per cent of the low-grade production does not leave the mill.

Mr. JONES. I can understand why the Government should be interested in making an investigation as to the use of wasted lumber, in the lumber interest or in any other interest, as a matter of conservation. But if everything that comes out of the log is being utilized, I don't see the necessity for this investigation and this expenditure of money.

Mr. NELLIS. I think if you were to ask an oak lumber manufacturer if he ships all of his lumber from his mill, he would tell you that he had to leave his No. 4 common at the mill.

Mr. JONES. What?

Mr. NELLIS. All his oak. That is what I heard some time ago.

There is an element that I did not mention, perhaps because I did not want to confess it; there is competition in the box business between the manufacturers of different kinds of containers, and in the fact that the use of the fiber board container has developed tremendously. As lumber increases in price at times that container bobs up a little more. As paper and pulp goes up, the lumber comes to the fore.

Mr. JONES. As softwood goes up they use hardwood culls, do they not?

Mr. NELLIS. That is true.

Mr. JONES. They fluctuate to meet a market condition, but in any event all the lumber is utilized?

Mr. NELLIS. I think, generally speaking, most of the lumber is utilized, yes.

Mr. JACOWAY. What do you call No. 4 common?

Mr. NELLIS. It is the lowest grade of the wood, I believe.

Mr. JACOWAY. I did not know that there was a No. 4 common.

Mr. NELLIS. As I recall, it is the lowest grade ever put out by a hardwood association, and perhaps they have abandoned it. That is something upon which I am not well informed.

The CHAIRMAN. The culls are being used for the manufacture of boxes?

Mr. NELLIS. I understand a great many mills in the South, perhaps some of the Western States, are still running their large burners to get rid of a certain proportion of the slabs and waste which they can not use under their own boilers.

The CHAIRMAN. The stumps are used for shingles where they are cut high?

Mr. NELLIS. It depends on the species, I would say.

The CHAIRMAN. What is to be added to this laboratory in Madison?

Mr. NELLIS. As interested particularly in the box industry, I can not speak authoritatively about the other interests. But I understand this—

The CHAIRMAN. What progress is being made in the box industry and what is desired further than what is being done?

Mr. NELLIS. This laboratory has set up four groups of about 50 box woods with a little difference in the construction of the boxes from the different woods. We ought to have more grouping than that.

The CHAIRMAN. I think we all appreciate the importance of the work that is being done, but the question is how much ought it to be increased, if at all.

Mr. NELLIS. I have one more paragraph in the statement. The box-testing apparatus at the laboratory is now housed in a remodeled old barn, detached from the laboratory and not well located. The importance of the work deserves much better housing. Further, I understand the former efficient box-testing organization is now practically disbanded, since money available has been insufficient to allow trained engineers to be kept on box testing, and, in addition, I understand several trained box-testing engineers have within the last year resigned to accept better situations elsewhere. I understand the present appropriation allows box testing to be done only at occasional periods and that a well-planned program can not be followed. The box industry needs badly a schedule to follow in constructing, nailing, and strapping boxes to hold different weights of different commodities, especially for export. Those things are worked out largely by a man's experience, and a man's experience is not always the best thing to base things on. The laboratory is the only source of such information for the whole box industry.

In order to adequately operate the box-testing apparatus, the Forest Products Laboratory, I understand, must have its appropriation increased to \$500,000, so that the proportion allotted to box testing will be sufficient to operate the box-testing section continuously and at a rate commensurate with the needs of box manufacturers and shippers who use boxes.

I would like to add, Mr. Chairman, that within the last few months it has developed that we did not have tests on certain large lots of

boxes used in large quantities. The Railroad Administration was asking about it. They asked particularly about dry goods boxes, boot and shoe boxes, boxes for hats and caps, and they found that while there was general information available, nobody had made any tests on those particular boxes. So there is something that is needed, and I understand the laboratory did not have sufficient funds to complete such tests for the Railroad Administration, and they did not feel that they ought to undertake it, and, as far as I know, these particular tests are still on the program, pigeonholed.

Mr. McLAUGHLIN of Michigan. Does your association or any of the members contribute anything for the making of tests for these individuals?

Mr. NELLIS. I would like to answer your question backward. When box tests are made the results are used by box manufacturers, and, to a large extent, they benefit the shipper or the man who uses the boxes. He saves in freight on a lighter box, or he gets a stronger box, and he makes or holds a customer down in South America. Answering the first part of your question, the National Association of Box Manufacturers is contributing now to the box-testing laboratory at Madison.

Mr. McLAUGHLIN of Michigan. How much?

Mr. NELLIS. I can not tell how much. It is handled by the Chicago office.

Mr. McLAUGHLIN of Michigan. How long has that contribution been made?

Mr. NELLIS. For a period, I should say, of between three and six months; since July 1 at least.

Mr. HUTCHINSON. What do you mean by testing a box, testing a sample?

Mr. NELLIS. It is a sample box, but nevertheless it is constructed in the way a regular box would be constructed, and if it can not be loaded with what the regular box would carry it is loaded with a similar weight. If it is a canned goods box it gets a load of tin cans holding water. As far as possible they put in the identical article.

Mr. HUTCHINSON. Why is it necessary to use thousands of a particular crate? Why would not one or two do?

Mr. NELLIS. The \$500,000 has to be spread over the entire work, and the laboratory tests of boxes are conducted in a little barn. I do not know whether it gets 5 per cent or 10 per cent of the amount.

Mr. HUTCHINSON. What do they do in testing a box?

Mr. NELLIS. The testing machine for testing boxes is a large iron drum, of hexagonal shape, about 14 feet in diameter and about 7 or 8 feet wide, of hexagonal shape with six faces. On each face there is a slot, or a projection or a bump. The box is put in there, constructed and nailed as it would be in practice, or changed somewhat to find out how it should be improved. The drum is rotated. The whose machine is designed especially, the bumps and battles and projections, so that the box gets most of the things that happen to it in transportation. If it falls on a projection, as it might on the corner of another box in a freight car, or having a wagon tongue slammed into it, if the test is run long enough, it is so designed that it will fall on every side or corner or edge so that it gets any kind of a fall which it might get in actual handling.

Mr. HUTCHINSON. Supposing your box manufacturer does not make that crate? How does that help the trade any?

Mr. NELLIS. It seems to me that is another question.

Mr. HUTCHINSON. I do not think it is.

Mr. MCKINLEY. They are telling him how to change his box.

Mr. NELLIS. You are getting into another subject. Very often a box or crate can be improved and the box manufacturer can plead with the customer, asking him to do it, and he says, "I prefer to save a cent," and cents make a lot of difference in construction of boxes.

Mr. HUTCHINSON. Have you the price of boxes there?

Mr. NELLIS. No.

Mr. HUTCHINSON. You know they have gone up three or four times.

Mr. NELLIS. I think not quite that much.

Mr. McLAUGHLIN of Michigan. Where is this barn where the experiments have been carried on?

Mr. NELLIS. The laboratory is on one of the principal streets. The barn is near the railroad track.

Mr. McLAUGHLIN of Michigan. It is in Madison?

Mr. NELLIS. It is on the track west on a muddy road.

Mr. McLAUGHLIN of Michigan. Do you know that at the time the laboratory was established at Madison the authorities there agreed to erect such buildings as were necessary at their own expense?

Mr. NELLIS. I understand that, yes; and I will admit that the box-testing machinery was not moved to this old barn until the war came on.

Mr. LEE. What is this barn constructed of? You say it is a barn.

Mr. NELLIS. It is a good old lumber barn, remodeled as I stated.

Mr. CANDLER. A wooden barn?

Mr. NELLIS. Yes, sir.

The CHAIRMAN. Are you through with your statement, Mr. Nellis?

Mr. NELLIS. Yes.

The CHAIRMAN. Thank you, Mr. Nellis. Your hour has been consumed. Mr. Ash, how much more time do you want?

Mr. ASH. Two more short statements.

Mr. CANDLER. How long will they take?

Mr. ASH. About 5 minutes for the others.

The CHAIRMAN. Very well. We will hear Mr. Kemper next.

STATEMENT OF MR. EDWARD C. KEMPER, EXECUTIVE SECRETARY, AMERICAN INSTITUTE OF ARCHITECTS.

Mr. KEMPER. Mr. Chairman, I am here as the Executive Secretary of the American Institute of Architects. Our technical representatives in this matter, Mr. Elmer C. Jensen, a member of the Forest Products Committee to which Mr. Nellis referred, was unable to get here from Chicago, and I desired to submit a brief statement on his behalf and on behalf of the American Institute of Architects.

The American Institute of Architects, the national organization of the architectural profession, desires to go on record as heartily endorsing the research and laboratory work which has been conducted

during the past year by the Forest Products Laboratory in the Department of Agriculture.

The architects, the engineers, and the other building interests of the country do not have authoritative information on wood and wood products, as used in the building industry, to the extent to which they should have it.

The Forest Products Laboratory is doing valuable work in supplying this information, and in view of the building situation in the United States its scope and service should be expanded.

The representative of the American Institute of Architects in this matter, Mr. Elmer C. Jensen, a successful architect in Chicago, Ill., has made a study of the problem from the architect's point of view, and we urge, on his recommendation, that the appropriation of \$348,000 asked for by the Secretary of Agriculture for the Forest Products Laboratories be made \$500,000.

Mr. ANDERSON. The gentleman referred a moment ago to some difficulties with the other departments. I want to ask him a question.

Mr. ASH. This is not coming out of our time, I understand, Mr. Anderson?

Mr. ANDERSON. No, sir. But you are getting more time than you asked for now. I see reference has been made to the difficulties of the lumber companies. Do all of these associations think Congress ought to reduce the expenditures for the operation of the Federal Government?

Mr. KEMPER. You are asking a question which should be addressed to another witness before this committee. I did not refer to the other departments.

Mr. ANDERSON. But do you think so? You are asking us to increase this appropriation. We are being asked on every side to increase appropriations. We can not increase appropriations and reduce expenditures. What we would like to know is whether all these associations which appear here this morning want us to increase the appropriations or reduce them.

Mr. KEMPER. The American Institute of Architects wants you to increase the appropriation for this particular work. We feel that the building industries of the country generally would benefit if they had more complete and reliable information on the tensile strength of the various kinds of lumber, and on the unusual properties of certain kinds of woods which make them peculiarly suitable for certain conditions or building problems.

Mr. ANDERSON. Most people are in favor of things that they can have done them for nothing. It ought not to be a matter of surprise that these associations are in favor of the increase of this appropriation. The question that we are really up against is increasing this appropriation and hundreds of other appropriations and still keeping within the revenues. We have requests to increase the appropriations and still we have no increase in revenues.

Mr. KEMPER. Does not this resolve itself into a question of relative values? From our point of view, we feel that this \$500,000 would benefit the whole people. The building situation in this country is bad. As everyone knows, the cost of all construction work is high, and anything that would help to lower that cost or help keep it

down to the present level would be of vital interest to the building public.

Mr. ANDERSON. You never have had so much help as last year, and yet you still ask for an increase.

Mr. KEMPER. A great deal of such help received last year by the laboratory and other Federal bureaus went for war activities. It did not help the average taxpayer if he wanted to build. For two years it was considered unpatriotic to build a house or any other structure not essential to the war. Now, all that accumulation has to be taken care of. It has been damned up and sooner or later it must break loose.

Mr. CANDLER. May I ask a question along the line of Mr. Anderson's question? Does your association favor a uniform plan for public buildings and for reducing our expenditures in the amount of money we expend for architectural work in the construction of post offices throughout the country? [Laughter.]

Mr. KEMPER. That question is hardly germane to this particular subject, but I will gladly answer it if the Congressman desires it.

Mr. CANDLER. It is germane to the question Mr. Anderson asked about expenditures.

Mr. KEMPER. I will say that the American Institute of Architects is absolutely opposed to the present system of constructing public buildings in the United States. We believe it is a pork-barrel system and that it should be changed. [Laughter.]

Mr. CANDLER. Do you believe that a uniform post office, costing a certain amount of money, should be built throughout the United States?

Mr. KEMPER. We believe that certain uniform standards in the construction of post offices should be followed, but we do not believe that the Federal Government should have two or three or four types of plans for the whole of the United States, and that a particular plan should be used for any post office costing, say, \$100,000, regardless of whether it is to be located in southern California or Portland, Me.

Mr. CANDLER. Then you do not approve of two or three plans, according to which all post offices must be built?

Mr. KEMPER. No; but we do approve of certain uniform standards which have been discussed before other committees of the House.

Mr. CANDLER. I am glad to hear that.

The CHAIRMAN. Thank you, Mr. Kemper. We will now hear Mr. Schnatterbeck.

STATEMENT OF MR. CHAS. C. SCHNATTERBECK.

The CHAIRMAN. Whom do you represent?

Mr. SCHNATTERBECK. The American Wood Preservers' Association.

The CHAIRMAN. You may proceed.

Mr. SCHNATTERBECK. The American Wood Preservers' Association membership consists of city engineers, railroad men, private engineers, chemists, foresters, and lumbermen. The association numbers about 300 and some odd. At its last annual convention

the association passed a resolution favoring the maintenance of the Forest Products Laboratory. I will read the resolution [reading]:

Whereas the Forest Products Laboratory has in the past contributed data of inestimable value to our industry, but has during the war confined its efforts to the problems of airplane construction: Be it

Resolved, That this association urges that they resume their researches in the wood-preserving industry.

Wood preservation means wood conservation. The investigations of the Forest Products Laboratory have been of great value to the men who are trying to conserve our forest resources. Their investigations of the toxic value of preservatives that are used in treating wood to protect it against rot have helped to prolong the life of that wood anywhere from 50 to 100 per cent. The railroads to an extent are largely benefited by this movement. They are among the largest consumers of wood in the country for crossties, of which they consume about 125,000,000 a year, one-third of which are treated, bringing about a material saving to the railroads.

In other lines, in the cities, for instance, where we have block paving, the life of the pavement, the durability of the pavement, and the service rendered by that pavement is prolonged through the treatment of these blocks with creosote and other preservatives.

Investigations have also been conducted in regard to treating piling in order to prevent docks and piers from rotting and to protect them against marine borers. There are committees that are investigating the problem of piling, treating piling so as to make it last anywhere from 20 to 40 years that otherwise would last only 3 to 5 years.

The American Wood Preservers' Association is very anxious to do what it can to cooperate with the Forest Products Laboratory to propagate the principles of wood preservation, which is not alone for selfish purposes, but to be of universal use, and we all sincerely hope—the executive committee of the association as well as the members who passed this resolution—that the gentlemen will approve the appropriation.

If there is any question that I can answer, I shall be glad to do so.

Mr. CANDLER. Do any of these associations contribute any funds to this work in cooperation with this laboratory?

Mr. SCHNATTERBECK. No, sir. The American Wood Preservers' Association is hardly self-supporting. It is not an organization to make money. Tree conservation and the saving of our national resources is one of the objects of the association, and therefore we are very anxious to have the Forest Products Laboratory help us in this.

Mr. JONES. Who composes that association?

Mr. SCHNATTERBECK. The members are city engineers, railroad men, railroad engineers, chemists, and men who are, directly or indirectly, interested in conservation movements.

Mr. LEE. What does it cost to treat a crosstie?

Mr. SCHNATTERBECK. About 30 cents. It depends upon the process.

Mr. JACOWAY. In the treatment of piling, have you found anything better than creosote?

Mr. SCHNATTERBECK. No, sir.

Mr. JACOWAY. Is that as far as you have gone in the investigation of preserving wood?

Mr. SCHNATTERBECK. Yes, sir.

Mr. JACOWAY. You know of nothing else better than that?

Mr. SCHNATTERBECK. No, sir. It will waterproof it, and it will not leach out of the timber as other preservatives of wood.

The CHAIRMAN. Thank you, Mr. Schnatterbeck. We are grateful to you, Mr. Ash, and gentlemen. We will now hear Col. Graves further on this subject.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF FOREST SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Mr. McLAUGHLIN of Michigan. In connection with the Forest Products Laboratory, do you detail any men to work in the laboratory or collaborate in any way with it? Is any part of the expense incurred at Madison contributed by you and carried in any of these other appropriations?

Mr. GRAVES. Only such incidental expenses as might come in the general direction of the whole Forest Service.

Mr. McLAUGHLIN of Michigan. How much money?

Mr. GRAVES. It would be a very small part of my time and the expenses of myself or associates in Washington who visit the laboratory.

The CHAIRMAN. What have you to say as to these figures?

Mr. GRAVES. Would you like to dispose of this item at the present time?

The CHAIRMAN. Yes. There is an increase of \$175,000.

Mr. GRAVES. When I presented this request to the Secretary of Agriculture for an increased appropriation for the Forest Products Laboratory, he asked me whether I could justify it as an urgent need of the Nation to-day in the light of the present financial conditions of the country. The work is so directly related to the prevention of waste and to the saving resulting from economies in the use of wood that I felt it was my duty to urge the request and that the proposed expenditure is fully justified.

In answer to the question which was asked during this hearing regarding the work during the war, we received contributions from the Army and from the Navy amounting in the aggregate to \$463,092, covering the fiscal years 1918 and 1919.

The CHAIRMAN. State the amount by each, if you have it.

Mr. McKINLEY. You had better state it by years also.

Mr. GRAVES. The War Department contributed \$271,000 and the Navy \$118,000 for the fiscal year ending June 30, 1919. For the fiscal year ending June 30, 1918, the War Department contributed \$63,545.25 and the Navy \$10,546.75. This was for special studies in aircraft, in box work, and other features connected with the use of wood by the Army and Navy.

Mr. McKINLEY. And all those studies were made in Madison?

Mr. GRAVES. Yes; they were made by our laboratory at Madison.

Mr. ANDERSON. Have they been completed?

Mr. GRAVES. They have not yet been completed, and this fiscal year the Army has contributed \$40,000 and the Navy \$100,000 for the continuance of some of the investigations.

Mr. ANDERSON. Do you know whether or not they contemplate making any contribution for the next fiscal year?

Mr. GRAVES. That question has not been taken up.

The CHAIRMAN. You said this year.

Mr. GRAVES. The current fiscal year.

The CHAIRMAN. \$40,000?

Mr. GRAVES. \$40,000 from the Army and \$100,000 from the Navy.

Mr. ANDERSON. Is this investigation in relation to the industry generally, or are the results likely to be of value only to the War Department and to the Navy Department?

Mr. GRAVES. Practically no investigations have been made which will not have a direct bearing on peace-time conditions, although all were undertaken because of some urgent and specific military need. Of course, some of the aircraft work is not as pressing as in war time, but it is still greatly needed in the constructive work of the Army and the Navy and for the industry that is constructing aeroplanes, and the principles evolved have a wide application in other wood uses.

Mr. ANDERSON. I do not want to anticipate your statement, but, lest I forget the question, I want to ask you whether the experience which you have already had in connection with this box-testing business shows that there is any general acceptance on the part of the box manufacturers of the results of these tests?

Mr. GRAVES. The box manufacturers have adopted specifications on the basis of these tests in a number of important instances. The Army used our specifications in connection with boxes for shipping ordnance and other materials of various kinds. The assistance was asked because the Army could not get boxes in adequate quantities. The new specifications prepared by the Madison Laboratory made available a long list of substitute woods that were quite satisfactory and available. I have and can insert into the record, if you wish, some definite illustrations of the saving to the Army in materials and shipping space resulting from the work on boxes during the war. The results of the box tests have been very real.

Illustrations of saving to Army by box investigations at the Forest Products Laboratory.

Commodity.	Containers. ¹		Remarks.
	Saving in space.	Saving in lumber.	
	<i>Per cent.</i>		
Artillery wheel harness.....	26	26 per cent.....	Box equally serviceable.
Artillery lead harness.....	28do.....	Do.
Ration container.....	10½	Slight.....	Much more serviceable container.
4.7-inch high-explosive shells.....	20	20 to 30 per cent.	More serviceable, more easily handled, cheaper, less weight.
Intrenching hand axes.....	32	Slight.....	Just as serviceable.
Shipping case for 142 pounds cannon powder.	14	Same amount used.	More serviceable.
Box for short-handle round-nosed shovels.	9	Slight.....	Do.
Intrenching pick-end mattocks.....	7do.....	Just as serviceable.
Box for two Browning automatic machine rifles and equipment.	28	28 per cent.....	Do.
United States rifles.....	25	20 per cent or more.	Do.
Boxes for two Browning machine guns and equipment.	17	Slight.....	Do.
Box for 6-inch Stokes trench mortar shell.	15	32 per cent.....	More serviceable and more convenient.

¹ The data given regarding space and lumber saved is based on a comparison of the original container with those developed at the Forest Products Laboratory.

Mr. McLAUGHLIN of Michigan. The manufacturers made boxes according to specifications for the Army and Navy. It was necessary for them to do that. But, in line with Mr. Anderson's question, did box manufacturers approve the suggestions of the laboratory as to the boxes and follow those suggestions in the making of boxes for the trade where they were not bound down by specifications as they were by the Army and Navy?

Mr. GRAVES. Oh, yes; there has been a widespread acceptance by them. I can not say that all box manufacturers have accepted the specifications. I do not think that would be true. But various box associations, the National Grocers' Association, the National Cannery Association, and other shippers have adopted the laboratory specifications.

Mr. ANDERSON. The thing I am trying to get at is this, Col. Graves: My impression is that the utilization of material for whatever purpose—character of manufacture, everything of that sort—depends very largely on the possibility of getting the articles, the raw material, and on the economic conditions of competition, than upon experimentation as to what it is best to use under certain circumstances. If you have not the raw material you can not use it. If competition is such that they can not conform to specifications, they will not do it. Consequently there is some question in my mind as to how much value there is in research of this sort.

Mr. GRAVES. We must remember that wood is essentially a different kind of material from many other structural materials, like cement, steel, and so on, except in the case of pulp, wood is not broken down and reformed like cement or steel. There are a very large number of different species and a wide variation in the quality of the wood that comes from different species. There is a great deal of uneconomical use of wood and consequent waste due to ignorance of the qualities and value of kinds of wood and of grades not commonly in the market.

Mr. JONES. Colonel, following that same thought, and probably along Mr. Anderson's line of thought, does not the user of wood apply himself to what he can get? For instance, down in the hard-coal regions for years and years the miners would use and wanted to use soft wood in their cribbing and different places in the mine, largely because it was lighter, easier to nail, and gave them less trouble in putting it up. When soft wood became scarce in the eastern hard-coal market, hardwood manufacturers who were unable to find a market for their cull lumber went to the hard-coal operators and prevailed upon them to use hardwood. They took the hardwood because they could get it. They could not get soft woods, and, irrespective of the wish of the miners or their preference for soft wood, as it was easier to handle, easier to put up, they do use hardwood. Is it not a fact that the people who manufacture different kinds of lumber, who have different kinds of wood, see to it that they get a market for this stuff even to the extent of going out and prevailing upon users of other kinds of wood that they can use this particular kind? That is true with reference to boxes even now, though manufacturers prefer soft wood. It is better to put the hardwood to use because they can not get soft wood.

Mr. GRAVES. That is true to a certain extent.

Mr. JONES. Is it not true that these woods are being utilized because of the availability of the wood rather than through experiments that have been made for the use of these woods?

Mr. GRAVES. Only to a certain extent, I believe. I think the question of lack of information, in regard to different woods among engineers, among architects, among municipal engineers who draw our building codes, and among wood users generally is responsible for a great deal of lack of economy in wood utilization.

Mr. JONES. That is true, but do you suppose that the manufacturers of one particular kind of wood are not going to use every effort to see that their finished product is being utilized? Is there any justification for the Federal Government coming in and telling them that they will go out and make experiments in a particular product in order to furnish for them a market for it?

Mr. GRAVES. The necessity for the investigations was certainly shown in the case of aircraft and in the testing of boxes, and these studies have resulted in a very great saving.

Mr. JONES. Why, in your opinion is it necessary for the Federal Government to spend money to develop the sale of the articles manufactured by private interests, especially in lumber, where they can sell anything that they make?

Mr. GRAVES. I do not think that is the purpose or the immediate effect of these investigations. It is for the purpose of extending information regarding the wood, the quality of wood, the basis for grading, etc. From a public standpoint there is a direct relation to the forest and the extension of the life of our reserve supplies of timber. It is this rather than the purpose of benefiting some special industry. I might illustrate this by what we are doing with built-up materials through splicing and lamination. People are not going to begin to use laminated articles made of small pieces of wood unless it can be shown that they are strong and have qualities to meet their requirements.

Mr. JONES. I can understand how, where the Government uses railroad ties or uses piling or any other kind of timber, you would want to experiment on materials that would preserve the life of these things, but what is true of the Federal Government doing that is equally true of the private interests doing it. There is just as much interest on the part of the railroad corporations themselves in making experiments with preservatives to prolong the life of railroad ties, and it does prolong the life from 5 to 14 years. It does prolong it, but the private interests have just as much at stake in developing these experiments as the Federal Government has. Why the Federal Government should make the experiments for the benefit of the private interests is more than I can understand.

Mr. MCKINLEY. Might I ask Mr. Jones why we have the Department of Agriculture?

Mr. JONES. If you want an answer, I will say I do not know.

Mr. LESHAR. That is what I am trying to find out.

Mr. JONES. Yes; that is what I am trying to find out.

Mr. GRAVES. We certainly should have basic information regarding the strength and other qualities of the wood of different species. We should have basic information regarding the effect of wood preservatives on the strength of wood.

Mr. JONES. True.

Mr. GRAVES. Should not that be done by a public laboratory? Can that be left entirely to private initiative, to companies each of which has some particular problem, some particular process, some particular question that it wants to work out for its own benefit rather than to get this information for the benefit of all the engineers or the wood associations all over the country?

Mr. JONES. In answer to that I would say that if some particular railroad corporation has to determine the way ties are benefited, it would not be long before the other railroads would be using it. I think the public would get the benefit of anything that private interests established, unless there is some secret process about it. I do not think you need worry about the public getting the benefit of everything that is found out. They get it in other lines.

The CHAIRMAN. Colonel, is that all you care to say about this subject?

Mr. GRAVES. Mr. Chairman, there has been a great deal already said regarding what has been done at the laboratory along different lines. I do not know whether you wish to have me describe this work, which would be more or less a repetition of what has already been said.

The CHAIRMAN. Colonel, what urgent demand is there for the increase? Is there any new line of activity to be taken up?

Mr. GRAVES. Most of the work will be along the lines which have already been started. It is to extend the work and to bring about the application in practice of the many principles which have already been established.

The CHAIRMAN. Are the Navy and War Departments going to continue their work?

Mr. GRAVES. We shall continue the work on those special war features if desired by the Navy and War Departments.

The CHAIRMAN. At the expense of the other departments?

Mr. GRAVES. At the expense of the other departments, where the work is done especially for them.

The CHAIRMAN. It will be left to the discretion of the department whether it is to be continued?

Mr. GRAVES. Yes.

The CHAIRMAN. And if the department makes use of it, it ought to contribute to it?

Mr. GRAVES. Yes, sir; and, of course, a great deal of our work is of direct benefit anyway to those departments.

The CHAIRMAN. Then you propose to extend the work along those lines?

Mr. GRAVES. Yes.

The CHAIRMAN. We have a number of communications on the subject. There seems to be an urgent demand for an increase in this item. The increase asked for is very large. We would like to know just why the increase should be granted.

Mr. GRAVES. I think, if I can briefly summarize the different lines of work which would be involved in this increase, it will answer your questions, and then I can file with the committee additional detailed information.

The CHAIRMAN. If you can do so briefly, state why the appropriation is increased.

Mr. GRAVES. We wish, first of all, to extend the work of testing the mechanical properties of wood. The proper use of wood in general construction or other purposes where strength is a factor depends on a knowledge of its mechanical properties. Moreover, it is important to test the strength of woods that are subjected to various treatment like kiln-drying, use of wood preservatives, and the application of fireproofing materials. These may have an effect on strength.

We wish further to make additional tests on the built-up or fabricated beams and columns and on such materials as plywood and articles made by gluing together small or thin sections of wood. Lamination presents a big possibility in the use of the smaller materials where to-day we are using high-grade lumber from the original forests. There is thus offered a very great opportunity for the saving of material and reducing the drain on our forests.

The CHAIRMAN. What have you accomplished along that line?

Mr. GRAVES. Most of the work has been done in connection with the war. Thus, in constructing parts of airplanes, large, perfect pieces, taken mostly from the Pacific coast, were formerly used. As a result of our experiments, the Army and Navy, about the close of the war, had already accepted our specifications for splicing and lamination in the construction of the beams and other parts of airplanes. This meant a great saving of highly specialized and costly wood. We have been experimenting with parts of vehicles, with the idea of a built-up tongue, bolsters, and other parts of wagons and other vehicles. If this can be worked out it will be of great importance, because of the growing shortage of hardwoods. I think some mention was made in the hearings of shoe lasts, athletic goods, and a great variety of articles which now require the use of very high-grade hardwoods and other species. They now require solid blocks of high quality, which can be perfectly well built up by the use of small or thin material. Without knowledge of the strength and reaction to various kinds of stress, manufacturers and users will not adopt these devices. They will be conservative, still drawing upon distant and expensive supplies, when they might be using material nearer at hand and producing an article as serviceable as that from the highest grade virgin trees. The same principles apply to getting into use species of trees now little known. Their use reduces the drain on the forests as a whole. The studies in mechanical properties of wood lay the foundation for such economic forest utilization.

The next heading is that of kiln drying. There is certainly a great loss in an unintelligent seasoning of wood. This loss has been estimated at from \$25,000,000 to \$50,000,000. I believe that it is nearer the latter figure. Half of the loss is unnecessary.

Mr. JONES. That waste of kiln drying is accounted for in what way? What is the waste in kiln drying?

Mr. GRAVES. There is an unnecessarily large amount of checking in the drying, partly due to defective kilns, partly due to poor operation. The operators of the kilns often do not know how to meet special conditions, so that the material comes out of the kiln with a very much larger loss in checking than is necessary. Such work as we have already done certainly demonstrates that a great reduction in this loss is possible. It is a question of intelligent application of the principles of kiln drying to different species.

Mr. JONES. Are not the kiln-drying manufacturers, the manufacturers of dry kilns, experimenting on that?

Mr. GRAVES. To some extent; but they are not getting at the basic facts and fail usually to attack the problems that depend for their solution upon a knowledge of some very complex physical laws. The loss certainly continues and I believe will not be remedied without investigations and demonstrations by such a public agency as the Forest Products Laboratory.

The CHAIRMAN. You have referred to a most important feature. Will you include the other suggestions in your remarks or do you wish to go on with your statement?

Mr. GRAVES. I will be very glad to file this material in the text of the hearings if you wish to save time.

Mr. HUTCHINSON. In 1919 you had 417 men on this work and the salary list was \$70,000. Now you have 201 men and the salary list is \$269,000.

Mr. GRAVES. Of course, this apparent discrepancy is due to the special work for the Army and the Navy. Many of our regular force worked part time on the military problems that were paid for from Army and Navy funds.

Mr. HUTCHINSON. This statement ought to be put in so we can understand it. You say 417 men, \$70,000. Now you have 201 men and the salary list is \$269,000. It does not appear very good.

Mr. GRAVES. That was a question of bookkeeping. The men who are paid part or all of their time from the regular fund are recorded here. So many devoted part time to Army and Navy work that the actual number of employees is large. The other part of their time was paid from the cooperative funds from the Army and Navy.

Mr. HUTCHINSON. Ought not this statement show where the salary comes from?

Mr. GRAVES. We would have to add another column showing the amount of the time that was charged against the Army and Navy work. To that extent the statement is incomplete.

In addition to the strength tests of plywoods and other laminated materials which have been mentioned, a large amount of work is necessary on the technique of their construction, including the development and application of more satisfactory and dependable glues, and the selection of materials, involving such questions as the extent to which low-grade materials may be substituted for high-grade materials for particular classes of uses. This is practically a new field in which the possibilities of decreasing the reduction of waste are so great that a large amount of work is justified.

It is estimated that unnecessary loss as a direct result of poorly designed and poorly constructed containers amounts to approximately \$100,000,000 for domestic shipments alone. The public pays this bill. Poor methods of boxing, crating, and packing are reported by the Consular Service to be interfering seriously with the development of our export trade, and the unnecessary losses here are also very large.

The public, shippers, and purchasers of practically all classes of commodities, exporters, railroads, and express companies, other Government departments, as well as box and lumber manufacturers, are keenly interested in getting additional information which will reduce this great loss. An illustration of the interest in this work is a meet-

ing held at Chicago early in December where not less than 600 merchants and others met and considered this problem for an entire afternoon with particular reference to the improvement of containers, boxes, and crates made of wood.

I have spoken of some results already obtained. I would like to supplement this by saying that the application by the War Department alone during the war of results secured in our tests saved to the United States much more than the entire cost of all forest products investigations which we have made.

What are most needed now are tests on an increased scale to develop the fundamental laws governing the relation between kinds of woods, thickness of material, methods of nailing, strapping, cleating, etc., the size of the containers, and commodities to be shipped. These tests should be made for such different classes of containers as wooden boxes, solid and corrugated fiber boxes, crates, etc. The public benefit to be derived from such tests will cover their cost many times over. The universal demand is that the work be done by a single authoritative impartial agency such as the Forest Service.

The total loss in the production of lumber is very great. Of the material in the tree about one-third actually appears in the form of seasoned rough lumber. There is additional waste which ranges from 10 to 35 per cent or more, and averages conservatively 25 per cent. In such an important industry, for example, as vehicle making, the single operation of bending heavy oak often results in a loss of 50 per cent of high-grade selected material. On the average, for every board foot of lumber that goes into a finished product at least three times as much material is wasted. Practical considerations make difficult a reduction of this loss where the only product is boards.

The manufacture of by-products by various chemical industries offers the best and most feasible means of cutting down this waste. The public interest in reducing this waste is greater than that of any single industry, and the problem will be attacked comprehensively by no other than a public agency. The chemistry of our American woods must be studied exhaustively in its bearing on the use of waste in the distillation of hardwoods, and the manufacture of paper, alcohols, and other chemical products.

The chemical studies include those preservatives which are of great importance in extending the life of railroad ties and other articles. Preservatives not only prolong the life of treated woods but make it possible to utilize less durable species in place of those now used. If full use were made of preservative processes in treating ties, poles, posts, piling, mine timbers, shingles, and lumber which is to be exposed to the weather, it would probably be possible to reduce the drain upon our forests by several billion feet, worth in the neighborhood of \$75,000,000. Similar striking figures could be given for saving from loss by fire by the development of practical and reasonably cheap fire-retarding or fire-resisting wood coating or paint. The loss by burning of wooden structures in the country is something like \$2,000,000 a year.

One of the points where our industries to-day are failing is in connection with industrial processes with particular reference to raw materials. It is essential that the Forest Products Laboratory have information regarding industrial processes in making their basic research practically available. To apply strictly laboratory investi-

gations and to determine how they can be made to improve industrial processes and reduce wastes and costs, it is necessary to know what these processes are that are now in use.

This applies to such industries as the pulp industry, distillation of hardwoods, processes of turpentine particularly in the woods, and in lumber manufacture itself. Present practice in most of the wood manufacturing and using industries is at present based largely or entirely on rule-of-thumb methods. Some questions as the grading of lumber, which is now chaotic, will never be worked out satisfactorily until the public requirements are taken into account by some public agency such as the Forest Service.

It is to reduce the losses indicated in the foregoing that makes it urgent to extend the investigation work at the laboratory. Every foot of lumber saved means a reduction in the drain on the forests and our waning supplies of high-grade material.

I believe that these investigations should be undertaken by the Federal Government. Wood was one of the materials earliest used by man, and to-day practically its entire manufacture and use is controlled by rule-of-thumb methods. In short, when left to individual initiative nothing in the way of scientific research has been done, and little or nothing will be done if left to private initiative. Public action is just as necessary in these directions as in agriculture and for much the same reasons. Enough has already been accomplished by the Forest Products Laboratory with a very inadequate force at its command to show the value and the necessity for such work. One of the great lessons of the war has been the value of research, and the nations which win out in post-war competition will have to base their industry on the results of technical investigations. This is just as true of the wood-manufacturing and wood-using industries as any others. The question is one of public interest even more than of interest to the industries themselves. In due time the industries can be forced to do a great deal of work themselves, although it will always be necessary for the Government to conduct the more fundamental studies. We can make our wood industries the most or the least efficient and progressive in the world by the extent to which we furnish a technical basis for their methods and utilization.

The work we have done demonstrates its value. The demands for its extension by wood users indicates its practical usefulness. In many cases the work is fragmentary and on too small a scale. It is to enlarge and extend it, and to get the results into practice, that we need additional funds.

MORNING SESSION CONTINUED.

THURSDAY, DECEMBER 18, 1919.

FOREST SERVICE—Continued.

**STATEMENT OF MR. JAMES T. JARDINE, INSPECTOR OF GRAZING,
FOREST SERVICE, DEPARTMENT OF AGRICULTURE.**

The CHAIRMAN. What is next, Col. Graves?

Mr. GRAVES. I have asked Mr. Jardine to explain the purpose of item 245, page 132, "for experiments and investigations of range conditions within national forests or elsewhere on the public range,

and of methods for improving the range by reseeding, regulation of grazing, and other means, \$60,000."

The CHAIRMAN. We will hear Mr. Jardine. Are you with the Forest Service, Mr. Jardine?

Mr. JARDINE. Yes, sir. The best way that I can explain the needs of this work is to say that we are developing, managing, and utilizing the grazing resources of the national forests on approximately 125,000,000 acres of the roughest country in the United States. Much of it as late as 1907 was considered nonusable; much of it was entirely overgrazed. Stock were handled in large numbers in ways that were entirely destructive to the vegetation. Since 1907 the demand for grazing has increased nearly double. The number of stock on the national forests has increased approximately 45 per cent.

Mr. McLAUGHLIN of Michigan. Within what time?

Mr. JARDINE. Since 1907. In 1907 range investigations by the Forest Service were first started. Those were about the first, if not the first, along this line in the world. One of the purposes was to investigate the possibility of improving the method of handling approximately 7,000,000 sheep over these rough mountain ranges, so as to minimize the damage to timber and to the watershed and to protect and utilize this grazing resource as fully as possible.

We did four years of investigation by simply living with the sheep and observing their natural habits, and as a result of these investigations we were able to suggest a change in the method of handling sheep which would increase the grazing capacity of the land about 15 per cent and the weight of lambs 5 to 10 pounds.

Another main purpose of the investigations begun in 1907 was to work out a system of range utilization based upon the character and requirements of the vegetation which makes up the range forage crop. The practice had been to turn stock onto the range without regard to numbers or proper season of grazing. Our work on the forest ranges was to determine the character of range best suited to sheep and that best for cattle; the seasons during which sheep range and cattle range should be grazed; the number of stock which might be grazed; and methods of securing natural seeding of the range as well as the possibility of seeding to cultivated forage plants. These investigations were conducted in one locality to determine fundamental principles. Then came the difficulty of convincing the stockmen and of working out practical means of putting these fundamental principles into application over the national forests.

Mr. McLAUGHLIN of Michigan. That word "investigation" is a very big word. What do you do?

Mr. JARDINE. In the handling of sheep, I personally was assigned to construct an animal-proof fence 100 miles from the railroad in some of the roughest country in America, where the methods of handling sheep were distinctive to the range. I was assigned to investigate the possibility of applying a paddock or pasture system of management similar to what is applied in Australia. I lived with those sheep from 4 o'clock in the morning until night for four summers, studying their natural habits when allowed their freedom under fence and what would be the result of interfering

with them by herders and of not interfering with them in the way of range-carrying capacity, growth of sheep, losses of sheep, and injury to the range.

Mr. McLAUGHLIN of Michigan. How did you interfere?

Mr. JARDINE. The custom was to have 1,600 to 2,500 head of sheep with one herder and two to six dogs. They were constantly rounding them up in a jam and spreading them out. This running and massing would trample out a great deal of the vegetation; sometimes 50 per cent of the vegetation was wasted in this way. The sheep were driven each day to and from a central bedding ground; they were driven 4 or 5 miles from the bedding ground to feed and back to camp. The result was just the same as it is when there are too many cattle collected together at one watering place; they kill the vegetation from the watering place out. In some instances the range was denuded for one-quarter to one-half mile around the bedding ground.

Mr. TINCER. You mean that they kill out the grass?

Mr. JARDINE. They not only kill out the grass but the trees, the small trees, and bring on erosion, which fills up the reservoirs below.

The CHAIRMAN. What is your remedy?

Mr. JARDINE. The remedy was this: That, instead of bedding those sheep at one place for 10 or 15 days at a time, we said that it was practicable to move them about over the range, that the sheep can be bedded wherever night overtakes them, and, instead of close-herding the sheep, the herders can keep out around them so that the sheep graze in open formation and minimize waste of forage by trampling. The herder can put four days' provisions on a burro and go out with the sheep. The herder gets up in the morning, makes himself a cup of coffee, and starts out with the sheep. About 9 o'clock they stop for rest. He will have a keg of water and some food on the burro. He will unpack the burro and fix his breakfast, and does his day's work. Probably about 3 o'clock the sheep start feeding again and graze until dark.

The CHAIRMAN. How about watering the sheep?

Mr. JARDINE. We have records of sheep going from the time they were lambs until they were marketed in Omaha without any water except the moisture in the vegetation, the dew, fog, and rains; with no places to drink from. It is not necessary to drive the sheep up and down steep hills every day to water, but they can work out and around and come naturally to water, that is, circle around from the water and back.

Mr. McLAUGHLIN of Michigan. In some cases they raise cattle in that way, and the cattle grow to maturity and make fine beef without ever having had a drink of water.

Mr. JARDINE. The amount of drinking water necessary depends very largely upon the character of vegetation, the altitude, the temperature, and the way the sheep are handled.

The CHAIRMAN. Do the sheep do so well without water as they do with it?

Mr. JARDINE. Not unless the vegetation is very succulent, and the atmosphere is cool, or there is a good deal of fog or rain.

Mr. McLAUGHLIN of Michigan. After you work out this proposition with your own men, what about the private interests; what do the people on the ranges do?

Mr. JARDINE. There is our big difficulty, and that is a point I was just coming to. The experiments were carried on in one locality to work out principles of management. Then local demonstrations are usually necessary to work out local variations in practice and to convince stockmen that the methods are practicable. At first stockmen believed that the methods proposed for handling sheep could not be followed. Now probably 60 per cent of the nearly 8,000,000 sheep grazed on the national forests are handled under that system, and that change has been brought about based upon these investigations.

In the handling of cattle we have even a more difficult problem than we have in the handling of sheep. The number of cattle grazed on the national forests since 1914 has increased 37 per cent. The ranges on which the cattle run vary, in some places, from 5,000 feet above sea level up to as high as 11,000 feet within 7 miles. You can imagine the variation in such range and what may happen from turning loose 2,500,000 stock when vegetation is ready at the lower limits of the range, without control of the movements of the stock. The result is that in some places the range is overstocked, and in some places it is understocked, but much of the range is grazed too early.

As a result of the war emergency the demand for range increased. We have now taken care of about all the stock that the ranges can carry under the present conditions and in some places too many. It is like taking a big farm without improvements. If you want to hold it without improvements, that is one thing, and reductions in number of stock may be necessary; but if you want to go on with improvements and efficient management and utilization, that is another.

The CHAIRMAN. How many miles of fence has been constructed by the Government.

Mr. JARDINE. About 1,600 miles for range improvements.

Mr. McLAUGHLIN of Michigan. What kind of fence?

Mr. JARDINE. The fences are usually of barbed wire, with three, four, or five wires. In some sections smooth wire is used.

Mr. McLAUGHLIN of Michigan. How near together are the posts?

Mr. JARDINE. The posts, ordinarily, are about 16 feet apart, although that varies a good deal according to the topography and the availability of materials. Sometimes they are closer together, but in the level country we ordinarily figure on about 16 feet.

The CHAIRMAN. Are you contemplating building more fences?

Mr. JARDINE. Yes, sir.

The CHAIRMAN. How much?

Mr. JARDINE. That comes under another item.

The CHAIRMAN. Can you give us the figures now conveniently?

Mr. JARDINE. The fences are not to be constructed out of this item.

The CHAIRMAN. Never mind if you have not the figures.

Mr. TINCHER. You had an appropriation of \$18,420 for 1912, and you are asking this year for \$60,000. What else is there that you want to find out about the sheep?

Mr. JARDINE. We started in on the sheep. Some experiments are being carried on to secure better methods of handling the sheep under

varying local conditions—the topography of the country, the timber, lack of water, predatory animals, and so on. We will have to continue investigations to work out the local adaptations of the general plan.

Mr. TINCHER. Are you attempting to improve the range by re-seeding?

Mr. JARDINE. This item covers the handling of cattle, handling of sheep, natural revegetation, artificial reseeded, water development, effect of grazing upon timber growth and watersheds, eradication of poisonous plants, and other problems incident to the regulation of grazing.

Mr. TINCHER. Have you reseeded any of these lands artificially?

Mr. JARDINE. We have conducted between five and six hundred tests, some successful tests in the mountain meadows and other areas where the soil and moisture are much better than average.

Mr. TINCHER. When the stock kill out the grass another grass crop will come in its place naturally?

Mr. JARDINE. That depends on the type of management and the length of time.

Mr. TINCHER. What percentage of this money is going to be expended on the forest reserves in investigations as to the natural grasses and reseeded?

Mr. JARDINE. At the present state of our information we are not going beyond the mountain meadows in seeding ranges to cultivated forage plants. I should say—I don't know—but probably not more than 5 per cent of the total area is of this character. We will not be able to go further until we have more definite information as to species best suited to the grazing lands.

Mr. TINCHER. What do you mean by mountain meadows?

Mr. JARDINE. In the national forests there are areas which are really meadows in character. They are small, varying from half an acre to possibly 100 acres or more.

Mr. TINCHER. Have you reseeded some of these meadows?

Mr. JARDINE. We have reseeded some of them—a very small area.

Mr. TINCHER. As a matter of fact, if the stock tramps out the grass in one place the grass that comes naturally in its place is just as liable to be better rather than worse than the other grass, is it not?

Mr. JARDINE. No, sir.

Mr. TINCHER. Then why haven't you artificially reseeded that range?

Mr. JARDINE. For the simple reason that thus far the dollars invested in the national ranges can be more profitably used for range improvements other than reseeded. More cattle can be taken care of per dollar invested, and our dollars invested have never met the needs.

Mr. TINCHER. The Government don't own any cattle?

Mr. JARDINE. No, sir.

Mr. TINCHER. Nor sheep?

Mr. JARDINE. No, sir.

Mr. TINCHER. What is the character of the forests; I mean what is the difference between the forests where the sheep are grazed?

Mr. JARDINE. In many forests where sheep are grazed the forests are so dense that you can not ride through them; oftentimes you have to crawl through.

Mr. RUBEY. The grass will not grow very rapidly in places like that.

Mr. JARDINE. The forage ordinarily is weeds and browse that grow in the shade.

Mr. McLAUGHLIN of Michigan. In you experiments what kind of grass seed do you use?

Mr. JARDINE. We have had experiments in the use of timothy, clover, blue grass, Italian rye grass, broom grass, and many others.

Mr. McLAUGHLIN of Michigan. Which does the best?

Mr. JARDINE. Timothy, economically, is the best.

Mr. RUBEY. I was riding on a train through Nevada some time ago and a man took me out on the back vestibule and pointed out and said, "We are passing through a forest reserve." There were no trees in sight, and I thought possibly that was one of the forest reserves over which you were grazing these cattle and sheep.

Mr. JARDINE. I want to explain just a little more about this cattle business. A cattle unit will probably graze 800 to 2,000 cattle. These ranges vary so much in character that every range has its individual problems. We have worked out a number of problems, fundamentally, in a few places. We now have the difficulty of adapting those methods to the different localities, broadly speaking. We have not had the men available to go out and make the individual tests.

The increase in the demand for grazing is very rapid, and we should have at least one man in each of the six western districts.

Mr. TINCHER. Do you think the Government ought to spend any money in investigating the range conditions within the Colorado national forests?

Mr. JARDINE. I certainly think that if the grazing resources are being sold and utilized and the Government is directing the utilization, the Government ought to do it as a matter of economy.

Mr. McLAUGHLIN of Nebraska. In that mountain country, can you successfully reseed with timothy any of this land you speak of?

Mr. JARDINE. We can on small acreage. A dollar spent for that will not bring as much return to the Government in grazing cattle, or as much to the stock industry, as will a dollar spent in some of the other work discussed.

Mr. McLAUGHLIN of Nebraska. The only places you can grow grass would be on river bottoms and areas like that?

Mr. JARDINE. No, sir; it would be in those mountain meadows, little valleys, or narrow strips along the streams.

Mr. TINCHER. Native grass grows on the mountains. What I don't understand about these expenditures is what will the Government derive by spending money in Colorado to investigate these range conditions or reseed any part of the Rocky Mountains. The stockmen there understand the range conditions, don't they?

Mr. JARDINE. The stockmen do not understand all the conditions. The stockmen understand something about reseeding, but they do not understand reseeding or range management problems under all the conditions. The stockmen frequently urge reseeding where it will not be good business to seed.

Mr. TINCHER. What would be the difference of appropriating money for that and appropriating money to go into Iowa or Illinois to educate the stockmen how to handle their stock.

Mr. JARDINE. The Government does not own the lands in Iowa or Illinois, while in Colorado it does. This is only on Government land.

Mr. TINCHER. I understand, but the use the Government is making of this land is for the growing of forests.

Mr. GRAVES. May I state one thing? One of the points that we are most interested in, in the whole situation, is to guard against overstocking these national forests, which were set aside primarily as forests, for the growing of timber and the protecting of the watershed. Forestry and watershed protection are the two great primary purposes of the enabling act of the national forests. Grazing is a secondary use and must be subordinated to the interests of the tree growth. I want to be perfectly certain that the use of these lands in the Rocky Mountains for grazing does not interfere with the growth of the trees. In many places where the old-fashioned grazing was practiced, it not only hurt the forest but it also was the cause of serious erosion. There are a great many meadows in Colorado to-day where you can see the old furrows and the old gullies where erosion had started and which are now being restored under proper regulation of the grazing lands. The protection of these slopes is important; and it can not be accomplished unless the grazing is done right. That seems to me the big thing.

Mr. TINCHER. Your idea, then, is to start regular grazing and cover most of the Federal forests?

Mr. GRAVES. Of course, the administration comes under the other items of the bill, as the salaries of the administrative officers; but technical knowledge forms our basis for good administration.

Mr. TINCHER. What machinery have you for working this out in the forests?

Mr. GRAVES. That is done primarily through the local officers, supervisors, range inspectors, and they rely upon the technical, scientific men to help them on their working out of the plans.

Mr. TINCHER. The Government knows what is grazing land; what regulations there ought to be with reference to grazing, does it not?

Mr. GRAVES. It is a pretty difficult thing to take, say, a thousand men and expect them all to be expert grazing men.

Mr. TINCHER. Suppose I owned this land instead of the Government, and I started out in 1912 to find out about grazing in the forests; I certainly ought to know by this time to what extent they ought to be grazed. Does not the Government know now?

Mr. GRAVES. We know the general plans, but in the application of them—

Mr. TINCHER (interposing). You have a right under the law to regulate that.

Mr. GRAVES. I have in mind a number of forests on which I need to have some grazing experts study the conditions as to whether we can continue to carry the present number of stock without injury. Experts ought to visit and study those forests who have more special knowledge than the local forestry officers have. That is what Mr.

Jardine has in mind when he speaks of the local application of these studies.

Mr. JARDINE. I think the most difficult thing for us to determine is the number of stock each range will support under the management we can expect. This is largely an individual problem for each range and requires study.

Mr. McLAUGHLIN of Michigan. Of course, what you do in Colorado is on the national forests?

Mr. JARDINE. Yes, sir.

Mr. McLAUGHLIN of Michigan. If that benefits the private owners it is because they learn what you are doing and apply it in their work?

Mr. JARDINE. And this is done, as pointed out by Col. Graves, principally to insure the forests not being injured. We must have better handling of stock or make a reduction in numbers. A reduction of 4 per cent in the number of stock grazed, on the basis of the present fees, would amount to over \$100,000 in fees annually, and the reduction of 4 per cent would be very small.

Mr. McLAUGHLIN of Michigan. As a result of your study, your experimentation, and methods of operation, the grazing possibilities of those lands have greatly increased, have they not?

Mr. JARDINE. Yes, sir.

Mr. McLAUGHLIN of Michigan. So that there are many more stock in better shape than on the private lands?

Mr. JARDINE. We have increased approximately 45 per cent since 1907. Of this we estimate that one-third is due to better handling of stock and about 50 per cent to better management of the grazing, giving vegetation a chance to grow, and making the best use of it. The remainder is due to the opening up of areas which prior to 1907 were not in use.

Mr. McLAUGHLIN of Michigan. As a result of your work, the national grazing areas are better for stock than the lands that are owned by private parties?

Mr. JARDINE. In many cases, yes, sir; in some cases, I do not believe that is true because some men have protected their own lands by using the outside public domain.

Mr. McLAUGHLIN of Michigan. As a general proposition, the grazing on the national forest reserves is worth more than the grazing on private lands, and I think we charge only one-half what is charged by private owners.

Mr. JARDINE. I wouldn't say that it is worth more as grazing land than the private lands. I have been a stockman, and I should say that I would take the private lands.

Mr. McLAUGHLIN of Michigan. Why?

Mr. JARDINE. Necessarily there are restrictions as to grazing on the national forests. We have to protect the forests, the watersheds, the game resources, and provide for recreational use of the national forests; we have more restrictions as to seasons of grazing and the handling of the stock on the range; the Government lands are rough and unfenced, making it difficult to prevent losses.

Mr. McLAUGHLIN of Michigan. But you are carrying on this work for the purpose of protecting vegetation, increasing the quantity of it?

Mr. JARDINE. Yes, sir.

Mr. McLAUGHLIN of Michigan. You are improving this grazing; it is better for the animals that are put on the land?

Mr. JARDINE. Yes, sir.

Mr. McLAUGHLIN of Michigan. And the grass is improving?

Mr. JARDINE. Yes, sir; I think so.

Mr. McLAUGHLIN of Michigan. Unless your work has been helpful along those lines some one might be harsh enough to say that the money had been wasted.

Mr. JARDINE. The money has not been wasted. Many private owners have adopted our methods. Some of the biggest live-stock growers in Nevada have employed our experts and adapted our methods, both in the management of stock and in the survey and classification of the areas.

Mr. McLAUGHLIN of Michigan. You say there are restrictions as to the use of the grazing lands owned by the Government that reduce the value for grazing purposes. There are restrictions as to the number of animals that will be permitted to graze on a given area, and there are other restrictions that you think would lessen the desirability of grazing on the Federal lands.

Mr. GRAVES. There are certain restrictions.

Mr. McLAUGHLIN of Michigan. Tell us something about those restrictions.

Mr. GRAVES. The restrictions provide that there may be certain reductions made, down to a certain limit, in order to provide for the new applicants, and particularly the small owners.

Mr. McLAUGHLIN of Michigan. What do you mean by certain limits? What are certain limits?

Mr. GRAVES. Reductions may be made at any time where it is found that the stock are injuring the forest lands.

Mr. McLAUGHLIN of Michigan. Reducing the time of grazing or the numbers of stock?

Mr. GRAVES. Reducing the number of stock for which they have been granted a permit.

Mr. TINCHER. How many acres are allowed in Colorado to each head of stock?

Mr. JARDINE. It varies. All the way from about 2 acres a head per month for cattle to probably as much as 10 acres.

Mr. TINCHER. You evidently know how many it takes in Colorado?

Mr. JARDINE. We can not know a quarter of a mile in advance what the type of grazing will be without examination.

Mr. TINCHER. Has the income from the forest reserves on account of grazing increased 45 per cent during the last few years?

Mr. JARDINE. We have increased the number of stock on a given acreage 45 per cent since 1907.

Mr. TINCHER. That increases the income 45 per cent?

Mr. JARDINE. The fees have been advanced.

Mr. TINCHER. How much has the increase been to the Government; to what extent has the Government income from the use of the forest reserves been increased, say, during the last four years; what percentage?

Mr. McLAUGHLIN of Michigan. Perhaps it would be better to put the figures into the record. I would like to follow the matter up. The

committee has been severely attacked, and the policies of the department have been severely attacked, on the floor of the House, because the charge made by the Federal Government for the use of grazing land is only about one-half the charge made by States and by private interests. We wish to be able to answer that criticism if we can. You say it is due to restrictions placed upon the use of the lands; that the Government places restrictions upon the use of these grazing lands that are not imposed upon those who use other lands. I wish you would give us that in detail so that we can understand it thoroughly. Just to say that there are certain restrictions, or certain limitations, does not answer the question at all. Will you please give us that information in detail so as to enable us to answer anyone who may make inquiries.

**STATEMENT OF MR. E. A. SHERMAN, ASSISTANT FORESTER,
FOREST SERVICE, DEPARTMENT OF AGRICULTURE.**

MR. SHERMAN. In the first place, the permits are subject to any reduction which may be necessary in order to stop damage, either to the forage, to the forests, or to the watershed. A reduction of 50 per cent may be necessary, or the stock may be thrown off of the lands entirely, in order to protect the range and the watershed.

MR. McLAUGHLIN of Michigan. Has that been found necessary, and has that restriction been applied in such a way or to such an extent that those who use the land go to you and demand a reduction on that account?

MR. SHERMAN. That has been necessary in some cases. In addition to that, each permittee owning stock not in excess of the protective limit and that is usually a very small number—20 head of cattle or a thousand head of sheep) is subject to a reduction of not exceeding 20 per cent in order to permit small owners or new settlers to have grazing lands. In addition to that, the range upon which the permittee runs his stock being on public lands is subject to acquisition under certain conditions, in accordance with the land laws, and are subject to acquisition at any time under the mineral laws. Very frequently lands which are very desirable for an individual's allotment may be located as mineral claims and the most available water to the range controlled, the stock kept off, and the man's plans for the management and handling of his stock interfered with.

MR. McLAUGHLIN of Michigan. At any time a mineral discovery is made the prospector can locate on the land and take jurisdiction, and his jurisdiction is absolute?

MR. SHERMAN. Yes, sir.

MR. McLAUGHLIN of Michigan. Has that happened so often that it is a reason for those who would use the lands to demand a reduction?

MR. SHERMAN. That is one of the elements of uncertainty that the permittee encounters.

THE CHAIRMAN. How large a claim may the prospectors take up?

MR. SHERMAN. The miner and seven associates can locate 160 acres, that is, eight claims of 20 acres each. He can locate them in most

any form. He can locate the 20 acres so as to control the watering places and the most desirable grazing land.

Mr. McLAUGHLIN of Michigan. Can you tell us in how many cases men's leases have been interfered with by the locating of mining claims?

Mr. SHERMAN. I would be unable to say.

Mr. McLAUGHLIN of Michigan. Do you know of any?

Mr. SHERMAN. I do not recall any. Several years ago, when I was district forester at Ogden, one of the most important grazing districts in the Humboldt Forest was interfered with in that way, by a miner taking up a string of claims along a creek.

Mr. McLAUGHLIN of Michigan. Do you know of any other case since that time?

Mr. SHERMAN. In that case the permittee had to go in and pay the miner a good round sum in order to be allowed to water his stock.

Mr. McLAUGHLIN of Michigan. What year was that?

Mr. SHERMAN. That was in 1913 or 1914.

Mr. McLAUGHLIN of Michigan. Do you recall any similar cases where a man's leases have been interfered with; or do you know of any other cases where they are liable to be interfered with?

Mr. SHERMAN. I don't recall any other cases. I think there have been many such cases.

Mr. McLAUGHLIN of Michigan. What other restrictions are there which will interfere with or reduce the value of forest range land that might not apply to private lands?

Mr. SHERMAN. Another point is the fact that the permit is an annual permit and is not given for a definite length of time. On some forests permits are given for five years, subject to these reductions I speak of; but this is simply an annual permit.

Mr. McLAUGHLIN of Michigan. What is the custom in leasing private lands?

Mr. SHERMAN. The custom in leasing private lands, of course, is that it is absolute for one year, or ten years, or whatever definite period of time the lease may run.

Mr. McLAUGHLIN of Michigan. You say that some of the leases are given for one year, and that on some reservations you give leases for five years. Is there very much difference, then, between your method of leasing (as to time, I mean) and the method of the private owners?

Mr. GRAVES. The stockmen claim there is.

Mr. McLAUGHLIN of Michigan. Will you state, if you know, what the difference is between the grazing fee charged by the Federal Government and the grazing fee charged by others?

Mr. SHERMAN. The statement already made that private owners charge double the amount that the Government charges is, I believe, approximately correct.

Mr. McLAUGHLIN of Michigan. The Government gets approximately one-half as much as the others charge?

Mr. GRAVES. When this study was made, about three years ago, Mr. McLaughlin, and the present standard determined upon, the fees we are getting now were about two-thirds of the average fee for similar lands privately owned. This extra third represents the dif-

ference in desirability of the public lands as compared with the private lands.

The CHAIRMAN. I believe you stated that there was a small amount of land owned by private owners, or States, which come in competition with this grazing land on the forest reserves?

Mr. GRAVES. There are not very many large compact tracts of such land immediately adjacent in the national forests. There are small tracts, sections here and there.

The CHAIRMAN. It is hardly worth while to consider how much the fee is on the small amount of land owned by the private parties, is it?

Mr. GRAVES. It is only within the last few years that some of that land has been leased.

The CHAIRMAN. Those are small tracts, and afford no basis of comparison with the forest lands?

Mr. GRAVES. There is nothing to compare on as large a scale.

The CHAIRMAN. Are they fenced?

Mr. GRAVES. No.

Mr. McLAUGHLIN of Michigan. Are the large tracts that are owned by States leased by the States?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. As to those lands which are owned by the State, are they subject to purchase from the States?

Mr. GRAVES. The States sell them; yes, sir.

Mr. McLAUGHLIN of Michigan. In case the State sold the land, the lease would have to be terminated the same as a lease with the Government would have to be terminated?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. So that the handicap is the same with regard to the State lands as with the Federal lands; is that true?

Mr. GRAVES. I think the difference would be that, where anyone leases from the State, as I understand the matter, they are practically without any limitation as to the number of stock or anything else.

Mr. McLAUGHLIN of Michigan. As to the acquisition of land from the State by anyone who wishes to purchase it, are the States authorized to sell?

Mr. GRAVES. Yes, sir; a State may sell its land.

Mr. McLAUGHLIN of Michigan. So that the lease that a State makes is subject to the same restrictions as that which you make?

Mr. SHERMAN. The leases are not subject to the same restrictions. In the first place, the State lands are not subject to the operation of the mining laws, and the State does not sell during the period for which the lease is effective. Usually, also, when the States does sell, the sale is made at public auction of some sort to the highest bidder, so that the person who leases, if he wishes, can protect himself by buying the land. The State leases ordinarily are not subject to restrictions as to seasons of grazing, numbers of stock, or the way the stock is handled. The lessee may also fence at will to exclude other stock or to facilitate the handling of his own stock.

Mr. McLAUGHLIN of Michigan. If a State makes a lease of grazing lands for 10 years, do you mean to say that during that time a mining claim can not be located on the State lands?

Mr. SHERMAN. A mining claim can not under any condition be located on State land; it is not subject to the mining laws.

Mr. McLAUGHLIN of Michigan. It is not subject to the mining laws of the State?

Mr. SHERMAN. The State makes no provision—or, at least, none of the Western States make any provision—for any of their land being subject to prospecting entries. They only lease and sell.

Mr. McLAUGHLIN of Michigan. Then, during the 10 years, if mineral should be discovered on land leased for grazing, the State can not sell it, no matter what price may be offered for it?

Mr. SHERMAN. I would not say that. They probably have some provision for disposing of the lands under lease under extraordinary conditions of that sort, if the situation justifies it.

The CHAIRMAN. The opening up of tracts of 160 acres would not interfere with the large reserve of a million acres, would it?

Mr. SHERMAN. It would not interfere with the large reserve, but it might very seriously interfere with the use of the range within a certain stockman's allotments.

The CHAIRMAN. By the use of the water particularly?

Mr. SHERMAN. By controlling access to the water.

Mr. HUTCHINSON. Does the State spend any money in the way of keeping up these operations?

Mr. SHERMAN. I am not aware of any State that does.

Mr. HUTCHINSON. The Government does?

Mr. SHERMAN. The Government does that in a small way—in an experimental way.

Mr. HUTCHINSON. The State spends no money; it just lays the ground and lets it go?

Mr. SHERMAN. The State, of course, carries on its experimental work in connection with the experimental stations.

Mr. McLAUGHLIN of Michigan. For my part, I am very much obliged to this gentleman for making this explanation. It will enable us to see what has been done heretofore.

The CHAIRMAN. Thank you, Mr. Sherman.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Mr. RUBEY. You have a pamphlet which you issue in the West, giving full information as to grazing inspections and all that sort of thing?

Mr. GRAVES. Yes.

Mr. RUBEY. Can you furnish the members of the committee with a copy?

Mr. GRAVES. I would be glad to.

Mr. RUBEY. I would like to have a copy of it.

The CHAIRMAN. Will you give us the character of the leases, with details as to the number of permits?

Mr. GRAVES. I can very easily insert that information in the record.

The CHAIRMAN. Will you state briefly, if you have the table before you, the number of leases for which permits have been granted?

Mr. GRAVES. I have not that matter here, but I can very easily furnish it to you.

The CHAIRMAN. I do not want the form, but merely a brief statement of the number of permits, the number of stock, etc.

Mr. GRAVES. You mean that is allowed by the individual?

The CHAIRMAN. Yes.

Mr. GRAVES. It is a very simple form, which gives him permission to use it.

The CHAIRMAN. I am not interested in that; I mean the number of cattle that may be grazed under a certain permit, the average number, and the largest number that can be grazed.

Mr. GRAVES. I think that would be shown in the matter that Mr. McLaughlin asked yesterday to be inserted in the record.

Mr. McLAUGHLIN of Michigan. Yes.

The CHAIRMAN. That should be in the record. You did not state the number of leases or permits.

Mr. GRAVES. No; I was going to insert that in the portion of yesterday's hearings among the material that Mr. McLaughlin asked for.

Mr. McLAUGHLIN of Michigan. In that connection, bear in mind I would like to have information as to the privileges settlers and individuals in those localities have of grazing for their own use and without charge, and so on.

Mr. GRAVES. I will note that down to be inserted together with the other material.

Mr. McLAUGHLIN of Michigan. In all cases, a man located out there is preferred in the matter of the leasing of the land, is he not?

Mr. GRAVES. He is given the preference. This information will be included with the data asked for yesterday.

STATEMENT OF MR. JAMES T. JARDINE, INSPECTOR OF GRAZING, FOREST SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Mr. TINCHER. Mr. Jardine has the figures on grazing that I was anxious to have in the hearings, and I would like to have them put in the record at this time. You have handed me some figures for grazing fees. They show receipts for the fiscal year 1914 of \$1,002,348.

Mr. JARDINE. Yes, sir.

Mr. TINCHER. And grazing fees for this fiscal year amounted to \$2,609,169.

Mr. JARDINE. Yes, sir.

Mr. TINCHER. An increase of 160 per cent?

Mr. JARDINE. Yes, sir.

Mr. TINCHER. Cattle and horses grazed in 1914, 1,620,261 head; sheep and goats, 7,618,802.

Mr. JARDINE. Yes, sir.

Mr. TINCHER. Cattle and horses grazed in 1919, 2,233,932; sheep and goats, 7,995,963.

Mr. JARDINE. Yes, sir.

Mr. TINCHER. The increase from 1914 has been in the number of cattle and horses grazed.

Mr. JARDINE. Yes, sir. There has been some increase in sheep and goats also.

Mr. TINCHER. A slight increase, but the main increase is in cattle and horses. The increased income to the Government has been 160 per cent.

Mr. JARDINE. Yes, sir; 160 per cent.

Mr. TINCHER. That is in the face of the fact that the increased cost to the owner of the live stock of this character for grazing in the grazing season, where they are not grazed upon Government lands, has been nearly 300 per cent in the same length of time.

Mr. JARDINE. A cost to him of doing that?

Mr. TINCHER. For grazing. For instance, the man who owns live stock has to have them grazed and does not have the benefit of a Government reservation for that purpose. How much increase would that be? It costs three times as much to graze now as it did in 1914?

Mr. JARDINE. That is not true where they have the pasture lands for part of the season.

Mr. TINCHER. That would be true if they rent the pasture lands or hire the grazing. You will find that is the experience of every man engaged in the live-stock business. They will tell you that there is a 300 per cent increase.

Mr. JARDINE. It is not 300 per cent for the grazing land. This increase given for the national forests, of course, does not include the cost of operating, the cost of handling, or the cost of range and feed for the seven to nine months the stock are not on the forest range.

Mr. TINCHER. What I mean is this, that where an individual is getting an animal pastured for \$5 for seven months in 1914, he pays \$14 in 1919. That has been the increase outside of Government operations.

The CHAIRMAN. In other words, outside of the reservation they pay \$14, and on the reservation they pay 72 cents.

Mr. TINCHER. I do not know what the figure is on the reservation.

The CHAIRMAN. That was the average last year.

Mr. TINCHER. My idea was not to have the record disclose that by spending a little money we had increased the income when, as a matter of fact, a man would be driven to the Government reservation by the increased cost of pasturing his live stock. There would be no reason why the Government should not raise the price of grazing on the reservation.

Mr. HUTCHINSON. I understood you to say that the increase in cattle is about 37 per cent.

Mr. JARDINE. Yes, sir; approximately 37 per cent since 1914.

Mr. HUTCHINSON. Have you ever given any thought to the reason for the constant increase in the price of meat?

Mr. ANDERSON. He refers to the cattle on the national forest range and the increase of cattle there.

Mr. JARDINE. That is, cattle on the national forest range.

Mr. ANDERSON. There is an increase of cattle there. Could you give us any reason why the price of meat is going up? I thought maybe it was going into storage.

The CHAIRMAN. If the fees were fixed at the State's present charge, you would have no trouble in leasing all that land, would you?

Mr. GRAVES. It would be quite possible to put the forest lands under competition and lease them to the highest bidder.

The CHAIRMAN. The charge could be adjusted by arbitrarily fixing your table of fees at three times the present rate, which would

be, in my opinion, a very reasonable charge compared with what others pay.

Mr. GRAVES. I question whether it would be a desirable thing from the standpoint of a large number of small settlers who constitute the greatest number of our permittees.

The CHAIRMAN. We might exempt the settlers if we are going to run a charitable institution; but I am not so sure that the forests should be made into a charitable institution.

Mr. GRAVES. There are, of course, a great many things which are now being done along that line in the matter of the free use of the timber, free use of the grazing privileges for a certain number of stock, and so on. I think it has always been the attitude of Congress to give special assistance to settlers.

The CHAIRMAN. But the settlers are few; I take it, the permits granted to settlers are very small in number as compared with the permits of stockmen and speculators?

Mr. GRAVES. The number of permits given to the small men who are local settlers is very large. I have not at hand what that proportion is, but it can be inserted. It is a very large proportion.

The CHAIRMAN. Does not that table show it?

Mr. McLAUGHLIN of Michigan. The aggregate of acreage let to these small owners is small compared to the total acreage you let to all others?

Mr. GRAVES. No, sir. A large proportion of the permittees are small owners.

Mr. McLAUGHLIN of Michigan. That is, as to the number of permits?

Mr. GRAVES. And the number of head of cattle.

The CHAIRMAN. What is the average herd of the settler?

Mr. GRAVES. Do you recall that, Mr. Jardine?

Mr. JARDINE. It varies. The average cattle permit for the total of 2,500,000 head was 68 head the last fiscal year.

The CHAIRMAN. The average?

Mr. JARDINE. The average for all permits. In local communities—for instance, in a number of forests in Utah—the protective limit is less than 25 head. The average permit for cattle on the Manti National Forest is, as I understand it, something under 15 head.

The CHAIRMAN. What do the settlers do aside from cattle business—cultivate the lands and grow crops?

Mr. JARDINE. They cultivate the land, and in many cases this few head of stock constitute their cash crop.

Mr. ANDERSON. Do you mean homesteaders when you say settlers?

Mr. JARDINE. Ordinarily, no. A good many of them have lands which produce some feed, part of it irrigated; a part of it is used for growing cereals—wheat or barley or oats—and probably a little alfalfa, and they use the by-products.

Mr. ANDERSON. They have a permanent title to the lands?

Mr. JARDINE. Yes, sir.

Mr. ANDERSON. How do they get it; by homesteading?

Mr. JARDINE. By homesteading originally or by purchase.

The CHAIRMAN. How can it be purchased; from those who buy it from the Government?

Mr. GRAVES. They buy it from individuals.

The CHAIRMAN. How did those individuals get it?

Mr. JARDINE. They originally homesteaded.

The CHAIRMAN. Under the 640-acre law?

Mr. JARDINE. No, sir.

The CHAIRMAN. The 160?

Mr. JARDINE. Some 320; ordinarily 160.

The CHAIRMAN. To what extent are the lands cultivated by the settlers?

Mr. JARDINE. A majority of them have a considerable acreage cultivated. In some cases only small areas are cultivated.

The CHAIRMAN. Generally speaking?

Mr. JARDINE. Generally speaking, the lands that are used as a basis for stock-grazing permits are cultivated extensively.

The CHAIRMAN. Do they grow wheat and oats, or is it just a gardening proposition?

Mr. JARDINE. They grow wheat, oats, and hay in some sections.

The CHAIRMAN. To what extent on the 160 acres?

Mr. JARDINE. In many cases on the entire 160 acres.

The CHAIRMAN. They would not cultivate 160 acres for the family's consumption?

Mr. JARDINE. No; but where we now have very small ownership of stock the average land holding is, I should say, 40 acres or less.

Mr. TINCHER. Here is the point I am trying to get at: In 1919 the Government grazed for private owners 2,233,932 horses and cattle. Any individual who had cattle grazed in 1919 by anyone but the Government paid an advance of at least \$5 over 1914. I want to make this suggestion, that an increase of \$2 a head on those cattle for 1919 by the Government would have increased your income over \$4,000,000. Why should we present that to any class of people? Other people are paying for it; the men who are paying \$5 a head increase for their cattle at other places are helping to pay taxes to maintain this appropriation. Why should this money practically be given to the people who graze these cattle?

Mr. JARDINE. There is just one point I would like to make clear in this: If there is an increase of \$5 a head, you must keep in mind the season. Much of the grazing on the national forests is for a short season—100 days.

The CHAIRMAN. But you charge in proportion to the operating days—one-tenth for each month? How much are cattle on that basis?

Mr. JARDINE. For cattle, \$1.50 a head, for year-long grazing.

The CHAIRMAN. That would make it one-tenth of \$1.50?

Mr. JARDINE. Yes, sir; or one-ninth per month for periods less than 4 months.

Mr. TINCHER. The matter I was talking about was on a basis of increase of \$5 to \$9, based on seven months' pasture season.

Mr. JARDINE. Yes, sir.

Mr. TINCHER. That is where a great proportion of the meat of this country is produced. They have paid that increase for taxes.

The CHAIRMAN. Thank you, Mr. Jardine. Will you proceed, Col. Graves?

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF
OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE—
Continued.

Mr. GRAVES. Should you not also consider in connection with this whole problem the fact that there are about 200,000,000 acres of open public range lands in the West which are still being grazed absolutely free?

Mr. McLAUGHLIN of Michigan. Are those lands under the charge of the Interior Department?

Mr. GRAVES. Yes, sir.

The CHAIRMAN. That is a matter of policy?

Mr. GRAVES. That is what I meant. It was a matter of wise public policy to regulate the grazing on the national forests. In considering the charges for the privileges and their industrial effect, we have also to consider the very large area which has not yet been placed under any administration at all.

The CHAIRMAN. No fault is found at what is being done; it is just a question of policy.

Mr. GRAVES. Yes.

The CHAIRMAN. If the committee should decide upon a different policy that would be a different thing.

Mr. GRAVES. Yes; I should think in connection with that that it would be well to bear in mind the situation regarding the small men and I can place in your hands the exact data about that so you can have that before you in considering the matter.

The CHAIRMAN. That is what the committee would like. The committee will then discuss the policy.

Mr. McLAUGHLIN of Michigan. There is one thing confronting us; that is, you practically make it impossible for us to increase these rates now, in that the Secretary of Agriculture at a meeting of the stockmen assured them that there would be no increase of rates during the next five years.

Mr. GRAVES. That was a statement of policy, that we did not contemplate making a change. It would not embarrass the Congress in any way in laying down any different policy.

The CHAIRMAN. As I understand, there was no explicit agreement?

Mr. GRAVES. It is a statement of policy, made also to our permittees.

Mr. McLAUGHLIN of Michigan. How was it given? Did I misunderstand you? Was the Secretary attending a meeting of stockmen interested in this grazing and gave them that assurance?

Mr. GRAVES. I do not recall the particular circumstance of the livestock meeting. The Secretary made public a statement of our general policy of five-year readjustments, designed to settle this grazing question, the question of the fees, which has been a matter of very great controversy.

Mr. McLAUGHLIN of Michigan. When was that statement issued; by whom, to whom, and under what circumstances?

Mr. GRAVES. I will have to look that up.

The CHAIRMAN. Was that for the duration of the war or does it establish a policy?

Mr. GRAVES. That was in the line of settling the whole disputed question of the fees, with the idea of having a readjustment period—

ically rather than to have an increase every year or every two years. Based on the conditions prevailing when the present basis of charge was determined upon, the fee is, in my opinion, right. The war has caused new conditions that may require further readjustment. I think it would be a very appropriate thing for the committee to examine the present policy and determine whether it wishes to approve that or would wish to have the full commercial value of the privileges determined, perhaps, every year or so, to respond to such increases of private values as have occurred in the past two years.

Mr. McLAUGHLIN of Michigan. In considering whether or not the policy should be changed, it would be interesting for us to know what assurances, if we can call them assurances, or promises, were given by the Secretary of Agriculture in regard to the rates, and how long they should continue at the present level.

Mr. GRAVES. I do not think there were any assurances of any such formality that would be in any way embarrassing to this committee. I will include the Secretary's letter in the record at this point.

(The letter referred to follows:)

WASHINGTON, D. C., November 23, 1918.

Mr. T. W. TOMLINSON,

Secretary American National Live Stock Association, Denver, Colo.

DEAR SIR: Careful consideration has been given to the question of the rates which will be charged for grazing upon the national forests during the coming season, including further information which has been gained regarding the relative values of grazing in different localities and the statements which have been presented by representative stockmen. In accordance with the conclusion announced by me on February 1, 1917, that the charge for grazing should be based upon the real value of the forage, I have decided that beginning March 1, 1919, the charge for grazing upon the national forests during the year-long period will be from 80 cents to \$1.50 per head for cattle, varying with the advantages of the different ranges. The rate for sheep and goats on each forest will be 25 per cent of the rate for cattle. The rate for horses will be 25 per cent more than for cattle, and the rate for swine 25 per cent less. The proportionate charge for grazing during only a part of each year will be in accordance with the provisions of the national forest regulations.

You are aware of the fact that I suspended action in this matter last year on account of the greatly disturbed conditions and the unusual problems which confronted the stockmen at that time. I am not unmindful of the difficulties which still exist, but under the circumstances it seems unwise to further defer action on this important problem.

From time to time the stockmen have urged that as a means of stabilizing the live-stock industry grazing permits be issued for periods of 5 or 10 years not subject to reduction except for violation of their terms or to stop damage to the forest or range. On several of the forests applications have already been approved for permits during a five-year period subject to an annual reduction of five per cent to provide for the issuance of permits to new settlers, in addition to such reduction as might be necessary to prevent damage to the forest.

It appears that while the stockmen are ready to subject themselves to whatever restrictions are necessary for the welfare of the forest from the standpoint of timber production or other primary purposes for which the land was set aside, yet the possibility of the five per cent annual reduction proves an embarrassment to them. It is appreciated that the assurance of continued use of the range for a specific number of animals during a term of years would undoubtedly tend to greater stability of the industry and encourage the handling of business in a way to increase the quantity and improve the quality of the live stock and would also enable a better administration of the range itself.

On a considerable portion of the national forests we have reached the point where permits for a period of five years can be put into effect without difficulty. On certain other forests we are not in a position to grant five-year permits for more than a portion of the stock at present upon them, because there is serious question whether there is not now more stock than can be carried permanently without injury to the forest. There is also the extra stock which has been

taken care of as a war emergency some of which we will not be able to continue, and for that reason should not be included under five-year permits.

Therefore, I am authorizing the forester to issue five-year grazing permits beginning with the season of 1919 where the conditions warrant such action and it is desired by the permittees. The issuance of annual permits will be continued where reductions are necessary to insure against overstocking or where this may be required for any other reason. The plan is progressively to bring about a more secure tenure of the grazing privileges through the issuance of five-year permits as fast as this can be done in consideration of the various public interests involved.

Very truly, yours,

D. F. HOUSTON, *Secretary.*

Mr. GRAVES. The Secretary's letter deals with grazing fees only in its first two paragraphs. The four following paragraphs deal with the extension of the policy of five-year permits. This letter makes no promise regarding the possible change of fees. The Forest Service has, however, indicated to the stockmen that the policy would be to recommend material changes in the grazing fees only at five-year periods and has based its five-year permits on that policy. Unless such a policy is adopted the five-year permit would be little more valuable than an annual permit, since it would be subject to radical increase in charges at any time, which charges might entirely upset the stockman's plans. At the time the present fees were fixed by the Secretary of Agriculture the rates fairly represented the value of the grazing privileges as compared with charges received for use of private land. However, since then prices have advanced exorbitantly. A number of our most important national forest States have been seriously stricken by drouth. The stockmen would be compelled to pay most anything we want to ask and would do so in preference to sacrificing their immature stock. The Forest Service has not felt inclined to take advantage of this situation. However, should such high rates become established as normal rather than abnormal, the Forest Service would feel justified in accepting them as such and in making the proper relative advance in grazing fees at the next readjustment.

The CHAIRMAN. Of course, nobody wants to repudiate a contract. If a contract was made, that should stand. But, as you recall, when we started on this forest proposition, it was generally understood and the people were led to believe, that it would be made self-sustaining within a very short time.

There is a shortage of probably \$3,000,000. It may be necessary to change the policy in order to bring about the results desired and anticipated at the time we embarked upon this proposition. This seems to be about the only way at the present time to accomplish what was promised to the people at that time.

Mr. GRAVES. Of course, there are a great many privileges in the national forest which are quite free, especially to settlers, for which we do not make any charges.

I think it is very appropriate for the committee at the present time to consider also the whole question of grazing on the open public domain, much of which is adjacent to the national forests. There are some 200,000,000 acres of open public domain which is not under any regulation, upon which stock is grazed without any control, and on a very large part of which there has been so much overgrazing that the carrying capacity for stock has been reduced to fully one-half of the normal. In many places the overgrazing has al-

ready resulted in erosion, which is seriously jeopardizing the stability of the water resources. The proposal to put these lands under some sort of administration and control, similar to that which is exercised in grazing in the national forest, has been made repeatedly for the last 10 or 12 years. There have been bills in Congress in regard to it, and I believe there is enough public sentiment in the West to-day to support some sort of governmental regulation of these lands, with the provision, of course, always for the proper classification and opening up of lands suited to homesteading and other home developments.

Mr. JACOWAY. How long has this policy been in force in the national forests?

Mr. GRAVES. Since 1905; but the public domain has never been placed under administration.

Mr. ANDERSON. I understand there was a practical agreement for leasing legislation last year. I do not remember what became of it, but I know that some gentlemen who were very much interested in it undertook to secure some sort of arrangement with the Public Lands Committee for reporting out that sort of legislation, but nothing apparently ever came of it.

Mr. RUBEY. It seems to me we have had some bills pending in relation to that very subject.

Mr. ANDERSON. I am sure of it.

Mr. McLAUGHLIN of Michigan. Does the Interior Department object to it?

Mr. GRAVES. I do not know that they do now.

Mr. RUBEY. Is it not a fact that objections come from western men who use and have had the benefit of these ranges free for all these years? Are not they the fellows who object?

The CHAIRMAN. Where are these lands located?

Mr. GRAVES. There are a great many of them in the Southwest, Arizona and in New Mexico, and practically all the other Western States. There are some in eastern Oregon and Washington—

Mr. JARDINE. Yes; the largest areas are in Nevada, Arizona, and New Mexico. There are areas in California and Oregon, a small area in Washington, a considerable area in Idaho, and in Wyoming, Colorado, Montana, and Utah.

Mr. McLAUGHLIN of Michigan. Generally speaking, would they compare favorably with your grazing lands for grazing purposes?

Mr. JARDINE. Generally speaking, in grazing capacity they would compare favorably. The problem of the administration is considerably different. They are more plains lands. Many of them are without water. That is one of the difficulties to-day. They are not under administration, and no one is putting in the expensive water development necessary to properly open them up and use them. It is generally estimated that they are not producing over 50 per cent of what they might produce. It would cost considerable to put them in proper shape, but nothing to compare with their value, either for rental or livestock production.

Mr. McLAUGHLIN of Michigan. Are they large tracts?

Mr. JARDINE. Yes, sir; generally they are.

Mr. McLAUGHLIN of Michigan. And they compare favorably with yours?

Mr. JARDINE. In grazing capacity. However, they are suitable mainly for spring, fall, and winter range, while the national forests are primarily summer range.

Mr. McLAUGHLIN of Michigan. Are they in proximity to yours?

Mr. JARDINE. The areas adjoining parts of the national forest areas are becoming less and less. Homesteading is crowding back to the foothills, so that in many cases there is a narrow strip of public domain between the forest and the lower lands. In other cases there are millions of acres that are practically desert at a considerable distance from the forests.

The CHAIRMAN. As a matter of economy, they should be brought under your jurisdiction, should they not? They could be handled by you with a great deal less expense than they could under another department?

Mr. GRAVES. Yes; because the Department of Agriculture has all the trained men that there are in the Government service, skilled in grazing.

The CHAIRMAN. At least, it ought to be in cooperation with the other departments?

Mr. GRAVES. I should think that it ought to be under the Agricultural Department.

The CHAIRMAN. That would be more economical?

Mr. GRAVES. Not only as far as service is concerned, but because that is the logical thing.

Mr. TINCHER. We still maintain Government land offices in these sections where they have these lands; for instance, in Colorado and the other places you named. The only question would be whether they could rent those lands through those land offices with less administrative expense to the Government than through your office.

Mr. GRAVES. Yes, sir.

Mr. TINCHER. At any rate, it should be one or the other. They ought to be leased by one of the departments.

Mr. GRAVES. Yes; I think the matter of working out administrative machinery in handling them is the easiest question.

Mr. TINCHER. One member of the committee suggests that the little fellow out there was using these Government lands. That was not my understanding. Who are using the Government lands?

Mr. GRAVES. You mean the national forest lands?

Mr. TINCHER. No; the other.

Mr. JACOWAY. He means the national forest lands.

Mr. GRAVES. You are referring to the open public lands?

Mr. JARDINE. They are more the large men when we consider the area as a whole. However, there are some places where settlers use the adjoining public lands for grazing their stock. It depends upon the stage of settlement and cost of development. Many of these lands can not be used by other than a large organization. Either the Government would have to develop them and have them handled as large units by cooperative associations or groups of little fellows, or it would take a large private operator to develop and manage them.

Mr. JACOWAY. Didn't you state a while ago that thousands of little fellows, the settlers, would get the advantage under this policy of the Government?

Mr. GRAVES. That is in the national forest.

Mr. TINCHER. No; I mean the other. Tell me what the situation is. Let us say that a big company owns a pasture and in that pasture are several tracts of Government lands. The effect of giving them the use of that Government land is to discourage the system of putting that land off the tax rolls.

Mr. JARDINE. It is illegal to fence the Government land without permit.

Mr. TINCHER. But they have their fences and roads.

The CHAIRMAN. What are the laws in the States with respect to fencing? Are cattle permitted to run at large?

Mr. JARDINE. Ordinarily there are fencing laws in the Western States which require fencing of individual holdings.

Mr. McLAUGHLIN of Michigan. Mr. Jardine spoke about placing large sums of money for developing water purposes. Are you using some of that money for that purpose?

Mr. GRAVES. We are making water improvements at various places.

Mr. McLAUGHLIN of Michigan. Where you have large areas available for grazing, there is always water available somewhere in the vicinity. Do you do anything there with the water supply?

Mr. GRAVES. There are places where we are making some experiments to open up lands that have not been used at all. There is one such place in California.

Mr. McLAUGHLIN of Michigan. On those areas there must be some water.

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. And that supply is under your care?

Mr. GRAVES. Usually.

Mr. McLAUGHLIN of Michigan. Where it is, are you spending money to protect that water supply or improve it and develop it; I mean so as to increase the supply of it to cattle or sheep or goats?

Mr. GRAVES. There are places where there is public water used by quite a number of different permittees.

Mr. JARDINE. In the national forests a great deal of improvement work is done in cooperation with permittees.

Mr. McLAUGHLIN of Michigan. Have you any idea of how much money you are spending for each one of the items?

Mr. GRAVES. This money is derived from the general improvement fund. That comes under another item and will be presented later.

The CHAIRMAN. We will take up the next item, Mr. Graves, No. 246, on page 133:

For the purchase of tree seed, cones, and nursery stock, for seeding and tree planting within national forests.

Mr. GRAVES. There is no change in that.

Mr. ANDERSON. We have been thinking about reducing that a little.

Mr. GRAVES. That was reduced several years ago.

The CHAIRMAN. What is being done with that money?

Mr. GRAVES. That is the item for planting on the national forests. In a number of forests we conduct nurseries, furnishing stock for planting on the more important areas, like watersheds. We are

planting also on lands which have been severely burned over and on which we feel that we are secure from fire.

The CHAIRMAN. Do you plant trees?

Mr. GRAVES. Yes, sir.

The CHAIRMAN. And raise the nursery stock?

Mr. GRAVES. We raise nursery stock. We collect and grade the seed and raise the small trees and set them out in the forest.

The CHAIRMAN. Is that experimental work?

Mr. GRAVES. It is partly experimental. Much of it is beyond the experimental stage. We plant forests in places where we can not expect to get natural production. We plant about 7,000 acres a year now. The work is of increasing importance.

The CHAIRMAN. By planting trees?

Mr. GRAVES. Yes, sir. In Nebraska we are practically creating forests.

Mr. McLAUGHLIN of Nebraska. What particular part of Nebraska?

Mr. GRAVES. In the sandhills of western Nebraska we are planting about a section a year.

Mr. RUBEY. Do you find them the next year when you go back to look for them?

Mr. GRAVES. The plantations have been singularly successful.

The CHAIRMAN. Describe the planting; how is it done?

Mr. GRAVES. They are set out in rows, usually 8 to 10 feet apart. Where there is more or less brush, of course, the rows are very irregular. The trees are put out when they are only about two or three years old, and the planting is done very rapidly. In our plantations, which have passed beyond the purely experimental stage, success is exceedingly good. In the Nebraska forests there were a great many failures during the first few years. There is very little failure now. Perhaps the best success we have had is in Michigan, Montana, Colorado, Oregon, and Washington.

Mr. McLAUGHLIN of Michigan. What is your acreage in Michigan?

Mr. GRAVES. We have about 1,200 to 1,500 acres planted, and we expect in a few years to be planting approximately 1,000 acres a year.

Mr. McLAUGHLIN of Michigan. How much land have you in Michigan that you propose to improve in this way?

Mr. GRAVES. Probably, ultimately, it will be desirable to plant 50,000 to 60,000 acres on that forest, and we are hoping that a great deal of the balance of the Michigan forests will come in with natural reproduction.

The CHAIRMAN. What is the cost of planting per acre?

Mr. GRAVES. The cost of planting forests is all the way from \$3 to \$4 up to \$12 an acre, according to the class, roughness of ground, distance from transportation, and various other items of cost that go into any operation of this kind.

Mr. McLAUGHLIN of Michigan. You grow the trees in the nursery, take them to the place where you are going to plant them, and put them in?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. When you speak of the cost per acre, do you take into account all the cost of raising the trees, care of nursery, transplanting, and getting them into the ground?

Mr. GRAVES. Everything.

Mr. McLAUGHLIN of Michigan. I believe you stated that the average cost in one of the previous years was \$7 a thousand?

Mr. GRAVES. \$7 an acre.

Mr. McLAUGHLIN of Michigan. Seven cents apiece for the trees?

Mr. GRAVES. No. Seven mills apiece. We plant just about a thousand to an acre, or a little less. It would be about the same.

Mr. McLAUGHLIN of Michigan. At what age do you transfer these trees?

Mr. GRAVES. Usually when three years old; that is, three years from the seed. That usually means that they have been transplants for one year.

Mr. McLAUGHLIN of Michigan. Using different forests, I presume, depending on the locality and soil?

Mr. GRAVES. Yes; but with very many varieties, after we have learned the trees which grow the best.

The CHAIRMAN. How much of the \$145,000 is to be used for planting?

Mr. GRAVES. That is all expended for planting and planting experiments. Of course, under planting I include also the maintenance of the nurseries.

The CHAIRMAN. How much is for the nurseries and how much for the planting?

Mr. GRAVES. I can not give that offhand without consulting the book. Would you like that inserted?

The CHAIRMAN. Yes, if you please.

(The statement referred to follows:)

Allotment of funds under the item for tree planting on the national forests.

Planting investigations and general supervision.....	\$23, 092
Forest nurseries.....	42, 922
Planting work.....	73, 946
Seed collection and extraction.....	5, 680
Total.....	145, 640

The CHAIRMAN. We will recess now until 2 o'clock this afternoon. (Thereupon, at 12.30 o'clock p. m., the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

FOREST SERVICE—Continued.

The committee reassembled at 2 o'clock p. m., pursuant to the taking of recess, Hon. Gilbert N. Haugen (chairman) presiding, The CHAIRMAN. You may proceed, Col. Graves.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Mr. GRAVES. On page 134, item 247, "for silvicultural, dendrological, and other experiments and investigations," etc., an increase of \$75,000 is requested. This increase may be divided into three general heads, each of \$25,000.

The first has to do with the problem of the present depletion of the forests, which is going on so rapidly, and the need for further information in regard to the situation as it really exists in this country.

The two most acute situations in the country are, first, the supply of pulpwood suitable for the manufacture of news-print paper. The other is the depletion of our hardwoods, particularly the high-grade hardwoods such as are used extensively by the general wood-using industries—those which manufacture vehicles, furniture, agricultural implements, and a great variety of articles made of oak, hickory, ash, poplar, and walnut. The old-growth timber in the East is going very fast. We have been accustomed to draw for most of our uses on the virgin forests; that is, on trees which are 150 years and over in age. That is high-grade material, and it comes chiefly from our original supplies. The old-growth soft woods have been pretty much cut out in the East, with the exception of relatively small areas in some of the Northern States and in the far South. The old-growth yellow pine has not a very much longer life. I do not mean that all of the old-growth trees are going to be cut in the near future, but the larger bodies which go to make up quantity production are not going to last more than about 15 years. That is on the testimony of the lumber manufacturers themselves.

The significance of this is that the yellow pine, which heretofore has been the controlling influence in the general market for soft timber, is giving way very rapidly to the Douglas fir, so that the prices of lumber are more and more governed, even in the East, by the prices of Douglas fir.

Douglas fir is even being sold to-day in Portland, Me., and I was told the other day that in New York State common 2 x 4's of Douglas fir were being sold, with a \$26 freight rate.

The hardwood situation is a critical one for many of our manufacturing industries, which do not know what they can look forward to in the way of supplies. They are coming to us for information, but our information is meager. It will be, of course, impossible to make a complete inventory or survey of the forest resources of the country for anything like the sum asked, but it is desirable to assemble information as fast as possible regarding the situation to meet the demands that are coming and to aid in working out the general broad policy for bringing about better forest practices throughout the country. That is the purpose of the first portion of this increase of \$25,000.

MR. ANDERSON. Mr. Graves, I noticed in reading the explanatory note under this item that the first increase apparently contemplates quite a wide investigation connected with the manufacture of lumber and other wood products, requirements, outputs, domestic and export markets, etc. It is quite clear, I think, that the amount of money that you have here is not going to permit of any such investigation. I do not feel that I would be willing to vote for an item of this sort unless it was understood that it was to be confined to the critical points of this proposition, the hardwood or pulpwood particularly. There is no use of spreading this money out over a wide field because you are not going to get anywhere, it seems to me.

Mr. GRAVES. I think there is a good deal that can be assembled through existing agencies—through lumber associations, State agencies, and others—which would not cost very much. I think you are right in regard to any effort to spread so thin that you would not get anywhere. I would not undertake that. To make a real survey of the whole United States, such as was suggested when the census bill was before the House committee, would cost several million dollars, because that would mean that, State by State, the resources would be surveyed and all of the related problems taken into consideration.

Mr. ANDERSON. Do you have any hope of discovering new sources of pulpwood, or is it rather a question of cultivation or establishment of new pulp forests?

Mr. GRAVES. So far as the pulpwood problem is concerned, I feel that we should have assembled the information in regard to the situation as it actually exists to-day in the East, and in the Lake States, too, where the principal source of manufacture has been. As to new sources of pulp supply, that is largely a question of investigation in the far West. We have in the national forests and in the private forests near them the future supply of pulpwood. That includes southeast Alaska and possibly, ultimately, if the forests do not all burn up, some production from the interior of Alaska, where there is a great deal of good spruce. A great deal can be done through cooperation with existing agencies. The State agencies in New York and Maine, New Hampshire, West Virginia, Minnesota, Michigan, and a number of other States, are gathering information, and our part in that would be to act as a clearing house and bring this information together for the whole country, check it up, and fill in gaps.

Mr. ANDERSON. My impression is that some of these timber concerns are very large, and some of them may maintain quite large investigational or research forces, and that they have very considerable statistical material with respect to the extent of forest resources.

Mr. GRAVES. That is true. In the case of the western forests a good deal of that information is already in our hands. In the East such organizations as the International Paper Co. have, as you say, a research organization and probably have a good deal of information not only about their own lands, but also regarding possible supplies elsewhere upon which they may intend to draw.

Mr. ANDERSON. Do you expect this material to be made available to you, in considerable measure at least, and that you will collate and correlate that information?

Mr. GRAVES. We will serve as a clearing house for that information. In some other places, as with hardwoods, that would not be the case. At the present time the Indiana hardwood manufacturers and wood using industries are extending out for their supplies into Mississippi, Louisiana, and Arkansas, and they are probably less equipped with information than any other class of manufacturers.

Mr. ANDERSON. Is any thing being done now in the way of the importation of hardwoods?

Mr. GRAVES. There is very little hardwood imported except such species as do not grow in this country, used for furniture and other

special uses. At one time there was some oak imported and used for railroad ties, which was brought over from Korea, I think it was, through the Japanese, but that was more of a trial shipment, I think, than anything else.

Our country is going to be drawn on for hardwoods by western Europe when they get into a condition to purchase lumber. Already some of our higher grade hardwoods are being shipped abroad. Western Europe is going to look to Russia, Finland, and Scandinavia for their supplies of ordinary soft wood. For hardwoods they will look to us. So we can look for a drain on our hardwood supply from Europe just as fast as they can finance it.

The CHAIRMAN. In what respect does this line of activity differ from that carried on at the Madison laboratory? The note states, "To investigate the many economic problems connected with the manufacture of lumber," etc.

Mr. GRAVES. It is a question of the economic aspects rather than the technical aspects.

The CHAIRMAN. Do you have a laboratory here in Washington?

Mr. GRAVES. No; the laboratory at Madison is the only one.

The CHAIRMAN. What about the next item?

Mr. GRAVES. The second portion refers to the forest investigations and the studies which we are making in the growth of the different trees, the possible yield per acre under different methods of cutting, the methods of cutting so as to secure natural reproduction, and similar questions. Forestry is still in its infancy in this country. We have a number of experimental stations in the national forests where we are making the studies, but there is a good deal of additional information urgently needed about the growth, reproduction, and methods of treating forests as applied to the Government lands. There is also great demand for investigations outside the public property. Take, for example, the problem of southern pine. The old timber is going very rapidly. The question which is immediately asked when we urge the conserving of the young trees and the use of methods that will encourage reproduction is, How fast will the trees grow? Will it pay us to hold this land if we have some young trees on it; and if so, how can we cut our timber in a practical way so that we can encourage the young growth and make it worth while to protect it from fire afterwards?

It is that class of studies which are included in this item.

We are endeavoring also, in connection with hardwoods, to perfect our technical information in order effectively to encourage small owners of woodlands, farmers, and others to plant hardwood trees such as walnut, ash, hickory, oak, and trees of that kind, which have a large value, and to handle their woodlands intelligently.

A part of this proposed increase would be used in connection with our own experimental stations in the national forest and a part of it in connection with the studies in the East, outside the national forests.

The CHAIRMAN. How many of these experimental stations have you?

Mr. GRAVES. We have six stations. They consist of a headquarters building or two at a point selected to show typical conditions in some region. For example, we have one just north of the Columbia River, in the State of Washington, which is in the heart of the

Douglas-fir region; and already, as a result of the studies there, we have definitely determined how the Douglas-fir stands should be cut in order to get reproduction, information that was not known five or six years ago. We were in the dark or guessing at it, and we were making some mistakes until the experimental work settled the methods.

Mr. ANDERSON. Is there any considerable reforestation being undertaken by private concerns now?

Mr. GRAVES. Very little in the way of actual planting. There are some water companies, mining companies, and wealthy individuals who are undertaking it. In some instances paper companies are beginning systematic reforestation. One of the very large paper companies in Canada is undertaking reforestation on a large scale.

Mr. McLAUGHLIN of Michigan. How large?

Mr. GRAVES. I think it is several thousand acres a year which they expect to plant. They are establishing substantial nurseries. That is the Laurentide Paper Co. They have reached the conclusion that, as a permanent industry, with a very expensive plant and large investments in mills, waterpower development, and so on, it is the best economy to reforest wherever the natural reproduction is not following. They feel that it is going to be more economical in the long run to plant in the more accessible portions of their forests as they are cut over, instead of bringing in timber from long distances, say 25, 35, or 40 years from now.

Mr. McLAUGHLIN of Michigan. That is a more feasible proposition for the paper companies than for some other industries, because paper lumber can be cut when it is quite small.

Mr. GRAVES. Yes; and also because the paper manufacturers, on account of the large investments, must be on a more permanent basis. A sawmill, compared with a paper mill, represents a relatively small investment, and the value can be usually depreciated in a relatively small time. This can not be done with a paper mill, so the question resolves itself into the permanency of ownership. Those who have permanent interests in the lands, like mining companies, would hold the lands because of their mineral value, and they are interested in growing trees on the surface for their own use. That is one of the reasons why mining companies and private water companies are going into forestation. They can possibly charge off some of the expense of holding the land to other uses, and incidentally they raise trees both because they conserve the watershed and because they can in the long run get some income from them. So those are the first enterprises which are chiefly interested.

Mr. McLAUGHLIN of Michigan. Generally speaking, what is the quality of the soil in the South on the southern timberlands from which the timber has been cut? There has been an immense cutting of timber in the South in the last few years. What is the quality of the soil that is left, generally speaking?

Mr. GRAVES. There is a great deal of that soil which is suitable for agriculture, and there is a great deal of it which is very meager. Just as soon as the top soil is leached out it is unproductive and is never going to be permanently cultivated. People may try it, but in the long run a great deal of it is land that is going to be chiefly valuable for trees and will ultimately revert to trees.

Mr. McLAUGHLIN of Michigan. In the southern climate trees grow more rapidly, and it would seem to me a good field for reforestation.

Mr. GRAVES. There are certain pines that grow very rapidly. There is the loblolly pine, often called North Carolina pine, that grows as rapidly as the western Douglas fir. In the far South, in certain locations the longleaf pine and also the slash pine grow very rapidly. There is an excellent opportunity for forestry enterprises with that very rapid growing slash pine or longleaf pine, which can be used for turpentine when it is 23 or 24 years old, and, if the right kind of methods are used, a continuous production can be taken from it for 25 or 30 years without weakening the tree, as is done in France.

Mr. McLAUGHLIN of Michigan. It seems to me that in our Southern States where so much timber is being cut, especially from land which is not very good for agriculture, reforestation ought to be encouraged.

Mr. GRAVES. The next part of this item is the proposal that I have for that, sir. That is the third part of this increase and is primarily for cooperation. We have one man now in the South. He is a thoroughly practical fellow. He has been well trained in forestry and has also had very long experience in lumbering. He is working with the different owners, studying with them the possibilities of forestry, investigating their economic problems, and pointing out to them the possibilities for the practical handling of their lands for growing trees. There are many places in the South where, even from the standpoint of the ordinary investor to-day, it will pay to hold lands covered with second growth and to encourage a regrowth on those areas which is not covered to-day.

Mr. McLAUGHLIN of Michigan. But, largely and as a general proposition, individuals will not go into that reforestation. It takes too long. An individual buys, for instance, in the southern countries for the timber; and he manufactures it and gets out just as soon as the timber is gone. He does not buy with the idea that the land was very valuable, and he sells the land for anything he can get. It is practically so with the company that was organized to operate on that land. When the timber is gone the company goes out of existence and they quit, and for the reason you have stated, that it takes a long time for the trees to grow, and the individual will not undertake to go into that proposition on a large scale.

Mr. JONES. He can not afford to pay the taxes on the land while the trees are growing.

Mr. McLAUGHLIN of Michigan. You might encourage some of them to take it up, but my impression is that you will not get very far. It would seem to me, therefore, that the public in those States ought to do it; they might be encouraged by your bureau to do it.

Mr. GRAVES. I feel that there is a public aspect to it, but I do not feel that it is either practical, necessary, or desirable that the public should undertake the whole problem. I think a great deal can be accomplished through systematic fire protection and right methods of cutting.

Mr. McLAUGHLIN of Michigan. Fire protection is only for the protection of the timber until the time comes for cutting it.

Mr. GRAVES. I feel that there should be fire protection of the young trees as well; and that would be practical under such systems as we are already inaugurating in a number of States. The States

themselves must participate in the fire-protective work. We are going to stop the destruction by fire and other causes. There will follow an immense amount of young growth which will come on and furnish growth for the future.

I believe that with the cooperative enterprise, the recognition of the practical consideration of taxation, and other things, we can in the long run bring about an immense amount of forest renewal. The educational work or cooperative work we do would not be merely to persuade some lumber operator, who has bought some land and expects to go out in 15 years, to develop forestry. We would not expect that. We have got to begin at the beginning. The result of this work will be the development of general interest in this whole problem and bring about State legislation to prevent fires and secure constructive practices of forestry which, taken all together, will go a long way toward solving the problem.

MR. JONES. How many States are purchasing land and reforesting it?

MR. GRAVES. I think there are probably 15 or 16.

MR. JONES. About how many States in the Union have a condition where they ought to do that?

MR. GRAVES. Practically every State that has natural forest conditions. I believe that even Ohio ought to acquire some forests in the southern part of the State, a rough country where the forests are rapidly deteriorating every year. These would constitute a center of cooperation and as demonstration grounds, places from which the public could work with private owners and perhaps make a tremendous step in advance throughout the region.

MR. JONES. What objection have these States made, if you have had any correspondence or conference with them on it, as to why they do not start propaganda of that kind?

MR. GRAVES. It has usually been inertia. The public does not realize the importance of it. They look on it somewhat as a private individual does—that it takes a long time to grow trees and that, if they do not do it this year, the consequence will not be serious; so they let it go and nothing happens.

MR. JONES. Do you think that the Federal Government should force them to act?

MR. GRAVES. The Federal Government can not force them to act. I think the Federal Government could act as a stimulus, a clearing house of information, and guide; and it could, through such measures perhaps as our cooperative fire protection, stimulate action by the States by making cooperative contributions from the Government contingent on wise and effective action by the States.

MR. McLAUGHLIN of Michigan. It occurs to me that in the South, where they are cutting timber so fast, some of the land may be good for practical agriculture and that some of it which may be taken up for agriculture may not be suitable for that purpose, at least in a profitable way. It seems to me it would be well if those States would profit by the experience of other States and acquire some of that poorer land that is good for forestry and use it for reforesting and not permit it to be put to agricultural use, because it will be an ultimate failure if they attempt to use it for agricultural purposes.

MR. GRAVES. I know the Federal Government by its studies and cooperation does wish to point that out.

Mr. McLAUGHLIN of Michigan. Yes; but not to do the work in connection with it, because it is of such importance and interest to the State itself that it seems to me they ought to do it. Years ago in Michigan there were great pine forests. Private parties acquired the land, and their first cut was only of the very best pine timber, because that was all for which there was a market. Then, after that cutting, they let the land go back to the State for taxes. The State, instead of holding that land (because there was still a lot of good timber on it that later came into the market), provided a way for selling it. It was bought, and the time that elapsed allowed the land to improve; the timber increased in size, and the market for timber changed so that the poor timber found a market. That land was sold by the State, after it had been acquired for taxes, and the new purchaser cleaned off what was good, and then let it go back to the State again for taxes, and we lost all the timber again.

Now, it seems to me that that condition exists in many places in the South, with reference to the lighter land; and if they would profit by the experience of our State, for instance, after the first cutting, when they have a chance to get the land through the lapse of taxes, they ought to hold it and have forest reservations there.

The CHAIRMAN. In your opinion, is the supply increasing or decreasing?

Mr. GRAVES. The supply of timber is being depleted very rapidly, and the supply of merchantable timber, taking it as a whole in the United States, is losing ground every year.

The CHAIRMAN. To what extent?

Mr. GRAVES. I think that the growth is probably less than one-third of the use and loss, measured in terms of merchantable timber. I am speaking of growth which will produce trees of a quality and character that ultimately could be sawed, and not of mere cubic feet of wood. The difficulty is that our second growth, which comes up naturally under fire and abuse, is of such a low grade that there are great areas of the country covered with second growth of little potential value. It is low grade in character, and crooked, and never will make anything of value.

The CHAIRMAN. Take the next item, 248, "For estimating and appraising timber and other resources on the national forests," etc., an increase of \$45,000.

Mr. GRAVES. This increase is in part for appraisals of timber for sales which are coming on. About \$20,000 of the increase will be used for that purpose. The item was formerly \$100,000, and was reduced to \$80,000 during the war because the demand for new sales of timber fell off so rapidly that we did not need the money. The demand for timber is increasing again and we have already a good many different tracts of land which have got to be examined, cruised, and appraised before sales can be made. Southeast Alaska presents one of the most interesting fields for new development and the establishment of paper plants. There are there splendid opportunities for water-power development. The spruce and hemlock grow there in great abundance, in heavy stands, and accessible to water. There is offered one of the best opportunities in the country for large development. We have now very little information of sufficiently exact character to make sales now, and that would be one of the places where we would make important timber surveys.

The CHAIRMAN. It is in order to keep up with the increased business?

Mr. GRAVES. Yes, sir. As an illustration of the increased business, already this year our receipts are running about \$160,000 ahead of last year, which shows the activities in the lumber industry.

Mr. McLAUGHLIN of Michigan. In some of these other items you told us you employed a lot of men whose duty it was to do this very estimating and appraising of the timber for sales.

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. Can they not do it under the other appropriations without having this money for it?

Mr. GRAVES. No, sir; these surveys are for important sales and the new sales of large bodies of timber. They involve special crews.

Mr. McLAUGHLIN of Michigan. Every sale is important, is it not?

Mr. GRAVES. I should not have used that word in that connection. There is an immense number of small sales, whose appraisal is handled by our local officers, who have miscellaneous other duties also. The item in question provides for appraising timber in large sales, where it is necessary to send a regular organized crew to spend the entire season going over and mapping the ground, cruising, and determining the amount and value of timber.

Mr. McLAUGHLIN of Michigan. When you make these sales is the timber cut clean?

Mr. GRAVES. No, sir; usually not; but the timber is always designated for cutting. In cases where the trees can be selected here and there, every tree that is to be taken out is marked. Where is certain stands in the Northwest, such as the heaviest white pine and the Douglas fir the trees are all about the same size and about the same age, it is impossible to make selective cutting. There we cut clear in blocks or patches; otherwise, if you left individual trees standing, they would be blown over. Provision is, of course, made in the location of those areas for leaving blocks of trees which will stand in order to seed up the ground.

In the majority of cases, however, it is not necessary to cut clear, but a portion of the stand is left, amounting from the standpoint of actual quantity of timber, to from 15 to 25 per cent of the merchantable volume, but a larger percentage of the individual trees, because those which are left are small or of the middle size, while the mature and older trees are cut.

Mr. RUBEY. I notice you have a great many employees with different titles. I can usually tell by the title what character of work the employee does. There may be some of colleagues on the committee who may not know what a xylotomist is, and for their information I would like to have you tell us what a xylotomist is. It appears among the list of employees on page 131.

Mr. GRAVES. A xylotomist is a civil service designation which I hope before we get through we can get changed. He must be a trained microscopist, who—

Mr. RUBEY. What is that?

Mr. GRAVES. The man who who holds this position has been studying the structure of wood. He is an expert in cutting slides and examining the structure of wood under the microscope.

Mr. JONES. Let me tell Mr. Rubey that the difference between a microscopist and a xylotomist is \$900.

Mr. GRAVES. I might insert in the record that the work this man is doing is of very real, practical value, because he is making these studies in connection with the study of our strength tests. We want to know why woods fail under different stresses, and to determine that we examine the wood after it has been tested and learn the effect on the structure.

Mr. McLAUGHLIN of Michigan. I supposed the laboratory at Madison was doing that.

Mr. JACOWAY. Mr. Rubey has exhibited his ignorance here, and I want to get in the same class with him. What is the meaning of the terms "silviculture" and "dendrology," on page 134?

Mr. GRAVES. "Silviculture" is a technical term for forest production, forest growth and culture. That is a general term which we apply to measures for natural reproduction, replanting, or other work that looks to the continuance of the forests. "Dendrology" is a term applied to the study of an individual tree or species, as contrasted with the study of the development of the whole forest. It is rather the botanical side, contrasted with the forestry side.

The CHAIRMAN. Let us hear you on the next item.

Mr. GRAVES. The next item is on page 136, item 249, "For other miscellaneous forest investigations," etc. The real purpose of the requested increase of \$25,640 is to aid in the bringing about of better public sentiment in the national forest districts regarding our protective work. I have been very much concerned by the large number of man-caused fires in the forests. Lightning, of course, is something that we can not control, but carelessness in the woods is something which should, in the long run, be reduced to a minimum. We can stop the man-caused fires in two ways. One is by law enforcement and the other is by a better public sentiment.

The law enforcement we are taking care of through our regular organization and through the local departments, and we have already gained a good deal in that direction. For example, in California this past season there were over 200 convictions for starting forest fires in the national forests through carelessness or otherwise, and the result of that action has been widespread and very beneficial. At the same time, there is a great deal that can be done in the way of improving public sentiment in the different regions, and I should like to have attached to each of my district headquarters a man who can handle that side of the work. It is a question of public education in meeting with organizations of all kinds and getting out informational matter, pictures, exhibits, and things of that kind. I would like to go to the schools so that the children in the schools will learn something of the value of the forests and the need for care of them. That would take a large part of the proposed increase.

I would like also a small addition, a little over \$3,000, in connection with our maps. We have our maps photolithographed by the Geological Survey, and a little more money is required for that.

The CHAIRMAN. The next is item 250, "For the construction and maintenance of roads, trails, bridges, fire lanes," etc.?

Mr. GRAVES. This is an item for various improvements in the national forests.

The CHAIRMAN. Is this outside of the percentage allowed for roads?

Mr. GRAVES. Yes, sir; this is for improvements of all kinds.

The CHAIRMAN. You have a road fund, have you not?

Mr. GRAVES. We have a special road fund, yes.

The CHAIRMAN. Why do you include roads in this item?

Mr. GRAVES. That is the wording which has always been there, and I think it is desirable to leave it, because very frequently there are small stretches of a road which a few men could handle and under this appropriation they have authority to do it.

Mr. ANDERSON. What is the amount of the permanent appropriation that would be available for roads and trails in the forests next year?

Mr. GRAVES. There are two items, one of \$1,000,000, under section 8 of the Federal-aid road act, in cooperation with the States, and \$3,000,000 under the amendment to that act passed last year, making altogether \$4,000,000.

The CHAIRMAN. That is in the Post Office appropriation act?

Mr. GRAVES. Yes, sir. The work of building roads is being handled by the Bureau of Public Roads of the Department of Agriculture.

Mr. ANDERSON. I notice in your report that you refer to the 10 per cent item.

Mr. GRAVES. I should have added that also. Ten per cent of our receipts are available for roads in the national forests, which makes about \$450,000 for that purpose.

The CHAIRMAN. They are the gross receipts, including those for grazing privileges?

Mr. GRAVES. Yes; the gross receipts, which amount to about \$4,450,000.

Mr. McLAUGHLIN of Michigan. That 10 per cent goes to the States?

Mr. GRAVES. Twenty-five per cent goes to the States and is spent by them for roads or schools.

Mr. McLAUGHLIN of Michigan. Then the States get more than that?

Mr. GRAVES. Ten per cent of the gross receipts is expended by the department itself in the construction of roads, and these other items come under the Federal-aid road act.

Mr. McLAUGHLIN of Michigan. Then, the States get 45 per cent?

Mr. GRAVES. In the original Federal aid road act, section 8, it was provided that 10 per cent of the gross receipts from those forests in which the road projects are located should be set aside for the reimbursement of the moneys appropriated for the national forests.

Mr. McLAUGHLIN of Michigan. Before we had any road act the law provided that a certain percentage of the receipts from the sale of timber should go to the States for certain purposes, for roads and schools.

Mr. GRAVES. Twenty-five per cent.

Mr. McLAUGHLIN of Michigan. Is that all?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. Did they not get another percentage for something else?

Mr. GRAVES. Ten per cent was appropriated later for the construction of roads within the national forests.

Mr. McLAUGHLIN of Michigan. I thought the States got something besides the 25 per cent?

Mr. GRAVES. No, sir; I am right about that.

The CHAIRMAN. Let us get clear exactly what is to be deducted from your receipts. There is 10 per cent for building roads?

Mr. GRAVES. Ten per cent of the receipts for the construction of roads by the Government; 25 per cent—

The CHAIRMAN. That is paid to the State?

Mr. GRAVES. Is appropriated to the States.

The CHAIRMAN. For roads or schools?

Mr. GRAVES. For roads or schools.

The CHAIRMAN. What else?

Mr. GRAVES. Another 10 per cent from those forests in which the road projects are located is set aside in the Treasury as against the appropriation under section 8 of the Federal aid road act.

Mr. McLAUGHLIN of Michigan. Is there not some direction to you as to how you shall use the 10 per cent fund for road building? Are they such roads as you want for your exclusive use or such roads as may be maintained for general use?

Mr. GRAVES. I do not recall the wording of the act, but the thought behind it was that the roads built within the national forests would necessarily help in the development of the community, and, of course, we are using the money in that spirit.

Mr. ANDERSON. How much?

Mr. HARRISON. Mr. McLaughlin, you will find those provisions on page 297 of the Book of Estimates.

Mr. ANDERSON. How much of this appropriation under this item is used for the construction of roads and trails in the national forests?

Mr. GRAVES. About \$100,000 of it was used in the last fiscal year for road and trail construction. This was in addition to maintenance.

Mr. ANDERSON. Is any of it used for new construction?

Mr. GRAVES. Yes; about \$100,000. This year we are doing our new construction of roads and trails primarily from the other item, and under item 250 we are endeavoring to catch up with the urgent demand for telephone lines and other improvements.

Mr. ANDERSON. What I want to know is whether any of this item is used for new construction?

Mr. GRAVES. This year probably very little of it. The design was to have the new construction taken care of chiefly from the other fund, but some trails will have been built in connection with the general improvement fund.

Mr. JONES. What character of roads were built; were there many different types, or are you using the word "trails" generally?

Mr. GRAVES. The word "trails" refers to the trails built in the forests primarily for purposes of fire protection and to open up and make the forests accessible. Those are the horse trails. The roads are well-graded, gravel roads. They are built, at least as far as all the major projects are concerned, under the direction of the Bureau of Public Roads. We are not building paved roads.

Mr. JACOWAY. What does it cost you a mile to build them?

Mr. GRAVES. They run all the way from \$2,000 to \$20,000 a mile. I have in mind one section of road in the State of Washington, which goes through a very heavy timber and is of heavy construction, which

to-day would cost \$20,000 a mile, but that is not a paved road; it is a dirt road.

Mr. JONES. Did you deduct the value of the stumpage that you cut off of these rights of way?

Mr. GRAVES. That would go into a separate item.

Mr. JONES. The cost of cutting the rights of way, the cost of felling the trees in the rights of way, was in the neighborhood of \$20,000 a mile.

Mr. GRAVES. That is for the entire cost of construction.

Mr. JONES. The salvage you got out of the stumpage is not deducted, is it?

Mr. GRAVES. No. I suppose when you come to the Bureau of Public Roads that Mr. McDonald will go into the details regarding the forest roads and the cost of construction under different circumstances.

Mr. JONES. In your statement of receipts from stumpage sold from any of this land, have you given credit for stumpage that was taken off of these roads?

Mr. GRAVES. Everything that is sold in the national forests is shown in the item of receipts.

Mr. JONES. And the actual cost to the Government for constructing this road would be the \$20,000 less what you got for the timber through these rights of way?

Mr. GRAVES. Yes; but that is not the average price by any means.

Mr. JONES. The cost of one road was \$20,000 a mile?

Mr. GRAVES. Yes; \$5,000 or \$10,000 a mile is the average cost of these mountain roads.

Mr. JACOWAY. In those States where they have improvement districts, or where there is a bond issue and they want to join up in order to build roads in the State, you cooperate in the State movement, do you not?

Mr. GRAVES. Yes. The Federal aid road act is a cooperative act, and there is cooperation in each State in these roads. In the amendment to the act last year, carrying further appropriations, the question of cooperation is made discretionary. So that, where roads are entirely within the forests and are more important to the Government than to a community, the Government may build the entire road without cooperation.

Mr. JONES. Is any part of the \$550,000 asked for here used for the work contemplated by that miscellaneous item of \$1,000,000, on page 271 of this report, that we pass every year?

Mr. GRAVES. No; that is entirely for fire emergency.

Mr. JONES. Yes.

Mr. GRAVES. That is entirely a question of fighting fires and fire suppression.

Mr. JONES. It does not include fire lanes, telephone lines, and all those things?

Mr. GRAVES. No. In connection with fire suppression, there might be some lanes built around the fire which, in short sections, might serve afterward; but they are not built for that purpose.

The CHAIRMAN. How much of this money is used for building fences?

Mr. GRAVES. About \$77,000 for fences, altogether. That includes \$29,000 for fences here and there on boundaries designed to control

the stock. We have a great many places where we really have trouble with trespass, which we find it is absolutely impossible to prevent until we are able to put drift fences here and there along the boundary, and the other \$48,000—

The CHAIRMAN. Are you responsible for the trespassing of the animals?

Mr. GRAVES. No, sir; but we want to keep the stock off the national forests, and there are two ways of doing it.

The CHAIRMAN. This is for keeping them off the forests, not from the farms and cultivated lands?

Mr. GRAVES. There are places where there is grazing land bordering the forests, where the tendency is for outside stock to drift onto the forest. It is impracticable to keep range riders on the boundary lines all the time, which is about the only way you can keep them off unless you build fences here and there.

Mr. McLAUGHLIN of Michigan. Why do you not want them to go into the forests?

Mr. GRAVES. They are not permitted to go on. They overstock the land.

Mr. McLAUGHLIN of Michigan. They are grazing on public lands?

Mr. GRAVES. Either on public land or private land.

The CHAIRMAN. Then the bulk of this increase is to be used for building fences?

Mr. GRAVES. Fully half of this increase would be used for fences.

Mr. ANDERSON. How are we going to justify the constantly increasing expenditures for range improvements without any increase in the grazing returns?

Mr. GRAVES. I think the justification for that would be that in many instances we shall have to take stock off of the forests unless we do make some improvements. There are conditions where, without fences, the stock can not be controlled and the lands are becoming overstocked; or the cattle drift upon the summer range too early in the spring and injure it. It is in such circumstances a question, in order to protect the forest, of either taking off the stock or putting in some drift fences.

In other instances there are areas where we could undoubtedly put on an increased number of stock with drift fences. Mr. Jardine has estimated that with these improvements we could add to the present number of stock about 18,000 head of cattle and about 56,000 head of sheep.

Mr. JONES. What added revenue would that bring?

The CHAIRMAN. About \$15,000.

Mr. JONES. At what expense?

Mr. ANDERSON. \$100,000.

Mr. GRAVES. That would be for one year.

Mr. JARDINE. That is the increase that we estimate we can take care of by a better handling of the stock and by opening up new areas. This increase will be used largely to take care of the stock, which must be removed from areas now overgrazed. It simply means we are oversold. We are behind our sales. Part of the expenditure will be to prevent the necessity of large reductions in stock. I tried to make clear this morning that a 4 per cent reduction would perhaps be the minimum limit, and that would amount to approximately \$100,000 reduction in grazing fees annually.

Mr. ANDERSON. If you increase the fees you would probably accomplish a reduction without much difficulty.

Mr. JARDINE. It depends, of course, on the increase. If you increase them beyond the limit of economic production, there would result a decrease in stock. You might increase them beyond their actual value and not produce a decrease, because in some cases there are salable crops on lands which would be unsalable without this grazing, and the men would have to pay the excess grazing fee out of their income from those crops rather than go out of business.

The CHAIRMAN. How do you keep them off at present?

Mr. JARDINE. We do not keep them off. That is the trouble. Let me cite one case that I examined this last summer in Nevada: A large area of foothill and desert adjoins the forest. Stock drift onto the forest. The range is in extremely bad condition, and we would have to have one rider for every mile on duty 24 hours a day to keep the stock off.

The CHAIRMAN. How much does it cost per mile to build a fence?

Mr. JARDINE. The cost approximately is about \$150 a mile on an average.

The CHAIRMAN. You have 1,600 miles now. How many miles would be required to fence in the whole forest?

Mr. JARDINE. I could not say offhand. The figures for next year's estimates for boundary fences are 228 miles and for other fences 335 miles.

The CHAIRMAN. Two hundred and twenty-eight miles is only a drop in the bucket.

Mr. JARDINE. It is a drop in the bucket, but it will take care of some of the more urgent cases, such as I mentioned here, where we can not function without them.

The CHAIRMAN. What will be the ultimate cost if we go into it on a wholesale scale?

Mr. JARDINE. I could not say. I do not believe it will be necessary on a wholesale scale if the ranges adjoining the national forests are eventually placed under administration, with proper cooperation, so that we can eliminate this outside drift. Then it will become a matter of individuals taking care of their stock and preventing trespass. As it is now, it frequently costs far more to prevent trespass than it would cost to put up fences.

The CHAIRMAN. What is being done to keep the stock on the reservations from trespassing on other lands?

Mr. JARDINE. There is very little done to keep the stock on the reservations from trespassing off. There is a good deal being done to keep them from trespassing within the forests. Individuals owning stock are expected to keep them from trespassing, and some of these other fences are to facilitate that work.

You can not, even by law, require something that is absolutely impracticable.

The CHAIRMAN. You have a sort of reciprocal arrangement?

Mr. JARDINE. There is very little tendency to drift off of the ranges in the national forests, because the outside ranges in summer are so dry that stock do not drift off. They all drift to the forest.

Mr. McLAUGHLIN of Michigan. Mr. Graves, I find on page 297 a provision for paying to the States a portion of the money received from forest reserves. I find that there is 25 per cent of the total

paid, not only for the sale of timber but from grazing and money received from every other purpose, and 5 per cent more is paid to the State for the same purpose for schools and public roads. It also says:

At the close of the fiscal year there shall be paid by the Secretary of the Treasury to the State, as income for its common-school fund, such proportion of the gross proceeds of all the national forests within said State as the area of lands hereby granted to said State for school purposes which are situated within said forest reserves, whether surveyed or unsurveyed, and for which no indemnity has been selected, may bear to the total area of all the national forests within said State.

You say you paid, as I understand the figures, \$85,000 for that purpose last year, and then a percentage additional out of the receipts of the national forests must be spent for the purpose of building and maintaining roads and trails within the State, and you have opposite that item \$500,000, so that, altogether, there comes out of the total revenues of the forests for this year \$1,785,000. I thought there was something going to the States.

Mr. GRAVES. Subsection 11 refers to Arizona and New Mexico.

The CHAIRMAN. Is that the Jones amendment?

Mr. GRAVES. Those are lands which otherwise would have been transferred to the States, granted to the States.

The CHAIRMAN. Is that what is commonly called the Jones amendment?

Mr. HARRISON. It was adopted in 1910, Mr. Haugen.

Mr. GRAVES. I think this provision was adopted in the enabling acts when the Territories became States.

Mr. McLAUGHLIN of Michigan. Thirty per cent of the total receipts of the forests goes to the States for schools and roads; 10 per cent more must be spent on roads and trails within the forest; and the policy is to construct those at such places as will be of benefit to the States. Those are measures to connect with roads the States have constructed outside of the forests.

Mr. GRAVES. That 5 per cent in the following section refers to lands acquired under the Weeks law.

Mr. McLAUGHLIN of Michigan. I was not speaking of that. The Weeks law is an out-and-out appropriation for the purchase of lands, is it not?

Mr. GRAVES. The act of March 1, 1911, was the Weeks law. First there was granted 5 per cent of the receipts to the States, and afterwards, on June 30, 1914, that was increased to 25 per cent, so as to place the new forests on the same basis as the rest of the national forests. The act of March 1, 1911, does not apply to the western national forests but only to the new forests.

That was changed afterward to 25 per cent, so they are all on the same basis now, receiving 25 per cent.

The CHAIRMAN. The next item.

Mr. GRAVES. In the same paragraph there is a request for some additional authority for the purchase of ground where necessary for the location of ranger stations. That is on page 138.

The CHAIRMAN. Why should you need more land, with the millions of acres that you have?

Mr. GRAVES. Frequently any land suitable for a ranger station which is owned by the Government is very inconvenient from the standpoint of the users of the forests, placing the ranger at a remote

and inconvenient point. Just to give an illustration, I have in mind a forest that I visited last year, where the ranger had to go about three-quarters of a mile off the road. In other cases the stations are 2 or 3 miles off the traveled road. This means that anybody who wants to reach him on business must take a long side trip. If the ranger is located near the road or a village he can handle his business better. There is less loss of time in his getting mail and supplies; he is more in reach of help in fighting fires, and users can get better service when they need a permit for wood or other material, when trouble occurs regarding adjustment, etc. An accessible forest officer is of greater service than one who is hard to reach.

Mr. McLAUGHLIN of Michigan. In that particular case who owns the land at the point on the road?

Mr. GRAVES. It is owned by a rancher. It would be necessary to purchase a site convenient to the public where we could put up a ranger station. This is very frequently the case, because lands near the roads so frequently have already been taken up. Sometimes it is desirable to have the ranger in a community where the land is private, but where there are no houses or rooms for rent. It should be borne in mind that the ranger station is an official headquarters. It is the ranger's office as well as his home.

The CHAIRMAN. The \$200 we gave you last year was not enough to go around?

Mr. GRAVES. That was for a particular site for a forest nursery for the Michigan National Forest.

The CHAIRMAN. You want \$5,000?

Mr. GRAVES. You will notice we are not asking for an additional appropriation.

The CHAIRMAN. You want \$5,000?

Mr. GRAVES. We wish authority to spend as much as \$5,000 of a standing appropriation to buy ten or a dozen sites during the year.

The CHAIRMAN. How about the new language?

Mr. GRAVES. The other new language is merely a change to make the item, which has appeared year after year, continuing legislation.

The CHAIRMAN. That has reference to publications?

Mr. McLAUGHLIN of Michigan. The present language says "no part of this appropriation," which might mean the entire amount of money carried by the Agriculture bill, or the appropriation for the Forest Service. I notice you propose to change "no part of this appropriation" to "no part of any funds appropriated for the Forest Service."

Mr. GRAVES. That law has always specifically applied to the Forest Service. The purpose is to leave it out by making it continuing legislation. The change proposed makes the provision apply to any funds that may be appropriated this year or any other year. There is no change in the sense of the clause at all.

The CHAIRMAN. The next item is 251, on page 140, "To enable the Secretary of Agriculture more effectively to carry out the provisions of the act of March 1, 1911," etc.

You have asked an increase of \$6,700?

Mr. GRAVES. That is in connection with the Weeks Act. This paragraph makes no appropriation. It merely places a limitation on the amount of money which may be expended in the city of Washington.

Authority is here requested to spend up to \$28,470 in connection with the expenses in Washington.

The CHAIRMAN. That expenditure is limited to Washington?

Mr. GRAVES. It comes out of the Weeks fund; this is merely authority to be able to spend that amount of money in the city of Washington.

The CHAIRMAN. The amount is needed?

Mr. GRAVES. Yes, sir. That finishes the main portion of the bill.

Mr. HUTCHINSON. Before we leave that I would like to ask you one or two questions. Have you in your bureau a grazing bookkeeping department separate from the other?

Mr. GRAVES. Yes, sir. We have not these last two years kept track of the time of the individual forest officers who may engage on various activities. Previously we did, and we are going to resume that as soon as we can get fully readjusted from the war conditions.

Mr. HUTCHINSON. I notice here, under item 248, note (b), you have a \$25,000 increase to provide for additional range surveys, estimates, and plans of grazing management.

Mr. GRAVES. Everything of that sort is kept separate.

Mr. HUTCHINSON. And in item 250 you have a \$100,000 increase for the management of the ranges.

Mr. GRAVES. The first item you speak of—

Mr. HUTCHINSON. I understand what it is for, but what I want to get at is whether this grazing proposition is a paying proposition to the Government, or whether there is any velvet in it at all, or not. It is of no benefit to the national forests, is it, to have these sheep there, unless it reduces the cost of living or something like that?

Mr. GRAVES. The direct benefit to the forest is in keeping down the vegetation, and there is a very real contribution in the way of fire protection. There is not the slightest question that the grazing does help in fire protection, because it does keep down the dry grass.

Mr. HUTCHINSON. The matter has been brought up here that we are not charging enough to the people who use the ranges, and that is what I want to get at—whether there is any benefit from these sheep and cattle going on the national forests.

Mr. GRAVES. The greatest benefit is the economic one of utilizing the resources in the production of stock and in building up communities.

The CHAIRMAN. We are very grateful to you Col. Graves.

(Thereupon the committee proceeded to consider estimates for another bureau.)

Statement of projects, activities, and expenses under lump funds, Forest Service.

	Allotment, 1920.	Estimate, 1921.	Increase.	Decrease.
Item 81—Forest supervisors, deputy supervisors, rangers, and guards:				
(a) For administration and protection of 147 national forests.....		\$1,673,540	\$1,673,540
(b) For administration and protection of 1,095,022 acres added by Congress Oct. 29, 1919, to Idaho and Payette National Forests, Idaho.....		10,000	10,000
Total.....		1,683,540	1,683,540

¹ This amount formerly carried on statutory roll, which is correspondingly decreased. The apparent increase is therefore not an actual increase.

¹ Included in the Forest Service portion of the Agriculture appropriation bill for 1920.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Tuesday, January 6, 1920.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman), presiding.

The CHAIRMAN. Mr. Harrison, who do you desire to appear this morning?

MR. HARRISON. Mr. Chairman, if it is agreeable to the committee, we will take up the estimates of the Bureau of Chemistry this morning, which appear on page 141. Dr. Alsberg will present them.

BUREAU OF CHEMISTRY.

The CHAIRMAN. The committee will be glad to hear Dr. Alsberg.

STATEMENT OF DR. CARL L. ALSBERG, CHIEF OF THE BUREAU OF CHEMISTRY, DEPARTMENT OF AGRICULTURE.

Dr. ALSBERG. Mr. Chairman, I understand it is your desire to have us present the general situation, so far as our bureaus are concerned, before we go on to details. The most important factor in the Bureau of Chemistry at the present time—the most important difficulties—are the personnel difficulties which are the result of the existing dislocated industrial conditions. The bureau has been losing each year for the last two or three years about 40 per cent of its technically trained people. These losses have not been among the minor men exclusively, but have included many of the leaders of the work. They have gone out from the bureau not because they were dissatisfied with the Government service; not because they preferred industrial work; not because they were to receive from 50 to 300 per cent increases in income; but simply because, in many cases, the Government salaries were such that they could not break even at the end of the year under the most economical conditions of living. Very much against their wishes they were compelled to leave the Government service.

The result is there has been a pretty complete disorganization and disintegration in the bureau's force and in its organization, so that we are in pretty bad shape, though not in any worse shape than other Government services that I could mention. It won't take very long before the bureau will have what amounts to pretty much a new and green force, with very few people left in it who are experienced or trained for the work. In short, we are just

falling to pieces. That is the present situation. What can or should be done about that is not for me, Mr. Chairman, to say.

I have a list here, in a statement which I have prepared for insertion in the record, giving a series of specific instances of losses from the personnel of the kind I have described. The situation at the present time is so serious that we are not going to have any kind of a properly trained organization left very shortly; we are pretty thoroughly disintegrated and disorganized.

Dr. C. S. Hudson, one of our ablest research men, who was in charge of the carbohydrate laboratory of the bureau, and who received a salary of \$4,000 per annum, resigned to take up consultation work paying \$8,000 and commissions. He is making not less than \$12,000 per annum, or three times the salary he received from the Government.

Dr. Mary E. Pennington, whom most of you know as having been in charge of the poultry and egg work of the bureau, and who received a salary of \$3,780, resigned to accept a position with a commercial firm in New York at a salary of \$10,000.

Dr. H. D. Gibbs, who was chemist in charge of the color laboratory at a salary of \$3,500 per annum, resigned to accept a position with the Du Pont Co. at a salary of \$10,000 per annum and a bonus which will net him a considerable additional amount.

Dr. J. A. LeClerc, who was the chemist in charge of our plant analysis laboratory at a salary of \$3,000 per annum, resigned to accept a position with a commercial concern at \$5,000.

The loss of these and other people from the bureau who are in direct charge of important lines of investigational work results in a serious delay in the production of results. Not only have we lost many of our chemists in charge of important lines of work, but the second and third and fourth men in line for these positions in many instances have resigned to accept positions in the commercial world at salaries at from two to three times as much as they received from the Government.

Mr. J. K. Dale, who was under Dr. Hudson, was in charge of the sirup investigations and received a salary of \$2,280 per annum from the Government. He resigned to accept a position with a commercial food concern at a salary of \$4,000 per annum.

Mr. Conover, who was the second in charge in the color investigation laboratory, has resigned to accept a commercial position in Pittsburgh at a very much larger salary than he received in this bureau.

While it is not possible to mention in a brief space all the men who have left the service of the bureau, the following will indicate to you the increases which our chemists are receiving:

Mr. H. S. Bailey, who received \$2,760 per annum, resigned to accept a position at \$4,000 per annum.

Mr. E. Bloomberg, who received \$1,800 per annum, resigned to accept a position at \$5,000 per annum and bonus.

Mr. R. M. Bohn, who received \$1,200 in this bureau, accepted a commercial position at \$2,400 per annum.

Mr. E. D. Clark, who received \$3,000 per annum in this bureau, resigned to accept a position paying \$6,000.

Mr. J. L. Clay, who received a salary of \$1,620, resigned to accept a position paying \$2,600

Mr. J. K. Dickson, who received \$1,440 in this bureau, resigned to accept a position paying \$3,000.

Mr. C. D. Geidel, who received \$1,800, resigned to accept a position paying \$3,000.

Mr. Samuel Ginsberg, who received \$1,620, resigned to accept a position at \$3,800.

Mr. W. T. Johnson, who received \$1,800 in this bureau, resigned to accept a position paying \$4,000.

Mr. H. A. Lubs, who received \$2,040 in this bureau, resigned to accept a position paying \$3,000 per annum.

Dr. E. C. Merrill, who received a salary of \$2,280 in this bureau, resigned to accept a position paying \$3,500 per annum.

Mr. L. A. Round, who received \$2,520 in this bureau resigned to accept a position paying \$4,000 per annum.

Mr. R. R. Williams, who received a salary of \$2,240 per annum in this bureau, resigned to accept a position paying \$5,000 per annum.

This list includes only a few of the men who have left to accept better salaries.

We are losing not only a number of our chemists and investigational men, but also our food and drug inspectors, and for the same reasons.

Mr. J. A. Earnshaw, a food and drug inspector of this bureau receiving a salary of \$2,000 per annum, resigned to accept a position at \$3,600 per annum.

Mr. D. F. Fisher, an inspector who received a salary of \$1,800, resigned to accept a position at \$2,250 per annum.

Mr. J. R. Garner, who received a salary of \$2,500 per annum, which is the highest salary paid food and drug inspectors, resigned to accept a position at \$3,500 per annum.

Mr. H. C. Kitchen, a food and drug inspector at \$2,000, resigned to accept a position at \$3,000 per annum.

Mr. Herman Lind, a food and drug inspector, receiving \$2,040 per annum in this bureau, resigned to accept a position at \$4,700 per annum.

Dr. H. A. McIntyre, who received a salary of \$2,040 per annum, resigned to accept a position at \$3,000 per annum.

Mr. W. W. Paine, a food and drug inspector who received \$1,800 in this bureau, resigned to accept a position paying \$4,400 per annum.

These are but a few instances of a number I might mention. Last year we lost 20 per cent of our inspection force, and we receive additional resignations every month.

I also understand it is your wish to have me present the views of the Bureau of Chemistry with reference to making these lump-sum positions statutory. I can only say, gentlemen, that the disorganization that is now taking place, owing to the disproportion of the salaries in the service as compared with the cost of living, will be infinitely accentuated by placing the chemists and technical employees upon the statutory roll. To make their places statutory will put them up against the hopeless outlook of having their promotion depend upon the death rate of their superiors.

That is what it will mean, gentlemen. At the present time, we have been able to keep some of the more able younger men as a

result of the loss of our high-priced men. In other words, some of the more promising men we have been able to keep in the hope of training them to fill the more responsible positions, because the salaries which have become available and many salaries have become available, when the older men at the higher salaries resigned, are to some extent available, if the secretary consents, for increasing the salaries of some of the younger men who would otherwise leave us. In consequence, we have pursued a policy of contracting our force, a contraction which we have not brought about by laying anybody off, but which has come about by virtue of men resigning and not having their positions filled. We have not been able to get, at salaries we are able to pay, competent men to fill them; and I would sooner have the work contracted and less work done than to load up the service with incompetent men we will never get rid of.

Now, if all of these salaries were made statutory and this crisis either continued or a similar crisis should arise five years from now, or 10 years from now, and all the positions were statutory, it would be quite impossible to do anything for anybody. We would have to promote men only when somebody resigned or somebody died. If a vacancy occurred that could not be adequately filled, we would be confronted with the dilemma of filling that vacancy with a man who was not competent to fill it or else have the money revert into the Treasury, instead of making that money available as it is at present, for the readjustment, as near as we can, of the salaries of the men who are thoroughly deserving.

Mr. McLAUGHLIN of Michigan. You said you would rather contract your work than to employ incompetent men you can never get rid of?

Dr. ALSBERG. Yes.

Mr. McLAUGHLIN of Michigan. Do you mean if you employ a man and find him incompetent you can not get rid of him?

Dr. ALSBERG. I mean, Mr. McLaughlin, that it is very hard at the present time in any Government service to get rid of a man who is not competent, because we have to prove inefficiency, and inefficiency is the hardest thing in the world to prove. He may be a man who does his work conscientiously and does it reasonably well, but he is not a good investigator, let us say, and there is not any good handle that you have for getting rid of him.

Mr. RUBEY. Can you not just tell him that you do not need his service any longer and that after the first of next month he must find another place?

Dr. ALSBERG. No. If I could do that—

Mr. RUBEY. Why can you not do that?

Dr. ALSBERG. Because of the procedure necessary to carry out the spirit of the civil service laws. Of course, if I could do that and if I had the power to select the best man I could find and if I had the salary available to hire him when I found him, I could, and every other bureau chief could, make the Government service more efficient than it is at the present time. I do not want to seem to be claiming that our service is particularly inefficient (I do not think it is, of course), but I recognize there is room for a great deal of improvement and the ability to get rid of people without difficulty and the ability to get people without the great difficulties there are

now in the way of getting specially trained men, hampers us very seriously in making our service as efficient as possible.

The CHAIRMAN. In what respect are you hampered in making selections, Doctor?

Dr. ALSBERG. You go to a first-class research man in a high-grade institution, and you ask him whether he will come into the Government service. In the first place we can not pay the salaries that to-day are commensurate with the salaries being paid for such services on the outside. Five years ago the salaries were rather better in the Government service than they were, say, in the agricultural colleges and State universities. Nine times out of 10 he will say, "The salary does not interest me." That is one handicap. Suppose the salary does interest him, then you say, "Well, you know, there are certain things you have to do; you have to take a civil service examination." You explain to him that that civil service examination is one that will not give him, because he is a thoroughly competent man, any special difficulty in passing.

A man who is 40 or 45 years old and who has a respected position in the country, very frequently regards the requirement of having to pass a civil-service examination as a personal indignity. He does not need the Government job especially. He has a satisfactory job. He comes to the Government because it gives him perhaps a little more opportunity, or because he believes in changing his line of work once in a while. But man after man, when I thought the whole thing was arranged, has refused to take the civil-service examination. He will say, "My standing in my profession is such I do not see why I should have to take a civil-service examination, and I won't do it."

Then suppose you get him to take the civil-service examination; he may fall under the apportionment in such a manner that some far less competent man happens to be certified and you have to take him.

Mr. McLAUGHLIN. Do you have to take a man you feel yourself is not competent?

Dr. ALSBERG. Usually I take nobody in such cases. Our usual method to leave the place vacant rather than to fill it, until somebody who is competent is qualified. It happens, of course, very frequently that places are vacant for six months or a year, because nobody on the civil-service registers, in our judgment, seems competent. Very frequently we get a good average man and lose the genius, which would not be the case in industrial life, for example.

Mr. HUTCHINSON. Suppose you do take a man and afterwards he proves to be inefficient; you say you can not get rid of that man?

Dr. ALSBERG. Oh, you can get rid of that man, but it is very difficult. You have to prefer charges. Such men are not dishonest, they are not crooked, they are doing their work the best they are able according to their abilities; but they just do not happen to have that degree of ability which you think should go with the job. Then you have to prefer charges, unless you can induce him to resign, which they sometimes will do. You prefer charges and there has to be a regular trial and you have to prove inefficiency. Of course, if a man is crooked (which almost never happens, at least to my knowledge in the department, very rarely at any rate), there is no difficulty; but if it is just a matter of judgment whether a man

is efficient or not efficient, competent or not competent, it is very difficult.

Mr. McLAUGHLIN of Michigan. If he is on the lump-sum roll, can you not reduce his salary and appoint him where he would not want to take it?

Dr. ALSBERG. Yes; certainly that can be done. But you will recognize, gentlemen, that that is a very unsatisfactory way of dealing with the situation, because if you do that you have a sorehead in your organization, you have somebody who is unhappy and discontented, and that reflects on the whole esprit de corps. It would be much better if such people could be gotten rid of promptly.

Mr. McLAUGHLIN of Michigan. It seems to me in this scientific work, or the kind your bureau is doing, that your opinion, approved by the Secretary of Agriculture, as I suppose it must be, would decide the matter, and that the question of retaining that man would practically be up to you and the Secretary.

Dr. ALSBERG. It is, Mr. McLaughlin, but when you have—

Mr. McLAUGHLIN of Michigan. This committee and the Congress itself may not have been liberal in the matter of salaries—

Dr. ALSBERG. I think this committee has—

Mr. McLAUGHLIN of Michigan. I feel—it is my own opinion any way—that the men ought to be well paid and they ought to be competent men in every instance, and we have to rely on you.

Dr. ALSBERG. You are right.

Mr. McLAUGHLIN of Michigan. It is not encouraging to us to feel that money is appropriated for men who are not competent for the places, and it is rather discouraging to feel that the modus operandi is such that the incompetent man must be retained.

Dr. ALSBERG. I do not mean to create the impression, of course, we have a large number of incompetent men.

Mr. McLAUGHLIN of Michigan. I was not suggesting that, but inevitably you will get some who are not competent. Must they remain?

Dr. ALSBERG. They do not, as a matter of fact, but it takes time to get rid of them.

Mr. McKINLEY. As I understand it, you are making this argument to show that, in order to keep the competents there, you must have a lump-sum appropriation instead of a statutory roll?

Dr. ALSBERG. That is the point exactly, sir; that at the present time it is possible, if you get a young man who is particularly remarkable and competent, to move him along; you can raise his salary and you can soon get him into a leading position; whereas, if we had the statutory places only, he would not be promoted unless somebody in a statutory position at a higher salary died, or resigned, or was dropped. That is the situation exactly. Under the present circumstances, we happen to be in a position where we can not get competent men, owing to the abnormal conditions, and we can contract our force and give a few particularly desirable men the necessary little increase of salary with the money that is made available from places that can not be filled. All that would be impossible if they were on the statutory roll.

Mr. McKINLEY. In other words, you feel this way—that, rather than have \$1,000,000 allotted to individual places, you would prefer to have \$700,000 or \$800,000 in a lump sum?

Dr. ALSBERG. Absolutely, sir.

Mr. MCKINLEY. You would get better results?

Dr. ALSBERG. We would get more efficiency and get nearer 100 cents for the dollar than we would under the other scheme.

The CHAIRMAN. Doctor, you have had lump sums all this time?

Dr. ALSBERG. Yes.

The CHAIRMAN. And you are complaining now that it has not worked out?

Dr. ALSBERG. No, sir; I am not complaining—

The CHAIRMAN. You said the service was disintegrating and started to state the handicap. What is the handicap in making your appointments?

Dr. ALSBERG. The largest handicap is the present scale of salaries; that is the largest handicap. The next handicap is the difficulty of getting people through the civil service under existing conditions. That is not the fault of the civil service; that is the fault of the conditions.

The CHAIRMAN. Are there any others?

Dr. ALSBERG. Those are the two main handicaps. I was going on to show that to put the men on the statutory basis would add a tremendous additional handicap, because every man would then know he could never expect a promotion unless somebody in a statutory position paying more than the position he held resigned, or died, or was dropped. If that is known, we won't be able to get anybody into the service if he can get a place somewhere else.

The CHAIRMAN. You furnish us every year with an estimate for salaries, and we assume, of course, when you furnish us this list that is what you intend to pay.

Dr. ALSBERG. That is quite right.

The CHAIRMAN. Are we to understand now that does not amount to anything? Are we just to brush it aside and pay no attention to it?

Dr. ALSBERG. No, sir.

The CHAIRMAN. What does it mean if it does not mean what is stated in the estimates?

Dr. ALSBERG. It does, but it varies each year and there are changes each year. What you see printed here now covers readjustments it is proposed to make when this appropriation becomes available. It does not represent what is going on this year. That was forecast as nearly as it was humanly possible to forecast it, when the present appropriation estimates were submitted. It has not been adhered to absolutely this year, because we have lost 100 men. This represents, as nearly as it is humanly possible to forecast, what we expect to do during the coming year. Does that answer your question, Mr. Chairman?

The CHAIRMAN. Of course, you will be left some leeway, but, if you propose to do anything and if we appropriate money for a certain purpose, why should it not be written into the law?

The CHAIRMAN. You make your estimates stating that you are going to pay these scientists so much. We do not know who you are going to employ; that is for you to determine. You furnish us with an estimate stating that you propose to employ so many at such a salary.

Dr. ALSBERG. There is no reason why a chemist who is now getting \$3,000 should not be put on the statutory roll if that salary could be changed or modified from time to time. But what is the practical result of doing it? It means if in two or three or four years we come before a committee and ask that committee to increase that man's salary, \$200 or \$500, it is not done either by the committee or—

The CHAIRMAN. I beg your pardon, Doctor; we have increased salaries where you have never estimated for increases. You have never had any trouble, when you have made a showing for an increase in salaries, in getting the increase. We carry you on the statutory roll.

Dr. ALSBERG. Yes.

The CHAIRMAN. Why could not some one under you be carried on the statutory roll as well?

Dr. ALSBERG. That is very true, Mr. Chairman, but it must be known to you that statutory positions, as a matter of fact, are only changed with the greatest difficulty. The Secretary of Agriculture has on several occasions endeavored to have the statutory salary of the Chief of the Bureau of Plant Industry, and, I believe, also the Chief of the Bureau of Animal Industry, increased, just to take a technical position which happens to be statutory as an example. He has endeavored on a number of occasions to have the salaries of those two officers raised by \$1,000 and he has never succeeded in doing it. That has been attempted now for a number of years. I do not know where the failure was, but that is a matter of no consequence. The same thing applies to the clerical positions. Time and time again an effort is made to have the salary of some one on the clerical roll raised \$200.

The impression I meant to convey was that whenever a position is made statutory it is almost impossible to get Congress to change that salary and the man resigns when \$200 or \$500 would keep him in the service.

Mr. RUBEY. Let me make this suggestion right there: It has frequently happened that the committee here has recommended to Congress a number of changes, but points of order have been made against them and they have gone out.

Dr. ALSBERG. I know. I was not criticizing the committee.

The CHAIRMAN. It is quite true, Doctor, that a number of increases have been made without the recommendation of the Secretary. We have increased salaries in the past and I have an idea the committee will increase some of the salaries this time, although no recommendations have been made by the Secretary.

Dr. ALSBERG. I do not mean to imply that; I am well aware those increases of statutory positions have usually gone out on points of order in the House and I am also well aware that this committee has frequently not recommended increases in positions because they feared they would go out on a point of order in the House and they did not wish to jeopardize the more important features of the bill by having somebody make a point of order.

The CHAIRMAN. As you know, nearly every salary in this bill can be increased without raising a point of order.

Dr. ALSBERG. Then I am mistaken.

The CHAIRMAN. Why not some of these people on the statutory roll? I do not contend we should put all of them on the statutory roll, but it is a business way of doing things to put some on, they should go on.

Dr. ALSBERG. I think there are certain very definite reasons. One reason is, as I have just endeavored to indicate, it is very difficult to have the statutory salary modified in any direction.

The CHAIRMAN. You have to go to Congress to have it modified and Congress has to pass upon it.

Dr. ALSBERG. Congress has not at the present time exercised its authority with reference to these positions, so that there could be no question about getting around Congress, because Congress has chosen not to exercise its authority. Of course, if Congress fixes these positions as statutory positions, there could be no attempt and will be no attempt made to get around Congress. That is not at issue. It is merely the difficulty of having Congress, which has many important things to do besides worrying about an individual salary—of getting Congress to modify the salaries from year to year to meet the requirements.

The CHAIRMAN. Of course, you understand Congress can not examine the candidates and ascertain their efficiency and merit. We must necessarily rely upon your statement. If your statement warrants an increase, the increase is made; but if you fail to make a showing, of course, the committee rejects the recommendation, and it should do so. In certain instances, of course, we have to turn money over in a lump sum and have its use discretionary with somebody else. Possibly you should have discretion in the matter of statutory positions, but, in our opinion we feel that we would not be doing our duty if we did not make these places statutory positions where it is possible to do so. It seems to me that if you would take the committee into your confidence, the matter might be ironed out and satisfactorily disposed of. I think that sort of arrangement would at least be more satisfactory to Congress and to the country at large. The country is not satisfied with everything that is being done by the Government. We are not finding fault with this department.

Mr. HARRISON. The greatest difficulty is in making specific estimates for salaries so far in advance.

The CHAIRMAN. You have made them before: you have estimated every year.

Mr. MCKINLEY. Is not this your trouble—I find it so in our business: For instance, these salaries go in effect the 1st of next July and about the 1st of next September the man you are counting on is offered 50 per cent more in private life and he resigns from the department, and you can not estimate for that ahead?

Dr. ALSBERG. That has happened in the last year probably 50 times, Mr. McKinley, and we can not estimate ahead for that. Another reason is you gentlemen appropriate a certain sum of money to do a certain piece of work and you will specify certain positions that should be filled under that sum of money. We will estimate "one chemist at \$4,000, two at \$3,000, two at \$2,000, and two at \$1,500," or whatever the number may be. Then a situation arises such as Mr. McKinley has just stated; the \$4,000 man resigns on you

and goes to a commercial company at \$10,000 or \$12,000. That is what is happening right along at the present time. Perhaps you can not find a \$4,000 man to fill his job, and you either have to let that money lapse or appoint somebody you could really get for less money to take the \$4,000 job. Then if you do not appoint anybody, the money lapses and the work is not done efficiently.

Mr. McLAUGHLIN of Michigan. As to the Civil Service Commission, I presume you prescribe or you determine the qualifications and the character of the examination that is taken, do you not?

Dr. ALSBERG. Yes; and the Civil Service Commission is giving us very excellent service. I do not want to be understood as criticizing, but the point is, lots of people, the best men, will not take the civil-service examination. The best men do not have to look for a job and do not want to be bothered.

Mr. McLAUGHLIN of Michigan. I can understand that, but I do not understand why the Civil Service Commission or the authority that passes on your suggestion of dropping a man is not willing to take your recommendation when they follow it entirely in the matter of the examination and selection of the men.

Dr. ALSBERG. They do not do it entirely, Mr. McLaughlin. Our people do not read the papers. That, of course, would make a farce of the examination. I simply specify "this is the training, this is the experience, these are the qualifications that are needed to fill the job," and the Civil Service Commission does all the rest of it. We do not have any control over that.

Mr. HARRISON. The Civil Service Commission may change these requirements and does so on occasions, usually after consultation with the officers of the department.

The CHAIRMAN. Just one more word about salaries. In every well and properly conducted business there is always a discussion as to the salaries. The man at the head of the organization is authorized to carry out the decision made, and it is his duty to do it. Any business that does not do that is not worthy of confidence. I think Mr. McKinley will agree with me that his associates, in whatever enterprise they are interested, handle it in that way; I know a thorough business organization would not undertake to do business in any other way.

Mr. MCKINLEY. We would probably do this: The board of directors would say to the manager "Now here, you get this man for \$5,000 a year, but if you can not get him for \$5,000 and you have to pay him \$7,000, we will allow you the \$7,000."

Dr. ALSBERG. That is just what the lump-sum funds permit within the \$4,500 limit which Congress has placed on salaries paid out of the lump-sum funds.

The CHAIRMAN. That is exactly what is proposed to do to put a number on the statutory roll where there is no question about the salary being changed and then leave a sufficient amount, a leeway, to take care of the others.

Mr. ANDERSON. You could settle all this very easily by just getting rid of the high cost of living.

Dr. ALSBERG. If you can put the cost of living back to where it was in 1914, my difficulties in running the Bureau of Chemistry would be solved, because it all practically comes back to the disproportion of salaries to the cost of living.

Mr. MCKINLEY. Is this your idea, that we are now under abnormal conditions, and if the matter could slide along for a year or two, until we know definitely whether salaries are going to stay so high or whether they are going to come down, you could run your department better with lump-fund appropriations than you could if we put them on the statutory roll just now?

Dr. ALSBERG. I think so. Of course, I am assuming something would be done, temporarily, in the meanwhile; otherwise I won't have anybody left the way it is going now. Of course, if you want to let things slide and build up a new organization two years from now when you know what is going to be done, that could be done, and we can hold together some kind of a limping, half-organized affair for a year or two under existing conditions, and then you might start again.

The CHAIRMAN. You are asking for \$428,090 on the statutory roll. According to your contention, that ought all be wiped out and a lump-sum appropriation of \$428,090 substituted.

Dr. ALSBERG. I could run the Government's business more efficiently if that were done, and with a less amount.

The CHAIRMAN. Then you are in favor of wiping out the statutory roll and substituting a lump-sum appropriation?

Dr. ALSBERG. With reference to this matter of losing men, might I make just one more point, and that is when you lose an investigator who has been at work on a problem which Congress wishes to have studied you lose more than you do when you lose an executive or a clerk, because you lose what he has got in his head, and he can not ever put that down on paper for his successor to use. You lose the fruits of several years of his work, and no system you can devise can prevent it. He goes off and you have to get another man who has to familiarize himself with the work—to train himself in that work. You are apt to lose at least a year and sometimes two or three years' salary.

The CHAIRMAN. Just one word. The fact is practically everybody in the Government service is underpaid as compared with the salaries paid on the outside. Is not that a fact?

Dr. ALSBERG. Yes, Mr. Chairman; but you do not have to pay, in the Government service, the salaries you pay on the outside. There are other attractions.

The CHAIRMAN. I think it is quite generally agreed that the employees of the Government are underpaid. The question is, Would you make a permanent increase or would you authorize a bonus? Would the bonus be the proper way, in an emergency?

Dr. ALSBERG. I have not given that feature of it very much thought, Mr. Chairman. Of course, that is a way to play safe, because, should living conditions come back to normal, it would be a very much simpler matter to wipe out the bonuses than to reduce or scale salaries down.

The CHAIRMAN. In your opinion, what increase should be made for scientists? The clerks would, of course, come under the same rule as clerks in the other departments, but the scientists in your department are in a class by themselves.

Dr. ALSBERG. It would be necessary for me to have an increase of somewhere in the neighborhood—I hope you won't misunderstand me—of 40 to 50 per cent, in order to be able to keep all the best.

men. As a matter of fact, the best men I have lost, I could not have kept without the ability to increase their salaries. In different cases it varies from 40 to 50 per cent.

The CHAIRMAN. The fact is you can not compete in all cases?

Dr. ALSBERG. We make it a rule in the bureau and in the department not to meet an industrial salary and not to keep a man by meeting an industrial salary purely because he gets an offer from the outside. If we began doing that, we would disorganize our force, because they would all go around and angle for commercial positions.

The CHAIRMAN. Is it not a fact when new corporations are formed that they select men from the department, because of the prestige that they give the concern?

Dr. ALSBERG. That is very true.

The CHAIRMAN. Then salaries do not cut much figure, and you could not meet that kind of competition?

Dr. ALSBERG. We do not meet that kind of competition.

The CHAIRMAN. Taking the general run of things, how do the salaries compare?

Dr. ALSBERG. I think we would have to increase the salaries so as not to lose our men too fast, as I said, from 30 to 50 per cent. We expect that the Bureau of Chemistry will be used as a training school in part and we do not regret it when a man, who has been with us for five or six years, goes out as chief chemist of a manufacturing concern with whom we have had a great difficulty under the food and drugs acts, because we know the moment he gets in there and takes charge our difficulties with that concern are ended; they cease to violate the law and we have accomplished more than we could if that man stayed in the bureau and prosecuted those people.

The CHAIRMAN. The Department of Agriculture is really a school?

Dr. ALSBERG. The department is a school; but, Mr. Chairman, we do not want to lose our second string men and at the present time we are losing them. As far as losing our skilled men is concerned, we expect to lose them, but we always want enough of the understudies on hand to work in their places; and at present we can not do it. We have lost one man this year, for instance, at about three times the Government salary. Now, we do not expect to keep such a man; but we do not want to keep his understudy and we lost him, too.

There is another point that I wish to bring to your attention, and that is the great need we have in the Bureau of Chemistry for more space. I suppose everybody has made that plea. We moved into our building in 1909, and at the present time have practically very little more space to-day than we had then. We are terrifically cramped for working space in the bureau.

The CHAIRMAN. That is a matter that is determined by the Secretary. We make a lump-sum appropriation for that.

Dr. ALSBERG. I know that, but I wanted to raise the point for your consideration when later you consider the matter of rent.

The CHAIRMAN. Yes.

Dr. ALSBERG. With reference to the total appropriation for the bureau we ask for a net increase of \$32,900, which is only 3 per cent

increase of our total appropriation. This is asked for, because it is the smallest sum we can figure which will enable us to carry on the work on its present basis efficiently. In addition to that, there is an item which interests the bureau.

The CHAIRMAN. Do you care to comment on the statutory roll further?

Dr. ALSBERG. I have only one comment to make on the statutory roll, Mr. Chairman, and that deals with the inspectors.

The CHAIRMAN. Then take up item 16 on page 141 first.

Dr. ALSBERG. You mean these two multigraph operators, at \$1,000 each.

The CHAIRMAN. Yes.

Dr. ALSBERG. That is simply a change in designation and not a new position or a change in salary. The object of the change of designation is to give us greater latitude in the nature or the qualifications of the person with whom we fill the position.

The CHAIRMAN. Item 28, page 142, is the next, "one assistant, \$1,600, changed to 1 clerk, class 3."

Dr. ALSBERG. This is not an increase and not essentially a change. This particular employee has qualified as a food and drug inspector and has been appointed to a then existing vacancy on the food and drug inspection force, and we want to fill the position with a purely clerical employee. It is not a new position; it is a change in designation.

May I comment on items 23, 24, 25, 26, and 27, page 142?

The CHAIRMAN. Very well. Item 26 is for 11 food and drug inspectors.

Dr. ALSBERG. It is the whole food and drug inspection group from 23 to 27, inclusive.

The CHAIRMAN. This will not appear in the bill. I want the hearings to show exactly what we are discussing, so if we refer to the title of that item we may know. Item 23 is for 13 food and drug inspectors, at \$2,000 each.

Mr. HUTCHINSON. Are these food and drug inspectors chemists?

Dr. ALSBERG. Not as a rule.

Mr. HUTCHINSON. Then you do not have any chemists at all on the statutory roll?

Dr. ALSBERG. There are no chemists, as such, on the statutory roll, excepting myself. There are a few chemists, a few men who happen to be chemists, among the drug inspectors. Occasionally a man who is a chemist will ask to be transferred to fill a vacancy on the inspection force and if he is competent the transfer is made, but his status is not that of a chemist. The fact that he is a chemist is an accident.

Mr. HUTCHINSON. Following that up, item 66 for a \$50,000 appropriation is a lump-sum appropriation, is it not?

Dr. ALSBERG. Yes, sir.

Mr. HUTCHINSON. You can pay those chemists any salary you want?

Dr. ALSBERG. Yes, sir; within the limit of \$4,500 fixed by law, with the consent of the Civil Service Commission. The only technical employee on the whole bureau roll whose position is statutory is mine.

Mr. HUTCHINSON. That is what I wanted to get at.

Dr. ALSBERG. The points I want to comment on here are the 13 food and drug inspectors, at \$2,000 each, in item 23; item 24, 13 food and drug inspectors, at \$1,800 each; item 25, 1 food and drug inspector, \$1,620; item 26, 11 food and drug inspectors, at \$1,600 each; item 27, 10 food and drug inspectors, at \$1,400 each; all on page 142 of the estimates. The comment I wish to submit is this:

The difficulty we have had in securing and retaining competent inspectors at the scale of salaries now paid has been pointed out. To aid us somewhat in meeting the difficulties we were having in this respect the Secretary of Agriculture has given permission to me to recommend to you that the following change be made in the statutory roll: Page 142, item 23, change from 13 food and drug inspectors, at \$2,000 each, to 20 food and drug inspectors, at \$2,000 each. Under item 27 eliminate 10 food and drug inspectors, at \$1,400 each. The effect of these two changes will be to increase the entrance salary for food and drug inspectors from \$1,400 to \$1,600 and to decrease the number of inspectors from 53 to 50, and will make the total appropriation for the salaries of food and drug inspectors exactly what it is in the present bill.

In my opinion we can secure a higher degree of efficiency in the inspection work in the enforcement of the food and drugs act by having a smaller number of higher grade inspectors than with the slightly larger number of lower-grade men. We can unquestionably secure a higher average of ability with an entrance salary of \$1,600 than with an entrance salary of \$1,400. As pointed out to you previously, it is impracticable to secure men of the caliber needed for inspectors at an entrance salary of \$1,400. This change not only will not increase the total amount for the salaries of food and drug inspectors, but will effect a small saving in that the traveling expenses for 50 inspectors will be less than would be the traveling expenses for 53 inspectors. It is our intention, if this change is approved, to keep the number of inspectors at 50, and not to appoint any inspectors on the lump-fund rolls. The effect of this change will, therefore, be to give us a higher grade of ability among our inspectors without additional total expense to the Government.

It is our intention, if this change is approved, to appoint the new inspectors as vacancies occur at the entrance salary of \$1,600, and to promote the more experienced efficient men to the \$2,000 positions if there are remaining in the service a sufficient number of the experienced inspectors who have demonstrated a degree of efficiency that will entitle them to these promotions. In case there should not be in the service at that time a sufficient number of experienced inspectors with the degree of efficiency which justifies promotions, some of the higher positions will be filled by original appointment, providing the bureau can obtain men of qualifications sufficient to justify paying these salaries.

I urgently recommend that these changes in the statutory roll be made in the interest of the efficiency enforcement of the food and drugs act.

The CHAIRMAN. You drop 10 food and drug inspectors at \$1,400 and add 7 in item 23 at \$2,000?

Dr. ALSBERG. Three go out entirely. We change 23.

The CHAIRMAN. You really drop only three?

Dr. ALSBERG. It reduces the force by three inspectors.

In other words, we prefer to have 50 men at better salaries than 53 men such as we can get. As a matter of fact, at the present time, of the 10 food and drug inspectors' places at \$1,400 apiece, about 5 are vacant. We have not been able to fill them, and, if I may be permitted, I will read a letter in that connection which is one of several we have received. It is a letter addressed to the chief clerk of the bureau by a man to whom the position had been offered and who was on the civil-service register. [Reading:]

Seymour, Ind., November 17, 1919.

BUREAU OF CHEMISTRY,
Washington, D. C.
Attention of Mr. S. A. Postle.

DEAR SIR: I have been traveling for the above firm for the past few weeks and have not been able to answer your letter concerning position as drug inspector. How any man with good sense would consent to take a job doing anything and doing it anywhere for \$1,400 is beyond me, when the railroads and coal mines offer such excellent opportunities.

Seriously, I couldn't possibly live on such a wage.

Very truly, yours.

M. E. JENNINGS,
523 North Walnut Street.

P. S. You met me yourself several times last winter. Did I look like a \$1,400 man to you?

The CHAIRMAN. The total salary would be \$1,640?

Mr. MCKINLEY. You mean with the \$240 bonus.

Mr. HARRISON. They do not get the bonus when they first come into the service; we can not promise it to them.

Dr. ALSBERG. Not until they have been with us for some time.

The CHAIRMAN. How long?

Dr. ALSBERG. Six or eight months.

Mr. HARRISON. It has to be a month or more.

Dr. ALSBERG. Usually they get it after six months.

Mr. HARRISON. We do not promise the bonus to a new employee. We simply ask him if he will accept appointment at the basic salary for the particular position in view. The question of giving him the bonus is determined later on the basis of service actually rendered.

The CHAIRMAN. If they are certified, it is \$1,640?

Mr. HARRISON. We take the view that certification can not be made in the case of new appointees until they have rendered at least one month's satisfactory service.

The CHAIRMAN. If they don't take the bonus into consideration, we might as well wipe it out.

Dr. ALSBERG. When the places are offered to men they are told that there is a bonus that they may get any time within six months. Usually it is several months before they get the bonus.

The CHAIRMAN. If a man makes good, is he entitled to the bonus?

Dr. ALSBERG. They usually get it after several months. We can not promise it to them.

Mr. HUTCHINSON. Is it not in the law that they are to get the bonus?

Mr. HARRISON. The law says that employees who have entered the service since June 30, 1918, or who have been promoted by more than \$200 since that date, can receive bonus only after certification

by the head of the department that their ability and qualifications are such as to justify it. An employee has to render service before we can determine what his ability and qualifications are. The bonus is not a matter of right in such cases.

Dr. ALSBERG. Usually they are appointed under civil service for a probationary period. We would not know for six months whether we want to keep the employee or not. We could not legally give that man his bonus until we had determined that he was efficient enough to have a permanent appointment. So in cases where we are not certain until the end of the probationary period he does not get his bonus until after six months.

The CHAIRMAN. Do all of them have to wait six months?

Dr. ALSBERG. In the Bureau of Chemistry it runs from three to six months.

Mr. HARRISON. In no case in the department has the bonus been granted to an employee who has served less than one month. All new appointees are required to serve at least a month before they are considered for the bonus, and the period will vary from one month to a year.

The CHAIRMAN. The whole matter is left to the discretion of the Secretary?

Mr. HARRISON. Only in the case of employees who have entered the service since June 30, 1918, or who have not received a promotion of more than \$200 since that time.

Dr. ALSBERG. In the case of the inspectors, I do not feel myself justified in passing on their qualifications until they have served six months, and, therefore, I do not feel justified in recommending the bonus until I am sure they are good enough to keep. It takes us about six months.

I think that covers all of the statutory roll.

The CHAIRMAN. The next item is No. 64, on page 144, the introductory clause for general expenses. Is there any change in that?

Dr. ALSBERG. No.

The CHAIRMAN. Do you care to make any comment on it?

Dr. ALSBERG. I would prefer to comment on the individual items. This is just the general authority for the bureau's work. Item 65 is "for conducting the investigations contemplated by the act of May 15, 1862, relating to the application of chemistry to agriculture." There is no change requested in that, Mr. Chairman.

The CHAIRMAN. What is the character of that work?

Dr. ALSBERG. The character of the work is in the first place carrying on the chemical side of agriculture investigations partly in collaboration with other bureaus carrying on the chemical work; for instance, for the grain breeding and selection work of the Bureau of Plant Industry. We do the chemical end of that work and a great deal of similar work of that kind. At the same time it involves the carrying on of physiological investigations in cooperation with the Bureau of Plant Industry.

The CHAIRMAN. Is it done in cooperation with the other bureaus of your department?

Dr. ALSBERG. Yes. We do the chemical side of the agricultural work for the Bureau of Plant Industry, chemical work on insecticide, fungicide, and all that sort of thing.

The CHAIRMAN. How about item 66, "for collaboration with other departments of the Government desiring chemical investigations," and so on.

Dr. ALSBERG. In item 66 an increase is requested. The reason for that request grows in part out of the war. During the war the various departments of the Government outside of the Department of Agriculture, particularly the Army and Navy, though, of course, also the Department of Justice and the Post Office Department, made tremendous demands on the Bureau of Chemistry for analytical and for other laboratory work. We spent probably on this kind of work for the War Department and for the Navy Department and the Department of Justice upward of \$100,000 a year during the war. Of course, it had to come out of other funds and we felt justified in doing it owing to the emergency.

Mr. ANDERSON. Did those departments furnish you with any additional funds?

Dr. ALSBERG. They did not furnish us with any additional funds. They did furnish us with some help. They have carried the salary, I should say, of perhaps a dozen chemists, something on that order. I can not give the exact number.

Mr. JACOWAY. Did they furnish any additional equipment?

Dr. ALSBERG. No additional equipment. Of course, the work has become less, but during the last year we analyzed a total of more than 20,000 samples for other departments than the Department of Agriculture. Of course, this is like all cost accounting; you can vary the figure according to how you distribute your overhead. I estimate that it costs us approximately \$89,000, or an average cost of \$4.28, which we believe is a very low figure for that type of work.

Mr. ANDERSON. Do these analyses relate to articles produced by the other departments, or are they investigational in character?

Dr. ALSBERG. They are not investigational in character, except in so much as some kind of investigation may be necessary to give an intelligent opinion for the other department. They are practically all Army and Navy matters, supplies, contracts, and specifications. For the Department of Justice and for the Post Office Department they are of a different nature. For the Department of Justice they may be almost anything from testing for poison in a man's stomach, done for a local United States attorney, to determining alcohol in some beverage that the United States attorney wants information about.

Mr. ANDERSON. I understand, for instance, that the Navy Department has an experimental bureau of its own at which it tests the various articles subject to test for the use of the department. I think the same thing is true of the Army. I am sure that the Commissioner of Internal Revenue has a force of chemists.

Dr. ALSBERG. That is true, Mr. Anderson. Our work in these lines has been largely limited to food and drug analysis, to physiological work, except some special work that we have done for the Department of Justice. Our work for the Army and Navy has been limited to foods and drugs and leather, which we happen to be working on, and one or two other things. The Army and Navy have their laboratories, which do not do much of that particular

kind of work. Also very little of this work is done in the neighborhood where their laboratories exist. We have 18 laboratories scattered from Seattle and San Francisco to Boston, and it is economical for the depot quartermasters or the navy-yard commandants in the same town where we have a laboratory to telephone, "We are going to send you such and such a sample. Please analyze it and report." They can have it done on the spot and get the report telephonically, followed by a confirmation. They prefer this to sending it to Washington or the Brooklyn Navy Yard or the Picatinny Arsenal, or wherever the Army or Navy laboratory may be.

Mr. ANDERSON. In a case of that kind, is the cost of making the analysis paid out of this appropriation or does it come out of the ordinary appropriations for those departments? In other words, are not these men working on salaries which are paid anyhow? How do you account for investigations made in that way?

Dr. ALSBERG. So far as this appropriation has been available it has been allotted to this work. You see, we have in our own small way our own budget system. On the 1st of June every man in charge of a laboratory submits to me an estimate of what he is going to need for the conduct of the laboratory or a special line of work during the fiscal year beginning the following July. On the 15th of June I give him his budget. I give him a statement: "You have to the credit of your laboratory so much on the books of the bureau." In making these allotments this fund is prorated so far as it lasts. Of course, during the last two years it has not been enough to cover the amount of work required. After consultation with the local people as to their requirements during the coming year we prorate the available funds. That, in the main, is how this fund is divided.

Mr. MCKINLEY. What chemical work is done by the Bureau of Standards?

Dr. ALSBERG. The Bureau of Standards does a lot of work of the same type on products other than food and drugs.

Mr. MCKINLEY. Do you do any work except on food and drugs?

Dr. ALSBERG. Occasionally we do other pieces of work. Do you mean for other departments?

Mr. MCKINLEY. Yes.

Dr. ALSBERG. We do work on food and drugs and leather, and occasionally test for waterproofing and mildew proofing of tentage.

Mr. MCKINLEY. Why should you instead of the Bureau of Standards, do it for leather?

Dr. ALSBERG. There is no reason why we should do the testing of it.

Mr. MCKINLEY. Do you do the testing?

Dr. ALSBERG. A little; not much. They do most of the testing.

Mr. TINCHER. You say you carry that under another item. You mean there is another appropriation for testing leather?

Dr. ALSBERG. Not for the testing of the leather, but for the investigation of the methods of producing leather.

Mr. TINCHER. Is not that included in this request for \$36,000?

Dr. ALSBERG. No. This covers general chemical tests, especially foods and drugs for other departments.

Mr. TINCHER. You are asking for \$36,000 additional appropriation. I understood you to say one reason for that is that you had a lot of extra work during the war. The war is practically over. Just what do you intend to do with the \$36,000?

Dr. ALSBERG. With that \$36,000 we expect to carry on the analytical work for the War Department, the Navy Department, the Department of Justice, the Post Office Department, the Panama Canal Commission. The Interior Department to a less extent is also asking us to do some of it. The bulk of the work consists of the analyses of food and drugs. Probably 96 per cent of it consists of the analysis of food and drugs. We get occasional requests to test samples of leather. We get from the United States attorneys or post-office inspectors occasional requests to analyze anything that happens to come up in their work just because we have a local laboratory, which is usually in the Federal building where the United States attorney is. He knows our man. He may know him well enough to call him by his first name and say, "Jim, I wish you would examine this for me because I may have to bring the matter before the Federal grand jury." He would prefer to do that to sending it in to Washington or anywhere else.

Mr. MCKINLEY. What percentage of your work is done here in Washington?

Dr. ALSBERG. Very little; almost none of it. The bulk of it is done in such places as St. Louis, San Francisco, Seattle, New York, and Boston. I should not think that more than 5 per cent of it, if that much, was done here.

Mr. MCKINLEY. Then that would be your answer as to why it is done by you instead of the Bureau of Standards—because most of the work is done at the local office.

Dr. ALSBERG. We do not overlap the Bureau of Standards. They keep off of food and drugs. The only place we overlap is occasionally an analysis for the sake of convenience when the local man wants it done locally. It is the same thing with the Bureau of Internal Revenue. Mr. Anderson is quite right; they have their own laboratory people to do that particular work, fully as competent as we are, but when the United States attorney at such a place as Seattle, or the collector of internal revenue, or the local prohibition enforcement agent, wants alcohol determined, let us say, in a sample that he has taken from some bootlegger, he would much sooner go into our laboratory, where he knows our man personally, than to express the bottle to Washington or to New York and have it done here. It is more economical for the Government in the long run to have it done that way.

Mr. JACOWAY. Will the prohibition laws which have been passed increase the work of this department very much, if any?

Dr. ALSBERG. No; they will not.

Mr. ANDERSON. The Bureau of Internal Revenue, I assume, will have laboratories established all over the country, so that it strikes me that that feature of it, if it is in consequence of that, can very well be eliminated.

Dr. ALSBERG. Of course, if they have laboratories all over the country, there will be no call for us to do any of that work. Like the leather work, this is a very small part of the work.

Mr. McLAUGHLIN of Michigan. Will you speak of the saving effected if this work be done in one department rather than several?

Dr. ALSBERG. Yes, sir.

Mr. McLAUGHLIN of Michigan. What lines of work have been or are likely to be duplicated? Tell us what the other departments are doing under that item 66.

Dr. ALSBERG. The only point I had in mind was this, that as far as I can make out the War Department at the present time is well content with the service that the Bureau of Chemistry is rendering the various depot quartermasters in analyzing their goods on contracts, foods, drugs, and medicines. If we discontinue that service they will have to establish their own laboratories. The depot quartermaster in St. Louis will have to have a chemical laboratory for his work. At the present time he is doing it in our laboratory in St. Louis, and does not want to establish a laboratory of his own, as he is satisfied with the service.

Mr. McLAUGHLIN of Michigan. There is an understanding between you that the work will not be done by them if it is done by you?

Dr. ALSBERG. Of course we can not do the work if they do not send us samples. At present they are sending us samples.

The CHAIRMAN. As a matter of economy, should not all the work on chemistry be done in the Bureau of Chemistry rather than for each department or bureau to set up a separate bureau of chemistry? When it comes to standards, that should be done by the Bureau of Standards. Would not that be the proper solution of the matter?

Dr. ALSBERG. Of course, it would be in my personal interest to say yes, but I can not agree that that is the proper solution.

The CHAIRMAN. You have 18 laboratories scattered over the country. Why should other departments build more?

Dr. ALSBERG. I am not talking about the routine work.

The CHAIRMAN. In the matter of economy. Where can we save money?

Dr. ALSBERG. Money could be saved in that way.

The CHAIRMAN. With just as efficient service?

Dr. ALSBERG. For everything except research in chemistry.

The CHAIRMAN. It is natural to assume that you have the highest skilled chemists.

Dr. ALSBERG. But my point is this: If the Bureau of Standards is carrying on a research on the strength of structural steel, it will be necessary for it as a part of the research to analyze that steel. It would not be fair to have the man who is doing the testing of that structural steel to have to send that steel to the Bureau of Chemistry for analysis. It would not be efficient to have analytical work of this kind concentrated in the manner you suggest.

The CHAIRMAN. Whenever your activities are extended to testing, then you are encroaching upon the Bureau of Standards, and whenever their activities are extended to chemistry, they are encroaching upon the Bureau of Chemistry.

Dr. ALSBERG. That is true except so far as foods and drugs are concerned. We can not enforce the food and drugs act except through the testing of foods and drugs. We do very little testing of any kind except the testing of foods and drugs, but the Bureau of Standards does not test foods and drugs.

The CHAIRMAN. We have only one Bureau of Standards and only one Bureau of Chemistry. It seems to me that the proper thing would be to refer everything to the respective bureaus, except in certain instances.

Dr. ALSBERG. I should be well satisfied if that could be done.

The CHAIRMAN. I know what is being said about duplication of work and one department encroaching upon the prerogatives of another. We want to do away with duplication if it is possible to do it.

Mr. JACOWAY. You stated that there is little duplication of work in your department.

Dr. ALSBERG. With the Bureau of Standards?

Mr. JACOWAY. In this particular department of the work.

Dr. ALSBERG. I do not think that is being done by anybody else anywhere in the Government service.

The CHAIRMAN. Why should other bureaus or departments set up a division of chemistry when there is one Bureau of Chemistry in the Department of Agriculture?

Dr. ALSBERG. As far as this item is concerned, Mr. Chairman, you are absolutely right in that statement, and the object of that particular item is to have the Bureau of Chemistry do just that kind of work and make it unnecessary for any other department to duplicate it.

The CHAIRMAN. I asked the question because there is a great deal said about duplication of work. No one is particularly to blame, but it is for somebody to work out a solution. Are you through with that item?

Dr. ALSBERG. Yes.

Mr. HARRISON. Mr. Chairman, Secretary Glass has written you a letter, concurred in by Secretary Houston, suggesting that a provision be inserted in the Agricultural appropriation bill for 1921, authorizing the transfer from the Treasury Department to the Department of Agriculture of the administration of the tea inspection act. The matter which originated with the Treasury Department and Mr. George F. Mitchell, supervising tea examiner of that department, who is here this morning, will be glad to explain to the committee the reasons for the transfer, if it is agreeable to you.

The CHAIRMAN. It is agreeable to the committee if it is agreeable to you, Doctor.

Dr. ALSBERG. Yes.

Mr. HARRISON. I think it would be desirable to insert the correspondence in the record, as it states the situation fully.

The CHAIRMAN. Yes; it will be incorporated in the record.
(The letters referred to follow:)

DEPARTMENT OF AGRICULTURE,
Washington, November 15, 1919.

THE SECRETARY OF THE TREASURY.

SIR: Consideration has been given to your letter of October 6, 1919, and inclosures, relative to the proposed transfer of the administration of an act entitled "An act to prevent the importation of impure and unwholesome tea," approved March 2, 1897 (29 Stat. 604), as amended by the act of May 16, 1908 (35 Stat. 163), from the Treasury Department to the Department of Agriculture.

In reply I have the honor to state that the department concurs with you both in respect to the proposed drafts of the bill submitted by your department, and the letters transmitting same to the Hon. Asle J. Gronna, chairman Committee on Agriculture and Forestry, of the Senate, and the Hon. Gilbert E. Haugen, chairman Committee on Agriculture, House of Representatives.

The inclosures accompanying your letter are herewith returned.

Respectfully,

D. F. HOUSTON, *Secretary.*

TREASURY DEPARTMENT,
Washington, October 6, 1919.

The SECRETARY OF AGRICULTURE.

SIR: I have the honor to refer to the correspondence conducted during the year 1914, especially your letter to this department dated February 25, 1914, relative to transferring the administration of the act of March 2, 1897 (29 Stat., 604), as amended by the act of May 6, 1918 (35 Stat., 163) from the Treasury Department in your department. In this letter your department submitted a draft of a provision based on a memorandum from the supervising tea examiner of this department for insertion in the agricultural appropriation bill transferring the administration of the tea act to your department, copy of which I inclose with suggestions from this department. All words therein which have been stricken out are inclosed in parenthesis with lines drawn through them, and all new words inserted are underscored. By referring to sections 4 and 6 of the act it will be seen that the law already states that the bonds are to be approved by the collector at the port of entry.

The changes made in the last paragraph of the provision to transfer the law simply brings the provision up to date and allows for carrying the office of supervising tea examiner on the lump-sum roll.

The office of supervising tea examiner is now a statutory position carried under the Customs Division in the legislative bill. But this department will request Congress to drop this statutory position when the transfer of the tea act has been consummated.

I am inclosing letters written to the chairman of the Committee on Agriculture and Forestry of the Senate and the chairman of the Committee on Agriculture of the House of Representatives signed by me and for concurrence in by you, requesting that the transfer of the tea act be made and giving reasons for same.

Respectfully,

CARTER GLASS, *Secretary.*

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
Washington, September 29, 1919.

Hon. GILBERT N. HAUGEN,
*Chairman Committee on Agriculture,
House of Representatives.*

MY DEAR CONGRESSMAN: Inclosed you will find a draft of a provision prepared jointly by the Agricultural Department and my department which I would recommend be inserted in the agricultural appropriation bill for the fiscal year 1921. This provision provides for the transfer of the administration of the act of March 2, 1897 (29 Stat., 604), as amended by the act of May 6, 1918 (35 Stat., 163), from the Treasury Department to the Agricultural Department. No changes are made in the act itself except those of an administrative nature.

This act prohibits the importation of any merchandise, as tea, which is inferior in purity, quality, and fitness for consumption, to standards to be fixed and established annually by the Secretary of the Treasury, and provides that such merchandise finally determined to be inferior in purity, quality, or fitness for consumption to such standard shall be exported, provides for a physical standard of quality as well as purity. The reason for this is because tea must have a standard of quality if it is to be successfully guarded as a food product, as it is possible to have an absolutely pure tea and yet it might be unfit for consumption. The commercial teas are made from the tender leaves of the tea plant. These young leaves contain the stimulating alkaloid caffeine and a

complex constituent which gives the commercial teas their value and flavor. It has been determined that the lower leaves of the tea bush not only have practically no stimulating value but increase materially in tannin, the injurious and deleterious constituent of tea, so that if we did not establish a standard of quality as well as purity it would be possible to import tea made from these lower leaves which, while pure, would be absolutely devoid of any real tea flavor and which at the same time would be so strong in tannin as to be unfit for consumption.

In other words, although all tea is made from the leaves of the tea plant, all tea leaves that are made into tea can not be considered as commercial tea, and to prevent the United States from being the "dumping ground" that it was before the present law was enacted, Congress very wisely passed the present tea act which requires all teas entering the country to be measured by the physical standard that represents the minimum of quality. This law, besides protecting the consumer against spurious adulterations and inferior goods which lack the requisite quality to make them of value as a beverage, also protects the merchant against the flood of worthless trash that would destroy his market.

In viewing the foregoing paragraphs and after studying the history of acts of this kind which I will review in the following paragraphs, I am convinced that your committee will desire to secure legislation which will effect the transfer of the administration of this act to the Agricultural Department, where all acts of this kind are now administered and where I believe this one rightfully belongs.

As nearly as I can determine, the first legislation conditioning the right of importation upon purity, quality, and wholesomeness of merchandise is contained in the act of Congress approved June 26, 1848 (U. S. Stat., vol. 9, p. 237), entitled "An act to prevent the importation of adulterated and spurious drugs and medicines." By the terms of this act the customs service of this department is charged with its enforcement.

Probably the next legislation of this kind was the act of Congress approved March 2, 1883 (U. S. Stat., vol. 22, p. 451), entitled "An act to prevent the importation of adulterated and spurious teas." The customs service of this department was also charged with the administration and enforcement of the provisions of this act.

The next legislation directed to the prevention of the importation of impure, adulterated, and unwholesome merchandise is contained in the act of Congress approved August 30, 1890 (U. S. Stat., vol. 26, p. 414), entitled "An act providing for the inspection of meats for exportation, prohibiting the importation of adulterated articles of food and drink, and authorizing the President to make proclamation in certain cases, and for other purposes." Under the terms of this statute, the Secretary of Agriculture is charged with its enforcement so far as it relates to the exportation of meats, and the Secretary of the Treasury is charged with its enforcement so far as it relates to the importation of adulterated articles of food and drink.

The next legislation on the subject is contained in the act of March 2, 1897, supra, which took the place of the tea act of 1883, above referred to, and which was continued under the jurisdiction of the Treasury Department, and the next is the Agricultural appropriation act of March 1, 1889 (U. S. Stat., vol. 30, ch. 325, p. 951). This latter act authorizes the Secretary of Agriculture to investigate the adulteration of foods, drugs, and liquors and prohibits the importation of such articles when found to be dangerous to the health of the people of the United States.

The last-mentioned act seems to mark a change in the policy of Congress with respect to the enforcement of legislation directed to the prevention of the importation of spurious, adulterated, impure, unwholesome, and misbranded foods, drugs, and liquors, for in all such legislation prior to this act the Secretary of the Treasury is charged with its enforcement, whereas in the said act the Secretary of Agriculture is given jurisdiction.

The act of August 30, 1890, was followed by the acts of May 25, 1900 (U. S. Stat., vol. 31, ch. 555, p. 196); March 2, 1901 (U. S. Stat., vol. 31, ch. 305, p. 930); June 3, 1902 (U. S. Stat., vol. 32, ch. 985, p. 296); March 3, 1903 (U. S. Stat., vol. 32, ch. 1008, p. 1157); April 23, 1904 (U. S. Stat., vol. 33, ch. 1486, p. 288); March 3, 1905 (U. S. Stat., vol. 33, ch. 1405, p. 874); June 30, 1906 (U. S. Stat., vol. 34, p. 686).

The successive statutes gradually broaden the scope of governmental control and supervision over the importation of foods, drugs, and liquors, and in each of them the Secretary of Agriculture is given jurisdiction to determine the purity, quality, and wholesomeness of such articles offered for importation, and whether they shall be permitted to enter into consumption in the United States.

The situation is that under existing statutes the Department of Agriculture has jurisdiction to determine the fitness for human consumption and admissibility of all foods, drugs, and liquors offered for importation into the United States, with the single exception of tea, jurisdiction over which remains partly in this department, under the act of March 2, 1897, and partly in the Department of Agriculture, under the food and drugs act of June 30, 1906 (26 Op. A. G. 166). In this opinion the Attorney General shows that no repugnancy exists between the special tea-inspection act of March 2, 1897 (29 Stat., 604) and the general food and drugs act of June 30, 1906 (34 Stat., 768), preventing them from standing together, and that an importation of tea is, therefore, subject to both acts in that it must equal the standards of quality and purity established by the Secretary of the Treasury under the tea-inspection act and is also subject to the provisions of the food and drugs act regarding adulteration, labeling, misbranding, and guaranty.

In the opinion of this department both of these acts are necessary to safeguard the public in the matter of tea, and, while the one can not be substituted for the other, as they deal with tea in different particulars, at the same time, if the administration of the tea law were placed under the Department of Agriculture the work could be coordinated in the department in which this class of work properly belongs.

If your committee has any doubts as to the advisability of this proposed course or desires information, this department will be glad to have a representative familiar with the matter appear before the committee.

A similar letter has been addressed to the chairman of the Committee on Agriculture and Forestry of the Senate.

Respectfully,

CARTER GLASS,
Secretary of the Treasury.

I concur.

D. F. HOUSTON,
Secretary of Agriculture.

The Secretary of Agriculture shall, from and after the taking effect of this act, execute and perform all the powers and duties conferred on the Secretary of the Treasury by the act approved March 2, 1897 (29 Stat. L., p. 604), entitled "An act to prevent the importation of impure and unwholesome tea," as amended by the act approved May 16, 1908 (35 Stat. L., p. 163), entitled "An act to amend an act entitled 'An act to prevent the importation of impure and unwholesome tea,' approved March 2, 1897": *Provided*, That the bonds given to the United States as security in pursuance of section 1, as amended, shall be subject to the approval only of the collector of customs at the port of entry; that in place of the board of United States general appraisers provided for by section 6 of the act, there shall be designated by the Secretary of Agriculture three employees of the Department of Agriculture to serve as the United States Board of Tea Appeals with all the powers and duties conferred by the act on the board of United States general appraisers. There is hereby appropriated, out of any money in the Treasury not otherwise appropriated, the sum of \$45,000 for carrying into effect the provisions of the aforesaid act until the end of the fiscal year ending June 30, 1921, including payment of compensation and expenses of the members of the board appointed under section 2 of the act and all other necessary officers and employees.

STATEMENT OF MR. GEORGE F. MITCHELL, SUPERVISING TEA EXAMINER, TREASURY DEPARTMENT.

The CHAIRMAN. You may proceed, Mr. Mitchell.

MR. MITCHELL. Several years ago Secretary McAdoo suggested to the Agricultural Department that the tea-inspection act, which deals entirely with the testing of imported teas, or teas entered at

the ports for consumption, for purity, quality, and fitness for consumption, be transferred to the Agricultural Department, as it has nothing to do with revenues. There is no duty on tea at the present time. This matter was postponed, due to the fact that at the time there was pending in the courts a case testing out whether a certain test that we were using was legal or not. The Secretary of the Treasury asked the Secretary of Agriculture to postpone it when that case came up. The case has been settled by the Supreme Court, and now the Secretary of the Treasury, Mr. Glass, has asked the Secretary of Agriculture if his department was willing to take over this work, which is more in line with the functions of that department. It is more in line with the pure food law, and the Secretary of Agriculture has concurred in the letter to this committee. A similar letter has also been addressed to the Committee on Agriculture of the Senate.

Mr. ANDERSON. AS I understood this tea proposition, the testing of tea has no relation to any rate of duty?

Mr. MITCHELL. None whatsoever.

Mr. ANDERSON. If the tea does not come up to the standard, which I think a commission was set up to fix, it is simply refused entry?

Mr. MITCHELL. It is refused entry by the examiner, but the importer has the chance to appeal to the Board of Tea Appeals, and then, if it is finally rejected by the Board of Tea Appeals, the importer has six months in which to export the tea. If not exported within six months, then it is destroyed; it is mandatory that it shall be destroyed.

Mr. ANDERSON. It is purely a pure-food matter, with no relation to the importation of tea?

Mr. MITCHELL. It is entirely a pure-food matter, and the main point I want to bring out is that it can not be handled in the best way under the pure-food law, for the pure-food law does not regulate quality or grade. This board, under the act of 1897, annually establishes physical standards, actual tea standards, of both purity and quality. If we were to do away with this act and let it automatically drift under the pure-food law we would not be able to test for quality. The reason why tea differs from some other food products is that we have to test for quality. It is due to the fact that if the tea leaves that are made into tea are not picked from the uppermost part of the shoots—if they should happen to pick them lower down, which there is a tendency to do, because the leaves lower down are larger and have more weight—such leaves would be lacking in the tea quality and yet would be absolutely pure and be allowed to enter this country under the pure-food law; but they would not be considered commercial tea as I would consider commercial tea, or any other tea man would consider commercial tea. The procedure that we have under this act is to test all teas at seven different ports by expert examiners. These men are qualified in testing teas. The tea entering the country is drawn in comparison with the Government standard, and generally in blind, so that the examiner is not biased in any way, and if it does not equal the Government standard the tea is rejected by the examiner.

Mr. McLAUGHLIN of Michigan. What ports are they?

Mr. MITCHELL. We have examiners stationed at New York, Boston, Chicago, St. Paul, Tacoma, Wash. (which we call the Puget Sound port), San Francisco, and Honolulu. The way we divide the districts is simply automatic. If the tea should come into a port where there is no qualified tea examiner, then he sends it to the nearest port where there is a qualified tea examiner, so that the United States is divided automatically in that way into different districts.

Mr. McLAUGHLIN of Michigan. How large a force have you at each one of these places?

Mr. MITCHELL. At each of these places we have a qualified examiner, and at two of the ports these examiners have assistant examiners, and then we have at some of the other larger ports (for instance, three out of the seven), we have a clerk and messenger who tends to putting the water on the tea and things of that sort. We also have to have samplers. The average number of samplers is about one at each port. The samples are not drawn under the supervision of the Government, and teas entered for consumption are placed in a bonded warehouse and kept there by the Government under bond until our samplers go and see the sample there, and these samples drawn by the samplers are submitted to the tea examiners for testing in comparison with Government standards.

Mr. MCKINLEY. Are these men under civil service?

Mr. MITCHELL. All these men are under civil service, and all except myself go on the lump-sum roll. I am on the statutory roll.

Mr. McLAUGHLIN of Michigan. In the Treasury Department?

Mr. MITCHELL. Yes, sir.

Mr. HEFLIN. What salary do you get?

Mr. MITCHELL. \$2,750 a year.

Mr. TINCHER. As I understand it, your department is in the Internal Revenue Bureau?

Mr. MITCHELL. It is in the Customs Department.

Mr. TINCHER. The reason that you should not have anything to do with this is that there is nothing chemically wrong with the tea, except if they pick the leaves too long, it is weak tea?

Mr. MITCHELL. Yes.

Mr. TINCHER. The object of having the tea taster is to get strong tea?

Mr. MITCHELL. It is weak if it is picked from the lower part of the bush and does not contain the caffeine and aromatic oils that give it flavor.

Mr. TINCHER. That would not be detrimental?

Mr. MITCHELL. Not detrimental as to quality.

Mr. TINCHER. If a man bought tea that had not been tested he would simply get weak tea and we have to have these employes at these stations so that we are able to get good strong tea?

Mr. MITCHELL. Another reason is that we also test for purity.

Mr. TINCHER. These civil service men that you have besides the inspectors, do they test them as to their tasting qualities?

Mr. MITCHELL. Yes, sir; we do. We hold an examination from time to time, and we select samples that are very near the Government standard or equal to or better than the Government standard; and we actually have the applicant go through the examina-

tion, and he also has to be able to tell the different districts in the country that the tea comes from, so that he can tell what standard to use in the testing of the teas.

Mr. MCKINLEY. Is it not true that every big importing house has a tea taster?

Mr. MITCHELL. A big importing house has a tea taster.

Mr. HEFLIN. These tasters use the test to get the best quality of tea?

Mr. MITCHELL. To get the quality of good commercial tea.

Mr. HEFLIN. And but for that we would get low-grade tea?

Mr. MITCHELL. Such a low-grade tea would be absolutely trash and would not be what is known as commercial tea. Then we also test for purity. I do not think there is any important food product that is more subject to sophistication than tea. It has been in the past. They used a lot of coloring matter for tea, to make 20 per cent tea look like 40 per cent tea. That also comes under this law.

Mr. HEFLIN. You detect that and call attention to it?

Mr. MITCHELL. We not only call attention to it, but we reject the tea and have it sent outside the country. We have not had any rejects in the past six months.

Mr. HEFLIN. You protect the American people from that weak tea?

Mr. MITCHELL. This tea inspection is similar to the milk inspection in certain cities, which requires that milk contain a definite per cent of butter fat. That milk may be absolutely pure and some butter fat might be taken out unless you had these laws against the reduction of the butter fat. It is exactly the same way with tea. It is a little different from other food products. It differs from coffee; no matter what coffee bean you have you get everything in that coffee bean. It might be grown at a low altitude, it might be poor coffee, but you get everything in that coffee bean. That is not true of tea; you must have the tender leaves of the plant in order to make a good commercial tea.

Mr. McLAUGHLIN of Michigan. Do you serve for examining coffee, too?

Mr. MITCHELL. No, sir; coffee comes under the pure-food law.

Mr. McLAUGHLIN of Michigan. In this service are you employing anybody in foreign countries from which the tea comes?

Mr. MITCHELL. No, sir; we do not. The department sent me on a trip to foreign countries, but that was the only time we had anything to do with foreign countries. That was simply for the purpose of studying methods.

Mr. McLAUGHLIN of Michigan. Do you know how many have been employed in the service altogether in this country?

Mr. MITCHELL. At the present time?

Mr. McLAUGHLIN of Michigan. Yes.

Mr. MITCHELL. I can tell you roughly. We have seven examiners and the supervising tea examiner, making eight; two assistant examiners; we have about three clerks and about nine samplers.

Mr. McLAUGHLIN of Michigan. How much money has been devoted to this work in any year recently?

The CHAIRMAN. You are asking for \$45,000. Is that the amount previously carried?

Mr. MITCHELL. I was going to explain that. The lowest actual amount that would be expended in the transfer, I estimate, would be

\$40,716.30. The amount that I have added on is the amount that I estimate would be necessary in making the transfer.

The CHAIRMAN. It would cost \$5,000 to make the transfer? You are asking for \$45,000 now?

Mr. MITCHELL. I am asking for \$45,000.

The CHAIRMAN. You have been expending about \$40,000?

Mr. MITCHELL. \$40,716.30. That represents what it would actually cost us to carry on the thing in the Department of Agriculture as it is now. For instance, we have a man at Honolulu who gets \$2,200 a year, and his services are divided between customs work and the tea work. In that case I have estimated the very lowest that we could get a man there for, probably \$1,500, which would be the very lowest estimate. That is a small place.

The CHAIRMAN. Do I understand it would cost more in the Department of Agriculture than it would cost in the Treasury Department?

Mr. MITCHELL. Perhaps the first year we move it over, before we get shaken down. I might be able to find a man to do the same work in the Bureau of Chemistry, or Dr. Alsberg might be able to get a man at Honolulu to do that. We have got to have a man there.

The CHAIRMAN. What is the object of the transfer? I supposed it was to save money?

Mr. MITCHELL. The object of the transfer is, as the Secretary of Agriculture states in his letter, that as this does not bring in any revenue to the Government, and as it is purely a policing measure to keep teas that are not up to quality and purity out of the country, it should be placed under the department that handles similar work. That is the reason for asking this committee to transfer this work.

The CHAIRMAN. I assume the same force would be transferred. Why should there be an increase in expenditures? There are people now employed who are paid jointly out of other funds.

Mr. MITCHELL. There will not be, perhaps, an increase the second year, but the first year I can not take a man to Honolulu that is in the Bureau of Chemistry. I can not find anybody for testing teas.

Mr. McLAUGHLIN of Michigan. Why can not the same individuals, the same force, be transferred from one roll to another—from one jurisdiction to another?

Mr. MITCHELL. The proposition is to transfer every man that is in the service now, except in a place like Honolulu, where the man is a weigher and is also a tea examiner.

Mr. McKINLEY. You are trying to tell us that the man at Honolulu is doing other work in the Treasury Department?

Mr. MITCHELL. Yes; he gets \$2,200 for doing that and other work. If you transfer that law to the Department of Agriculture in that one case where he is doing double work, we will have to find somebody to do the tea work.

The CHAIRMAN. Is it not possible for the departments to cooperate?

Mr. MITCHELL. I do not think that under the law we could divide a man's salary between two departments if he gets more than a certain minimum salary—\$2,000, I think.

The CHAIRMAN. According to your statement, it would cost the Government about \$4,300 to make the transfer?

Mr. HARRISON. The man in Honolulu would not get \$2,200 for doing merely the weighing work after the tea work is taken away. His compensation would be reduced, would it not?

Mr. MITCHELL. He probably will be reduced, but I can not take the money out of the Treasury Department after I leave. The only thing we can do is to put a man there from the Agricultural Department, perhaps at \$1,500.

The CHAIRMAN. Is it proposed to transfer this force to the Department of Agriculture?

Mr. MITCHELL. That is what the Secretary of the Treasury has requested, and the Secretary of Agriculture has concurred in the request.

The CHAIRMAN. It is not so stated in the draft submitted. It states that they shall be paid the compensation in existence under section 2. What is that board?

Mr. MITCHELL. If the tea is rejected by the tea examiner, then the importer has the right within 30 days to appeal to the Board of Tea Appeals. This Board of Tea Appeals now is composed of three men drawn from the Board of General Appraisers. This proposition here is to appoint three men. We simply designate three men without salary from the Agricultural Department. It might be three men designated from New York, from the New York laboratory, by Dr. Alsberg, to assist in the cases coming up. This board seldom sits.

Mr. HUTCHINSON. This man to whom you say you pay \$2,200, is that charged up to your appropriation?

Mr. MITCHELL. No, sir; it is charged up to the customs.

Mr. HUTCHINSON. It is not charged to that appropriation?

Mr. MITCHELL. No, sir. This tea law has no special appropriation at this time. It simply is under the full customs appropriation.

Mr. HUTCHINSON. You say you have been getting \$40,000?

Mr. MITCHELL. I say we have been spending that much of the customs appropriation.

Mr. HUTCHINSON. Does that include the \$2,200?

Mr. MITCHELL. No, sir; it does not.

Mr. HUTCHINSON. In other words, the work you are going to do there on the tea question is in three groups?

Mr. MITCHELL. No, sir; \$1,500 I estimate should have been charged against tea.

Mr. HUTCHINSON. Is it charged against tea in your appropriation?

Mr. MITCHELL. I have no appropriation.

Mr. HEFLIN. He is asking for it now.

Mr. MITCHELL. If the work is transferred, the Department of Agriculture will ask it.

Mr. HEFLIN. You certainly get some from the Treasury Department?

Mr. MITCHELL. We have from a lump fund of \$10,000,000.

Mr. JACOWAY. Up to the present time it has been costing \$40,000 for this work?

Mr. MITCHELL. Yes, sir.

Mr. JACOWAY. In order to transfer it to the Department of Agriculture, which should have jurisdiction of it, it will cost \$45,000, a difference of \$5,000?

Mr. MITCHELL. I did not say it would cost that. I am asking for that because in making the transfer we should have some money for leeway. We might not spend it.

Mr. JACOWAY. Would it be worth \$5,000 to the American people and the taxpayers to get this out of the Treasury Department and into the Agriculture Department? That is what the committee wants to know. Would the public benefit that much in the transfer?

Mr. MITCHELL. The idea of making this transfer did not originate with me, and the persons who actually made the request could doubtless answer that question. The Secretary of the Treasury directed me to prepare a letter asking the Secretary of Agriculture if he would agree to this transfer.

Mr. HUTCHINSON. Do you know whether the Secretary of the Treasury will ask for a reduction of \$45,000 in his appropriation?

Mr. MITCHELL. I do not know.

Mr. HEFLIN. Do you think this transfer would be beneficial?

Mr. MITCHELL. I really do not think it would make very much difference. I think the law can be operated in one department as well as in another.

Mr. LEE. It merely puts it where it belongs?

Mr. MITCHELL. The idea is to put it where it belongs.

The CHAIRMAN. It occurred to me that the Bureau of Chemistry could conduct this work with less money in connection with its other work along that line, but according to your statement it is going to cost more. I thought at first this proposition was in the line of economy.

Mr. MITCHELL. It will coordinate the work. For instance, in the pure food department from time to time they collect samples to see that interstate shipments are all right, and if we were transferred over to the Agriculture Department, of course, we could handle that.

The CHAIRMAN. I thought that it could be done at less expense in conjunction with the other activities of the bureau.

Mr. MITCHELL. Yes; I believe so.

The CHAIRMAN. The statements here do not bear that out.

Mr. MCKINLEY. Is it not true that they asked you something about an appropriation and you estimated it at \$45,000, but that it might possibly be less than \$40,000 when you get them consolidated?

Mr. MITCHELL. Yes; I simply made an estimate. I found out how much it costs now, and I added \$5,000.

Mr. MCKINLEY. The cost for the present year is \$40,700, and you are asking for \$45,000.

Mr. HEFLIN. Do you think it would be beneficial to have that transfer made?

Dr. ALSBERG. I believe it would be beneficial because I believe when we get this over we can save some money. We have offices and laboratories in every place where there is a tea examiner. We have to have clerks, for instance, in New York, about 6 clerks doing our work in a laboratory with 30 chemists. It is entirely possible that we could save clerical hire and other personal services.

The CHAIRMAN. How much would you say?

Dr. ALSBERG. I would not say until the transfer has been made for a year. I am totally unfamiliar with this matter and am unable to say how much could be saved. I should think it ought to be possible by combining this work with other projects to make savings after we tried it out.

Mr. HEFLIN. Is it your judgment that the change is desirable and advisable?

Dr. ALSBERG. It is my judgment that the change is desirable and advisable, because the Department of Agriculture is really where the work belongs. It is a stepchild in the Treasury Department. I think this work is being done efficiently in the Treasury Department. I think Mr. Mitchell would continue to do the work in the same manner no matter where he was located, but we are dealing with the same group of importers, who are usually also importers of spices and other things, and it would be beneficial to the department and to the trade to have only one set of Government officers to deal with where they have two sets at the present time. I think when we get the work welded together we could probably save some money, but I would not venture to say how much.

The CHAIRMAN. Would the inspection of tea require the services of specialists that you have in the department, or could they do other work in conjunction with the inspection?

Dr. ALSBERG. The examination of tea, as I understand it, requires the services of specialists. We have not at the present time in the Bureau of Chemistry such specialists. It is possible, of course, that all of the time of these tea examiners is not taken up completely in every place with their examinations, and that we could get them other things to do in addition.

The CHAIRMAN. Would he be competent to inspect spices?

Dr. ALSBERG. We could probably use them to inspect other things, but we could not get along without men especially trained in the testing of teas. As I understand Mr. Mitchell's contention, men

Mr. MITCHELL. If we are allowed to swap over I can conscientiously who have held the position of tea testers for commercial concerns before they came into the Government service. No one who has not had that training or experience is competent to do this work, but we might be able to use them also for spices and other things.

The CHAIRMAN. You do not state definitely that they could be.
